The course of instruction extends over four years. In the first term the pupil in the binding class is taught all that it is necessary to know about the raw materials used in the trade. Next term he gets on to half-bindings in calf and other ordinary materials, and in the term following is initiated into the higher grades of his art, such as full-bindings in morocco. At the end of this term the pupil is expected to be able to execute any usual class of binding, from ordinary board covers to high-class work. The fourth term is largely devoted to a sort of review of the class work of the previous three, in order to ensure that the pupil shall be thoroughly grounded in his trade. Similarly, the finisher (*doreur*) is taken through every phase of that important branch, from a consideration of the nature and properties of gold leaf, and the like, to the lofty elevation of mosaic inlays.

As regards design, this is of course of more value to the finisher than to the forwarder, but nevertheless the latter is instructed in the art of drawing straight lines, or compositions made up of such. The lectures on the History of the Book cover the ground fully, and deal with most of the arts employed in bookmaking, from the earliest times down to the present, also treating of such subsidiary matters as types, paper, illustrations, etc.

By the courtesy of M. Malevè, we are enabled to illustrate a few specimens of binding executed by the pupils of this school. Appropriately enough. four out of the five are works dealing with the art of bookbinding. The largest illustration represents a copy of Lenormand's "Manuel," and the style of cover decoration adopted is, it will be seen, quite a modern one. It is executed in brown morocco, and like all the other bindings illustrated, the design was entirely composed and carried out at the School.

Of the bindings seen in the smaller pictures No. 1 is a copy of the same work, and its cover design is, to a small extent, reminiscent of the other, although approaching nearer, perhaps, to a style very popular among English binders in the thirties and forties, than to any professedly modern one. This volume is in green morocco, as are also—though in darker shades—Nos. 2 and 3. The former, Coster's "Legendes Flamandes," is decorated to a simple sixteenth century pattern, quiet and dignified. No. 3, again, though it possibly had its prototype in nearly contemporary French work, recalls some of the English bindings of the forties. It is, however, described as being in the "Empire" style, and is a copy of Lesne's "La Reliure."

No. 4 is certainly decorated on modern lines, and makes its appeal to the artistic eye mainly because of its freedom from any of the elaboration that characterises so much of the school work on our side of the Channel. It is in blue morocco.

It will be evident from these examples of the work of L'Ecole Professionelle de Reliure that it has some thoroughly capable craftsmen on its class lists. We offer our congratulations to M. Malevé and his staff on the high-class nature of the work carried out at their School, and trust to have the opportunity of illustrating further examples of it from time to time.

MESSRS. TAYLOR BROS., the well-known colour printing firm of Leeds, have, with characteristic enterprise, just prepared a fine advertising sheet or wall calendar commemorative of the loss of five of the members of the Antarctic Polar Expedition. In the centre of the picture is a fine portrait of the intrepid leader, Captain Scott, and at each side are illustrations of the "Terra Nova" and the Great Ice Barrier. In the left hand upper corner is an oval portrait of Captain Oates. and on the right hand one of Dr. E. A. Wilson, whilst between them is an illustration of Captain Oates leaving the tent to meet death like "a brave English gentleman." The two lower panels contain portraits of Petty Officer Evans and Lieutenant H. R. Bowers. Pendant to the principal oval is a shield, bearing upon it an extract from Capt. Scott's rough notes. The portraits are printed in black ink, and the illustrations and ornamental background of laurel, oak leaves, etc., are in a shade of subdued green on superfine enamel paper. The sheet measures 22½ by 17½ inches, there being a space at the bottom for printing in an advertisement, and a calendar for 1913 if required. Wood mounts are fixed if desired.

Printers' Managers and Overseers ASSOCIATION.

MANCHESTER AND DISTRICT CENTRE.

An Interesting Talk About Trade Journals.

There was an exceptionally large attendance of members at the Crown Hotel, on Saturday evening, 8th inst., when Mr. Thomas Shaw, the first president of Manchester Centre, delivered an interesting lecture on "A Talk about our Trade Journals and their influence on the art of Printing."

Mr. Shaw prefaced his remarks by saying that his audience would find on the tables, for their inspection, recent issues of the *Printers' Register*, the *British and Colonial Printer and Stationer*, the *British Printer*, the *Caxton Magazine*, the *Modern Lithographer*, the *Irish Printer*, *Process Work*, *Process Engravers' Monthly*, *Stationery Trades' Journal*, *Printers' Engineer*, *Caslon's Circular*, *L. and M. Record*, *Monotype Recorder*, *Swain's Quarterly*, upwards of 20 American and other foreign trade journals, and also several bound volumes of the *British Printer*. *Hailing's Circular*, the *Paper and Printing Trades' Journal* the *Printing World*, the *British and Colonial Printer*, the *American Art Printer*, and the *Printers' International Specimen Exchange*. He then said:—If the question was put to me, "What, in your opinion, has been the greatest factor in the advancement which has been made in the Art of Printing during the last 35 years?" I should unhesitatingly reply, "The service of the trade journals." The fact that the young printer of to-day has at hand such a large number of well-informed and practical trade journals, many of them demonstrating the latest discoveries and inventions, together with examples of printing by men of outstanding ability—this fact, I say, places the young printer in a vastly more advantageous position than were those in his circumstances

A Generation or Two Ago.

I make bold to affirm that from 1877 to 1912—35 years—there was greater fertility of inventive genius manifested in the printing and allied trades than in any 70 previous consecutive years. And that advance has not been confined to any one section of the reproductive arts. It applies equally to newspaper growth, to general printing, letterpress and lithographic, and also to photography and pictorial illustration. What an impetus to the latter the half-tone process has been!

In passing, let me briefly refer to an interesting fact, which, although it has little to do with my subject to-night, is nevertheless closely allied to any review of progress made in printing during the period just referred to. Thirty-five years ago the Education Act of 1872 had just begun to shed its beneficent influence upon the young life of this nation. Contrast for a moment in your minds the difference between our adult population *then* and *now*, as regards their indulgence in reading, let alone their desire or ability to acquire knowledge in the other arts. What an immense boom the ability of the people to read has given to the publishing trade!

What a difference there is to-day in the output of books, magazines and newspapers to 35 years ago. How few homes, in those days, "took in" the evening paper, whilst the morning paper was to be found only in the homes of the more or less well-to-do people. This is not a picture of the days "when George the Third was King," but of our own times, well on in the reign of Victoria the Good, the beginning of the last quarter of the nineteenth century!

Printing Trade Journals.

It is not my intention to attempt to give even a brief history of our trade journals, for that could only be written by one who had access to sources of information not at my command. It may be of interest to you to know that so far back as 1879 there was compiled a list of 117 journals devoted to the printing, stationery, bookselling, newspaper and kindred trades, of which 13 were published in this country. My modest talk to you to-night will be about a few trade journals, those which have made the greatest impression upon me, and been a source of help to me during what is beginning to appear a long span of life spent in close contact with Printers' Ink!

The title of the first trade journal which attracted my attention when in my "teens" was the *Paper and Printing Trades' Journal*, a quarterly established in 1872 by Mr. Andrew W. Tuer, a reviver and enthusiast of the old style in printing, an author of considerable repute, and at that time the surviving principal of the firm of Field and Tuer, the Leadenhall Press, London. The editor, in introducing the first number, said that "he believed, that amongst those who would con over the journal's pages there would be thousands who have some special bit of information or 'wrinkle' that would be of service generally if made public. . . . Who knows what

Diamonds may be Unearthed?"

It was the original plan to depend upon the advertisers to entirely defray the cost of the journal, but so great was the demand for it, that in the third issue—June, 1874, an appeal for a subscription of 1s. per year was made, which, as the paper grew in bulk, did not do much more than pay the postage. In 1881, when the journal was in the zenith of its popularity. the price was increased to 2s. per year, aad the circulation was not far short of 20,000 per issue. Mr. Tuer owned the paper for 19 years, but to Mr. Robert Hilton must be given the honour for making the journal such a phenomenal success. Mr. Tuer was editor in name, Mr. Hilton in reality. Mr. Hilton left it in 1888, and started the *British Printer*. Mr. John Southward shortly afterwards took over the journal, and purchased the property in 1891, but it had seen its day. Causes which need not be referred to now led to its decline: and in a short time the *Paper and Printing Trades' Journal*, whose appearance had been accustomed to welcome acclamation from thousands of expectant printers, ceased to be. One lingers "in affectionate remembrance" over one's recollections of an old friend. In my youth it was the best I had in the printing office. Anything I have done, as a printer, I owe to its inspiration. Its motto—the Shakespearian quotation from Cymbaline, "Stick to your Journal," at the head of every page of its literary matter, was surely unneeded, for I cannot imagine that anyone, once a subscriber, would lapse. And to-day I find one of my greatest pleasures in turning over the leaves of my old favourite.

Magnetic Features.

What, do you ask, were the magnetic features of the journal? It was readable from beginning to end; cleanly and closely printed, the text in old style, and the advertisements freely ornamented with old style initials, etc., on a toned fine printing. Its answers to correspondents were an education in themselves, being more in bulk and variety than I have ever seen in any other printing publication. Its humorous "Quads" were not the least of its attractions, and one enjoyed a hearty laugh over the escapades of "Our Boy Bill." A splendid series of trade tables was compiled, and one appeared in each issue. The reviews of specimens, some of which were sent in by the finest printers in the United Kingdom, Germany and America, were intelligibly descriptive; an artistic production was sometimes reproduced, whilst a "blood curdler" was fearlessly held up to derision; and the printers of jobs of average ability had their little faults pointed out, whilst at the same time a word of encouragement was given for indications of correct taste and good effect.

Amongst the contributors of specimens to the journal was Thomas Hailing, of Cheltenham, who in 1879 suggested the idea of

The Printers' Specimen Exchange.

The journal took it up, and offered itself as publisher. The first volume of the Exchange appeared in 1880, and contained about 170 specimens. For sixteen years it continued, the number of contributors more than doubled, and the Specimen Exchange undoubtedly stimulated English printers—both employers, men and apprentices—to a higher conception of art in printing.

Thomas Hailing was a master printer who, by 1877, was well-known to the trade as an artistic printer, one of the best, if not actually the foremost, in England. Much of his work bore the stamp of originality, to a marked degree in posters. A very effective style was a toned printing paper, of good weight, the job being set in old style, with the larger lines in Old English or other black letter, the whole relieved by a few initials, or a line or two in red, the remainder in a more subdued colour, not always black. I should imagine Thomas Hailing was the first to import American end grain and other types into England. In 1877 he issued the first number of his *Circular*, which, as he afterwards wrote, was "first intended for circulation amongst his customers, to lay before them the elementary principles of the Typographical Art." The demand for copies came from all over the country, and he was soon compelled to charge 1s per year for it. But notice Mr. Hailing's thoughtfulness and kindness in making the announcement. He wrote: "We were prepared to issue quarterly from 1,000 to 1,500 copies, but the requests to be placed on our list have grown to such proportions . . . Among those who write for copies are not a few 'prentice hands, to whom a shilling is a thing of importance. As, however, we are anxious to reach those who are growing up to become the printers of the future, we promise to forward their copies as hitherto, and sincerely hope that, in whatever part of the world their lot may be cast, they will allow the little light shed by our *Circular* to lead them onward to the accomplishment of

More Meritorious Doings."

The first number of *Hailing's Circular* consisted of 4 pp., the size being royal 4to. It never became a bulky publication, reaching at the most 12 pp. In nearly every issue the first page consisted of an article set in a complete series of type, beginning with the largest and ending with the smallest size. Mr. Hailing always emphasised the advantage of laying in type faces in series. This article was invariably good reading and instructive. Not many specimen pages were shown, but the *Circular* was filled with short pars culled from other trade journals, home and foreign, introduced by a few pithy comments by the editor, Mr. William Hailing, then the overseer of the composing department. The spring number of 1887 appeared entirely printed in gold in honour of the Jubilee year of the reign of Queen Victoria. The following extract from "Our Tribute" is well worth quoting: "During her Majesty's reign of fifty years our art has advanced with such rapid strides that the previous 350 years seem almost sunk into oblivion, and become 'as a tale that is told.' Thanks to our far-seeing statesmen, we have secured a *free* press, and now we must ask them to help us to a *pure* press—to put to shame the retailers of scandal, vice, and horror and all uncleanliness—and compel them to hide their diminished heads in the dark places of the earth. May the public press become uplifting in its tendency and truly noble in its aspirations; and while firmly claiming the *rights* of man, still insist with all its might upon giving the first and foremost place to DUTY. Duty to God, to Country, and to Family. In the hope of seeing in our day some advance towards this righteousness, we lay our humble tribute at our Sovereign's feet." *Hailing's Circular* ceased to appear in 1889, but for 12 years it had contributed no mean share to the advancement of the beautiful in the art of printing in this country. It was my privilege to pay a visit to Mr. Hailing's works in 1886, and I received a cordial welcome and spent a profitable hour with him.

Lack of Litho Support of Trade Journals.

It appears a strange thing to me that the litho section of the reproductive arts has never sustained a really first-class trade journal. In my youth there was the *Printing Times and Lithographer*, a monthly 4to, published by Wyman and Sons, and which devoted much of its space to litho matters. Since that time efforts have been made to establish a journal entirely devoted to the process, once by the publishers of the *British Printer*, but none have survived except the *Modern Lithographer*, which, although now in its ninth year, consists of very few pages. This fact is one for which the trade is entirely to blame; it is certain that the owner of the paper would give more if he was supported as he ought to be. I cannot but give voice to my opinion that the lithographic trade as a whole—employers and workmen—has failed to rise to its opportunities in its neglect to support and thereby benefit by the help which a well-supported journal would have afforded. There are practical lithographers who can "write up" trade subjects and present them in quite as attractive a style as do their brethren in the letterpress section, but they lack support from the rank and file. "grease and water" friend of mine has given me this explanation why a litho trade journal has never become what it ought to be. It is because it has to be mainly produced by letterpress. I think this excuse very weak. Movable type printing is indispensable; that does not need arguing. Every trade and process is dependent on it. And the litho printer and apprentice is at a distinct disadvantage in having to fall back on his own resources to such a great extent.

The "Printing World."

Before going on to a brief review of a few printing journals which are rendering good service to the craft at the present day, there is just one other which I wish to refer to. That paper was recently discontinued, but close upon 20 years ago it was shedding a light which was luminous, for it was then a paper in the very front rank, although only established in 1893. I speak of the *Printing World*, a monthly, med. 4to, then edited and printed by Mr. Geo. W. Jones, London. Mr. Jones had for some time been amongst the most artistic printers in the country, he was one of a group of men who in the 80's lifted jobbing printing to a higher plane. He was the composing-room overseer at Messrs. Raithby and Lawrence's, Leicester, when the *British Printer* was established in 1888. The *Printing World* was, as a typographical production, when first issued, a long way ahead of anything in trade journalism previously seen from the British press, if we except the *British Printer*, but even the *British Printer* did not excel it at that time. The *Printing World* was full of good things, very fully illustrated; the half-tone process, which was already so largely superseding engraving, was utilised to the best advantage, and some very artistic specimen pages of jobs were given in each issue. Amongst other portraits and sketches of prominent printers of the day, in those early numbers, in one of the volumes on the table, you will find Mr. Thomas Glynn, of Manchester, and a specimen of his work. I believe I am right in saying that our friend and fellow-member, Mr. Charles Knowles, was with Mr. Glynn at that time. Another page half-tone engraving is of particular interest to the P. M. and O. A., being a portrait group of our First London Council. And, in the same number, is an article on the Association, which was then only about one year old. In that article appears the following paragraph:—"It is interesting and important to note that membership is not confined to London managers and overseers—one gentleman hails from Japan, and others are located in such diverse directions as Manchester, Portsmouth, Harrogate and Tunbridge Wells. Indeed, the Council specially recommend that the election of provincial members be warmly encouraged, with a view to the formation of auxiliary branches." I leave you to guess who was the Manchester member of the "diverse" group referred to.

"The British and Colonial."

In the last month of 1878, a new journal made its appearance in the printing trade. It was a royal 8vo., published fortnightly, and immediately "took on" the attention of live printers. The first number comprised 32 pp. and a cover. Its literary pages were well written, in a breezy style which arrested attention, it was printed on good paper, by one of the best firms of printers in London at that time. It announced that it would aim to be "attractive, brief, pungent, pointed; replete with pithy pars and good-natured humour." In a very short time this fortnightly often reached over 100 pages, and on December 1st, 1879, actually reached 216 pages. The value of a paper can often be gauged by its advertising connection, and the journal under review enjoyed the support of advertisers to a marked degree. Its founder and editor was Mr. W. John Stonhill, who had been on the staff of Messrs. J. M. Powell and Son, then proprietors of the *Printers' Register*. The paper's main title—for until quite recently it has borne various sub-titles—was the *British and Colonial Printer and Stationer*. To describe my own idea of the general appearance of the paper at the time it was started, I should call it Americanised-English. Mr. Stonhill had travelled in the States,* and I have not the least doubt that he modelled his new paper on the lines of some that he saw there. While not quite such an attraction to the working printer and apprentice as was the *Paper and Printing Trades Journal*, the *British and Colonial Printer* quickly asserted itself to be an equally valuable journal for the employer, its bi-monthly appearance giving it an advantage over all the other trade journals, none of which appeared oftener than monthly. By the courtesy of the present editor I am enabled to-night to exhibit a volume of some early numbers. A feature of interest therein is a series of articles on

"Printing and Stationery in the Provinces."

Turning to page 413, we find the printing offices and newspapers of Manchester under review. The article opens: "Manchester has been called the second city of the Empire." Very good; some of us think that it is the first in many things! But a statement a little lower down is not quite so near correct. We read that M. Taine had described our city as "dismal," and that among "other features" we had a workhouse "to accommodate 400,000 persons." If that were so, well might a city be dismal! Whoever M. Taine was, he had either a lively imagination, or more probably the misfortune to be misinterpreted. Speaking of the "Periodical Press," the article continues: "Manchester has fewer periodicals than Liverpool, but if fewer in number they are greater in influence." Then, in referring to jobbing offices, the writer says: "Every printer visiting Manchester must be struck with the excellence of the jobbing work produced there. Especially is this noticeable in the case of the placards which adorn the posting stations. Finer specimens are not turned out of any offices in the kingdom." Mr. Stonhill, I have reason to believe, wrote this series of articles himself, as he several times in other places made reference to his visits to the towns dealt with.†

Throughout those early numbers there appeared many good things, both interesting and educating. One might mention a series of papers on "Practical Art in Bookbinding." Then reviews under the head of "What Printers are Doing." There were also occasional contributions from that prolific but interesting and well-informed printing trade author, Mr. John Southward. Other well qualified writers helped to fill the pages of the *British and Colonial Printer and Stationer* with good useful matter, and oft-times a specimen of printing or other inset was given.

The paper was hardly two years old when, owing to its great success and bulky proportions, Mr. Stonhill decided to issue it weekly, and from 1881 down to the beginning of this present year it has appeared week after week

In the Large Folio Form,

which the members of the P. M. and O. A. have been accustomed to look for with special interest for so many years. It has continued to enjoy a remarkably wide advertising patronage, and some special export numbers have been big things. From time to time most valuable trade information has appeared in its pages, and, taken altogether the *British and Colonial Printer and Stationer* has been one of the great successes of our trade journalism. Personally, I confess to a preference to the fortnightly's in book form. Those were the days of youthful enthusiasm with me; I devoured *all* the trade literature that I could lay hands on. And I had ample opportunity. In addition to the journals already referred to, I had access to the *Printers' Register*, *Press News*, and *Printing Times and Lithographer*. As I have indicated, the *British and Colonial Printer and Stationer* continued to enjoy popularity as a weekly. It was the first paper in the trade—and I have heard of no other one since—to offer itself at a reduced subscription to employees. Mr. Stonhill conducted and edited the paper until 1896, in which year he took a Continental trip, returning home so seriously ill that from then he has been incapacitated from taking any part whatever in the conduct of the paper, his place in the editorial chair having been filled since 1896 by the present editor, Mr. Geo. Brown.

Before leaving our official organ, recognition should be made of the prominence which has been given to this Association in its pages, the ample space devoted to us, and the correctness of the reports which have appeared from time to time, and which have been of infinite value, in that they have kept the various Centres fully informed about each others doings from week to week.

Another Change.

This year has seen another change in the size of the *British and Colonial Printer and Stationer*, which is now a smaller and handier folio, and I feel sure that I shall be voicing the sentiments of all our members in wishing our official trade journal long continued usefulness and prosperity.

Mr. Shaw then spoke for a short time about our contemporaries, the *Printers' Register*, the *Caxton Magazine*, the *Modern Lithographer*, and also referred to a few House Journals. In closing he said: This, then, is the conclusion I come to. The service of our trade journals during the last 35 years has very largely been directed to encouraging printers to seek to attain to the highest ideals; to create with such materials as are available to each one of us *the best* that can be produced with them; to put soul into labour. To the apprentice, to the young journeyman, to the older journeyman, to the foreman, to the manager, to the employer—all of us journeymen, I would say: Support the trade journal; lay hold of all the trade journals you can; read them, study them; the poorest of them will teach you something. To everyone in our noble craft I say:—"Stick to your journal!"

DISCUSSION.

Mr. Thos. Kirkwood, the president, said he was delighted with the lecture, and thought Mr. Shaw must have spent a lot of time looking up events for the past thirty-five years. His remarks about the lithographers not supporting their trade journals was very true, and the only answer he might give was that each lithographer knew his business, and whenever someone offered to give them advice it was not worth accepting.

Mr. Edward McVay believed Mr. Shaw's lecture would instil into the members the necessity for supporting and studying the trade publications, and so far as the lithographic trade was concerned the workers were to blame for not having a good and instructive paper. He believed if a lithographic journal was produced, say by offset method, there would be greater support and more interest. Of course it would be a very costly publication, and should it not keep abreast of the times it would soon become a failure.

Mr. F. Burnett, vice-president, remarked that most of the magazines on the table were new to many of the members, and he would only touch on one or two with which he was

* Mr. Shaw is slightly wrong here. Mr. Stonhill was never in the States, but modelled his paper on an American trade journal that at that period was the best example of this class of periodical in that country.—[Ed.]

† The late Mr. John Southward was the writer of the articles referred to.—[Ed.]

most familiar. Each had its own special features, such as the *Printer's Register*, which was noted for its legal information. The best weekly trade journal was the *British and Colonial Printer and Stationer*, and to P.M. and O.A. members it was particularly interesting because each and all were able to see what others were doing in the letterpress and lithographic sections. The *British Printer* was the first publication amongst the monthly British journals, and the only faults he could find with it were that it contained too many pages of advertisements, and catered too much to the apprentice instead of the journeyman, who in a good many cases required educating. The number of advertisements might speak well for the publishers, but as a reader those were his views.

Mr. Richard Bates, ex-president, didn't think many of the members could have written so interesting a lecture, and it must have been a labour of love for Mr. Shaw to give his time collecting information. He well remembered the *Printing World* coming upon the market, and he subscribed to it for the greater part of its existence. It was a more practical journal than the *British Printer*, according to his thinking, although it might appeal differently to other people. It had been said many times that the *British Printer* was not practical enough, but he scarcely agreed with that view. It placed before the craft high ideals, and that had been its chief feature since its inception in 1888. He certainly agreed with the vice-president's remarks. If there was one thing deplorable about the trade publications it was the abominable advertisement display of many of them, and the fault could not be laid at the door of the compositor, because he had to follow the dictates of that self-assertive gentleman, the ad-writer expert. If some of those gentlemen would study the pages of the *British Printer* and try to copy them, there might be more attractive advertisements in other publications. He often wondered what was done with journals which were sent gratis to printing offices. Many never had the wrapper taken from them, but were dropped into the clerical waste paper basket, instead of being sent into the composing and press rooms, where the men would be thankful, as it was impossible for any person to subscribe at all. Of course, trade papers had to be read with a guarded mind, as it was not all gold that glittered, apart from the fact that they were out to do business. Speaking on the question of art in regard to the Specimen Exchange, he had looked through the early numbers and noticed the great change at the present day. Some of the borders in the early period would have taken a week for the compositor to set up, and the present modern display which was so effective, yet simple, was beginning to wane, and he saw the change gradually coming on. Art was subjective as well as objective, and he had been laughed at for his pains in stating that it was a fashion! What was to-day the very highest art, the apprentice in the future would look down upon with diffidence, as one person thought, a thing was beautiful whilst another did not like it. He had given up trying to reconcile ideas and art.

Mr. Thos. Rignall has listened to many a lecture, but never before had enjoyed one so much. When he looked around and saw the large number of publications it struck him very forcibly how versatile the letterpress men must be. If a little more practical lithography was put into the journals lithographers would be willing to give them support. He had always regretted that trade journals very seldom got beyond the counting house. The P.M. and O.A. and the men's unions might spend a little money in purchasing trade journals which could be perused at each head quarter. It was evident that the lithographic printers were lazy, and he would like to see more enthusiasm amongst them.

Mr. F. J. Hughes, hon. secretary, said he had only been 29 years amongst paper and print and could not go as far back as their worthy first president. Mr. Thos. Hailing, the father of modern printing, was born in Gloucester, in 1830, a town which has thirteen parish churches and a cathedral, hence the phrase "As true as God's in Gloucester." Mr. Hailing first issued his circular in November, 1877, and in March of that year he proposed to English printers at the Caxton Exhibition, the holding of a specimen exchange, the idea being obtained from Mr. Oscar H. Harpel, of Cincinnati. Mr. Geo. W. Jones was born at Upton-on-Severn, otherwise known as Sodom or Little Hell, as there could not be found ten righteous people in the hamlet. His father was a blacksmith, and he served until 20 years of age with Mr. Ebenezer Bayliss, of Worcester,

In AMERICA
There is published only one weekly paper representative of the interests of employing printers. It is the most popular Printers' Paper read, because:
It is the only strictly Business Paper.
The only Newspaper.
The only Paper which holds the attention of the man who owns the Plant.
The PRINTING TRADE NEWS does not attempt to teach printers to set type, but it is the foremost authority on the latest efficiency methods, the organization activities, progress in cost system work, approved methods of printers' advertising and anything and everything that tends to make the printing business a pleasant and profitable one.
We have good mechanics. Let us have good business men. Let the NEWS come to YOU every week. Europe $5.00 per year; Canada $3.00. 64 Pages weekly.

one of whose descendants is so popular with Birmingham members. Mr. Shaw had said Mr. Jones produced the *Printing World*. The founder was Mr. John Bassett, who only lived to see the first volume, and judging from the practical information it contained, there was every prospect of it outstripping the *British Printer*. Speaking of trade journals, in his apprenticeship days he always gave the palm to the *Effective Advertiser*, which contained a page of pithy practical paragraphs which, by a little thought, were put into everyday use. He had from the beginning been a subscriber to the *British Printer*, and the only complaint he had against it was, that it was like the Campbell's, "lang o' coming." He did not support Mr. Burnett in his remarks about too many advertisements, because if they were missing the contents and value of the paper to the printer would be deteriorated. It was proof that the journal was alive when it had such whole-hearted support from the supply houses. Why so many journals were not as progressive as they might be was on account of their inability to pay for information. If a journal paid its contributors it could command news from practical men who would sell their services, but did not feel inclined to waste time and money writing for honour. Last, but not least, was their own trade journal, the *British and Colonial Printer and Stationer*, which was progressive and up-to-date with information on trade matters. A good many supply houses thought it was a letterpress man's paper, but any person who regularly subscribed to it and perused its pages would say that it covered the whole trade. In its new form it was handy and for a matter of five shillings per year, the postman regularly delivered it at the subscriber's residence. Some years ago he suggested to the representative of a lithographic house that they should advertise in its pages, and the retort came, "What does a lithographic supply house want with letterpress printers?" He had since approached the same gentleman about his advertising experiment in the journal, and he had to admit his thankfulness for the suggestion as he had proved its worth. Technical students also eagerly scanned its pages weekly for the latest devices and information. He would like to see more use made of the correspondence columns as by those means wise men argued facts and the uninitiated gleaned knowledge. The *British and Colonial Printer and Stationer* was an excellently printed journal, and should be supported by every member. Mr. Rignall had suggested the purchase of journals for perusal on meeting nights and distribution amongst members. He might answer that by saying some eight years ago he tried the experiment, and some journals came back after being in the individual's hands three months and in other cases two years. At the present time he had a specimen exchange, some of which books had not yet been returned after an absence of eighteen months. The great drawback was the expense of postage from one to another and the lethargy of the present-day enthusiast (?). The best way was to secure the co-operation of workers to contribute a copper each week, then select the most useful journals for circulation. Where more than one office could combine the journals could be exchanged, thereby giving a wider range of periodicals. He had great pleasure in proposing a hearty vote of thanks to Mr. Shaw for his able paper.

Mr. FREDK. WHEELDON, in seconding, said there seemed to be a slight on the lithographer who did not have the resources of the letterpress members. Some time ago he read in a trade journal that during the American Civil War there was a regiment of lithographers and letterpress men, and during one of the marches they came to a sea of mud; the lithographers pushed on whilst the letterpress held back, and this gave him proof to show the resourcefulness of the lithographic worker who was always in front. Why a lithographic trade journal was not supported as it should be was because the lithographer was more taxed in mind and body than the letterpress man in his daily toil.

Mr. SHAW, in acknowledging the vote of thanks, said there was not much for discussion in his paper. He did not see why a paper should be looked down upon because it was not produced by lithographic process. In any case they would first have to resort to loose type, and he believed if lithographers would help the trade publisher he would be willing to give them every assistance to make his journal a success. He had never before heard a paper on trade journals, and perhaps the one that evening would cause them to come forward. He had refrained from giving a biographical sketch of different worthies, as his paper was meant to deal only with journals.

There was an excellent collection of journals and books of specimens from all quarters of the globe, and it did the eyes good to see the individuals eagerly perusing the contents of ancient and modern prints. Previous to the lecture the minutes of two previous meetings were read and passed.

WEE MACGREEGOR.

Subscribers desiring information as to the taking out of Patents are invited to write. Letters to be endorsed "PATENT DEPARTMENT," Office of the "British and Colonial Printer and Stationer," 58, Shoe-lane, London, E.C. Telegrams: Stonhill, Fleet, London.

Applications.

5,268 EELES, F. R. S., and WEST, B., machines for copying letters and other documents.

Tariff Changes

AND

CUSTOMS REGULATIONS.

From the "Board of Trade Journal."

CANADA.

It is announced that litho varnish and printing ink oil produced from linseed oil are dutiable at 15 per cent. *ad val.* if of British origin, or 17½ per cent, otherwise.

NEW ZEALAND.

The following relate to some recent decisions with regard to the application of the Customs Tariff:—

Articles.	No. of Tariff Heading.	Rates of Import Duty. On Foreign Goods.	Rates of Import Duty. On Goods the produce or manufacture of any part of the British Dominions.
Advertising novelties, articles for the manufacture of:—			
Cutters to cut discs of celluloid	359	Free.	Free.
Heating roller, a gas-heated cylinder for making celluloid pliable	359	Free.	Free.
Looking glasses, unframed, in small round and oval pieces	123	37½% ad val.	25 % ad val.
Stamped metal backs, being plain stampings	423	Free.	Free.
Stamped metal rings, japanned	186	37½% ad val.	25 % ad val.
Papers, filter shaped, for bacteriological work — claimed as scientific apparatus ...	74	30 % „	20 % „
Printing materials—			
Ball clips to hold printed sheets while drying	412	10 % „	Free.

FINLAND.

It is announced that "weight slips," made of paper labels, to be glued or otherwise stuck to pasteboard, are dutiable under No. 235 (5) of the Tariff, at the rate of 176 mks. 50 pen. per 100 kilos., or about £3 10s. per cwt.

COMMONWEALTH OF AUSTRALIA.

It has been decided that strawboards, lined with enammelled paper, are dutiable under No. 356 (P.) of the Tariff at the rate of 20 per cent. *ad val.* if of British origin, or 25 per cent. in other cases.

FRANCE.

Labelling machines and apparatus are dutiable as machine tools, according to class, under No. 525 of the Tariff.

The Truscott Pension Fund.

The Grand Hall of Cannon-street Hotel was crowded the other evening on the occasion of the inaugural concert to mark the establishment of the Truscott Pension Fund, in connection with the Printers' Pension Corporation. Sir George Wyatt Truscott, Bart., occupied the chair, supported by Messrs. H. D. Truscott, J.P., J. R. Truscott, and C. Truscott, while included in the audience were Messrs. C. W. Bowerman, M.P., C. J. Drummond, F.S.S., H. Wilson Howes, Jos. Mortimer (secretary, Printers' Pension), A. Bennett (general manager of Jas. Truscott and Son, Ltd.), and many other well-known gentlemen. The concert reached a high standard from both an artistic and a popular standpoint.

Sentimental ballads were finely rendered by Miss Alice Lilley (soprano), Miss Kate Rooney (contralto), Mr. David Smith (baritone), and Mr. Geo. Foxon (tenor). The last-named sang Gounod's recitative and aria, "Lend me your aid," with splendid power and expression. Miss Maud Niner's violin solos were beautifully played and enthusiastically received.

The humorous element was supplied by Miss Mollie Seymour with comic songs at the piano, Mr. Jock Walker and Mr. Will Edwards —the latter compensating for a late arrival by sending the audience home in merry mood. Mr. Alan Stainer succeeded in combining the somewhat rare qualities of ventriloquism and humour.

During the evening Sir George Truscott, in a short speech, announced that as a result of the concert, with its contingent subscriptions and donations, a sum of £255 would be placed to the account of the Truscott Pension. The Printers' Pension Corporation had been established no less than 80 years, during which time it had distributed some £200,000 and benefited 600 persons.

Mr. Geo. Robinson proposed a vote of thanks to the chairman, which was supported by Mr. Jos. Mortimer, who congratulated the gathering on the magnificent start they had made, and alluded gratefully to the great assistance which had been given to the cause of the aged printers by Sir George Truscott.

The chairman's health was received with musical honours, and Sir George Truscott replied in feeling terms.

A JOINT banquet of the Newspaper Proprietors' Association and provincial daily newspaper owners was held last week, at the Hotel Metropole, the Hon. H. Lawson, M.P., in the chair. The toast of the London Press was proposed by Mr. J. R. Scott, to which Mr. Lawson replied. "The Provincial Press" was proposed by Mr. E. T. Powell, and was acknowledged by Sir G. Toulmin, M.P., and Mr. R. H. H. Baird. Sir G. A. Riddell proposed "The Visitors," and Mr. J. S. R. Phillips submitted the toast of "The Chairman." A programme of music was contributed to by Miss Rose Baker, Miss Mary Law, Miss Lois Barker, Mr. Percy Tarling, and Mr. Milton Hoyes.

"INVESTORS FOUND."

How the "Evening News" Business Exchange INSURES SUCCESS.

The power of the *Evening News* lies in the immense number of persons whom it interests. Half a million people, and more, buy copies every day, and each copy is estimated to reach two or three persons at least.

That power is at your disposal. It has been used for years by readers wishing to find purchasers for any articles from motor cars to furniture, and of late it has been applied with equal efficiency to selling businesses for those who are retiring or who wish to expand elsewhere.

The *Evening News* can find purchasers for anything, but in the case of businesses for sale, a **specially perfected organisation** is placed at the disposal of those wishing to get into touch with investors. The services offered do not end with the insertion of an announcement in the Business Exchange Column which is a feature of that Journal.

To those who fill up the form printed below and send it, with 3s. for insertion, to the Business Exchange, 130, Fleet Street, E.C., the following additional advantages are offered.

WHAT THE BUSINESS EXCHANGE DOES.

(1) The essential facts contained in the form are drafted into an attractive business-like offer by our own expert staff. This appears in *The Evening News* "Business Exchange" List.
(2) It is reprinted in *The Evening News* House and Business Register, which is distributed without charge all over the country.
(3) The full facts are filed for reference by *The Evening News* Information Bureau, 130, Fleet Street, E.C., and are given to all inquirers who write (sending stamped and addressed envelope) or call for them.
(4) Secrecy is ensured by the employment of a "box number," to which all replies are addressed, "care of *The Evening News*." These are forwarded to the advertiser without charge.
(5) There is no necessity to pay any commission in order to secure a purchaser for the business.

"THE EVENING NEWS" BUSINESS EXCHANGE.

Nature of Business.	Trade weekly.	District and Situation,

Rent per annum.	Let off.	How long established.	How long in present hands.	Lease unexpired.
		—— years,		——years,

Any Sunday Trade?	Price for goodwill, fixtures and fittings.	If selling stock at approximate face value.	Reasons for selling.

Description of Premises, Living Accommodation, etc.	Register No. (for office use only).

Trade Notes.

THE death is announced of Mr. William Hale White, the author, better known as "Mark Rutherford."

WE regret to record the death of Mr. William John Fitzsimmons, for 34 years the editor of *Musical Opinion*.

MR. E. J. KIBBLEWHITE, the managing director of the Strand Newspaper Co., Ltd., has completed his 50 years' service on the staff of the journals controlled by the company.

BY a fire that broke out in Tokyo, last week, many firms of printers and publishers had their establishments destroyed. Altogether the fire caused damage to the extent of £1,500,000.

WE regret to record the death of Mr. Alexander Allan, proprietor and editor of the *Blairgowrie Advertiser*, and joint inventor of the Simplex folding machine, at the age of 68 years.

MALTA.—Tenders for stationery will be received at the offices of the Receiver-General and Director of Contracts, Valetta, Malta, up to April 3rd, 1913. Samples may be seen at the Pattern Room of the Crown Agents for the Colonies, Whitehall-gardens, S.W., where also full particulars may be had.

ADVANCE IN GLAZED CASINGS.—A meeting of makers of glazed casings of the Northern District of the Papermakers' Association, was held in Manchester, on March 4th, and it was decided that a further advance of 10s. per ton on present prices is necessary in consequence of the increased cost of materials, coal and manufacturing expenses generally.

ON Saturday evening a Bohemian concert was held at Anderton's Hotel, Fleet-street, to celebrate the completion of the endowment of a *Morning Post* bed in the Lloyd Memorial Seaside Home at Deal. Mr. H. A. Gwynne, the editor of the *Morning Post*, presided, and was supported by the Hon. L. J. Bathurst and the principals of the various departments of the newspaper. The chairman, in a brief speech towards the close of the evening, announced that the plate realised £75.

BUSINESS EXTENSION.—We understand that Messrs. Mitchell and Co., paper stock merchants, 5, 6, 7, Lower Jervis-lane, Dublin, are opening out in the wholesale and retail paper, paper bag and twine business, and have taken additional premises situated at 148, Upper Abbey-street, to cope with this increased trade. We feel sure that friends of Mr. Mitchell's father, the late Mr. John Mitchell, formerly of Higher Broughton, Manchester, will be glad to hear of the enterprise of his son, and wish him all the success he desires in his new venture.

ON Monday, in the King's Bench Division, a libel action brought by Sir John William Ramsden, of Byram, Ferrybridge, Yorkshire, against the *Daily News*, Ltd., was mentioned. Plaintiff's counsel said the libel was published in the *Daily News* on October 14th, 1912, in articles which purported to be written by a special correspondent, who went to the village of Brotherton. Counsel said from beginning to end the article consisted of a series of misrepresentations. Counsel for the *Daily News* apologised, and regretted the words complained of were ever published. Defendants would pay the costs. The record was withdrawn accordingly.

IN the Chancery Division, on Friday, on the motion of Mr. Galbraith on behalf of the plaintiff in the case of Coleman *v.* The Advertising World Publishing Co., Ltd., Mr. Justice Swinfen Eady appointed a receiver and manager of the defendant company. Counsel said the plaintiff was sole debenture holder in the company, which was incorporated in October, 1909. Defendants were proprietors and publishers of a newspaper, carried on under the name of the *Advertising World*. The company appeared by counsel and consented to the appointment and also to the usual judgment in a debenture holder's action. His Lordship limited the managership to three months.

After all Permink is the only genuine Pen Carbon Paper which gives Universal Satisfaction!!
All wise Stationers Stock it
THE DEBECEY W. & M. CO.,
22, COLEMAN STREET, LONDON, E.C.

THE death took place last week of Baron Stempel, the *Times* correspondent at Lisbon.

THE *Times* has signalised St. Patrick's Day by the issue of an Irish supplement of 32 pages dealing with life in Ireland.

ACCORDING to *Kemp's Mercantile Gazette* there were four failures in the printing and stationery trades of England and Wales for the week ending Friday, March 14th; the corresponding week in 1912 showed two.

THE death is announced from Washington of Tolbert Lanston, inventor of the Monotype. Several years ago he was stricken with paralysis and had been an invalid since. He was born at Troy, O., February 3rd, 1844, and lived in Ohio and Iowa until the Civil War, in which he served as a volunteer. In 1865 he was appointed clerk in the pension office at Washington and remained there for twenty-two years, during which time he studied law and was admitted to the bar at Washington. Early in life he turned his attention to invention and produced an adding machine, a mail lock, a hydraulic dumb-waiter, adjustable horse shoes and other patents. In 1885 he turned his thoughts towards a typesetting machine, and in 1887 took out his first patents. He was the first of modern inventors of typesetting machines to adopt the perforated paper system to control the mechanism of a type-making machine, and his invention inaugurated a new class of composing machines. In his first apparatus he proposed to make the type by compression, but in 1890 tne plan was changed to casting it instead. In 1896 Mr. Lanston was awarded the Cresson gold medal by the Franklin Institute of Philadelphia. He is survived by his widow and a son.

Farewell Concert to Mr. Alf. Wills.

Hon. Swimming Secretary to the P. and A. T. S. A.

Lovers of music had more than their fill at the Talbot Restaurant, the other evening, on the occasion of a concert given to Mr. A. G. Wills (who leaves for Canada in April), by his colleagues at the *Field* office, in recognition of his services as sports secretary and on the concert stage for the various trade charities. The chair was taken by Mr. G. Hopkins (assistant works manager to the *Field* office), supported by Messrs. H. H. Walker, H. F. Parker (hon. sec., Charity Sports Association), and R. P. Rose (*Field* office). The arrangements were ably carried out, and the musical programme left nothing to be desired.

Mr. Harry Winterflood's voice was heard to advantage in "The Iceberg" and "Jack Briton," while Messrs. Sweeny and Lynn (comedy duo) kept the audience convulsed by their quaint sayings, and their mandolin solos were much appreciated.

Mr. Fred Gilbert gave two excellent chorus songs. Miss Ada Norvall was as charming as ever in "Wouldn't you like to be the Bridegroom" and "Josh-u-a," and Miss Violet Arthur delighted the audience with Tosti's "Goodbye" and "The Promise of Life." Mention should also be made of the following artistes who contributed to a programme which would, had time permitted, have run into the early hours:—Messrs. Clark and Littlejohn (instrumental), W. Dyne (sentimental), Albert May (sentimental), Professor Regollo, James Bond (sentimental), Mr. Cis Judge (humorous), Master F. Holden, George Groves (sentimental), and George Swain (humorous). Madame Alys Sheed ably presided at the piano, and her selections were greatly appreciated by the company.

The Chairman, in thanking those present for the excellent attendance, and the artistes for their company, made reference to the objects of the concert; and in paying a high tribute to Mr. Wills, said: I have known Mr. Wills since a lad, and am proud to say he has always proved himself to be, in character and sportsmanship, a man in every sense of the word. No matter the distance or expense, provided the object was to do a fellow creature a good turn, one had only to ask Mr. Wills to ensure a ready response. From a technical point of view, I can safely say, as a master of his craft he has nothing to fear from anyone in a printing office, and the man who competes against him has got his work cut out to beat him; I look forward to his success in Canada. I take this opportunity of wishing him the best of luck and the success he merits in this, his newest venture.

Mr. R. P. Rose, in the course of some kindly remarks, said:—Although representing the accountants' department (and he was pleased to see so many of them represented), he was gratified to say Mr. Wills had earned the esteem of all from his part of the house. He had read various reports in the newspapers, wherein it was stated that a lot of the rough element was emigrating to Canada; but, he was sorry to say, in this case one of the best was going, and he trusted the ambitions of Mr. Wills would be fully realised. He hoped the *Field* office would be kept well informed of the progress made by him in Canada; also,

Mr. A. G. Wills.

that there were less remote things than his seeing Mr. Wills at some future time over there. Further, he would try his best to see that Mr. Wills would be presented with a suitable souvenir to take with him on his voyage, and he took this opportunity to wish him every happiness, luck and prosperity.

Mr. Arthur Williams (on behalf of the concert artisres of South London) paid a high tribute to Mr. Wills, and said they were all proud of the pleasure to assist at this farewell to their old friend.

Mr. H. F. Parker (hon. sec., Charity Sports) said he thoroughly endorsed the chairman's remarks. He had always found Mr. Wills a good fellow and a good sportsman. He was pleased to say that the swimming section of the sports had this year (under the presidency of Mr. Kennedy Jones) raised the sum of no less than £650 on behalf of the Bookbinders' Pension. As a secretary, Mr. Wills was well known in London, and he would take steps to see that he was equally well known in Canada, where he hoped a cordial welcome would be extended by all good sportsmen and workers in the interests of charity. He wished Mr. Wills the best of luck, and trusted at no distant date he would hear of his success.

Mr. Alf Wills, in reply, said he was proud to be the recipient of the kind remarks from the chair and his companions. He was proud of the friendships he had made at the *Field* office and in the athletic world. No matter in what part of the globe he might be he would always treasure the recollection of the appreciation and kind words meted out to him on the occasion of his departure.

The stewards were Messrs. J. L. Young, G. H. Welsh, H. C. Hopkins, F. Parish, C. Dohoo and G. Swain.

A song by Mr. Alf Wills, followed by Mr. George Swain, brought to a conclusion a pleasant evening, which will long be remembered by those fortunate enough to be present.

Machine Rulers, Bookbinders, Printers, and Kindred Trades Overseers' Association.

At the monthly meeting on Tuesday the 4th inst., Mr. E. A. Clifford, hon. solicitor to the Association, gave a very interesting and instructive address on "Employers' Liability" to a crowded and appreciative audience.

In introducing the subject the lecturer said he was afraid they would, as laymen, find it a somewhat dry one but he thought as overseers it was an important matter and one with which they should be conversant, not only from the point of view of the liabilities of the employer but also from the position they held as having the control of workers. Prior to 1837 the question of employers' liability found no place in the laws of this country at all. Then grew up under the common law a responsibility on the part of employers to their workpeople in respect of accidents arising owing to the negligence of employers. The doctrine laid down by the judges was that a master should take the same ordinary care of his workers as he would of himself, but while he was liable for an accident to a stranger visiting his works he was not responsible for the negligent act of one workman to another.

Digitized by Google

In 1877 a committee was appointed by the Government of that day to deal with the subject, but it never met and nothing was done until the Employers' Liability Act of 1880 was passed. That Act more clearly defined the master's responsibility for the accidents caused by his own default, and also provided a remedy in the case of a workman meeting with injury through his obedience to the commands of those having superintendence over him. Many of the anomalies of this Act were pointed out by the lecturer who gave some interesting examples.

The Employers' Liability Act whetted the appetites of trade unionists and others for more effective protection, and although it was a long time coming, continued agitation secured the passing of the Workmen's Compensation Act of 1897. While this Act brought about a vast improvement in the position of workers, it was very limited in its scope, and it ultimately gave place in 1906 to the Act which is in force to-day which provides practically complete immunity to all classes of manual workers in respect of accidents met with in the course of their employment, other than those caused by their own wilful misconduct.

The lecturer dealt with the machinery of the Act and the compensation payable under it, and pointed out the necessity of giving notice of any accident as soon as possible after its occurrence, to be followed, if necessary, by legal action within six months. He also stated that the Employers' Liability Act of 1880 was still in force and that it was quite optional on the part of the party injured, or, in the case of death, of his next of kin, to claim under either that Act or the Workmen's Compensation Act, according to whether the injury or death arose from a defect in machinery, the negligence of a superintendent, or from an entirely accidental cause. He showed how under the former Act the worker could secure a lump sum which might be more useful than an order for regular periodical payments where the injury rendered it improbable whether the man would be able to return to his trade.

The question of what is an accident was also discussed, and the lecturer showed that it must be attributable to some cause other than natural happenings. For instance, lead poisoning, say to a printer, would not come under the Act because that is a risk common to the employment into which the operative enters with his eyes open.

The lecturer also dealt exhaustively with the much vexed question of whether the accident arises in the course of the employment, and he gave many decisions of the courts which were not only particularly interesting to a body of men outside the legal profession, but were in some cases very amusing. They showed the fairness of the judges in administering the Act, and in some instances demonstrated how anxious judges are to give the workman a favourable judgment.

The necessity of employers and overseers doing all in their power to lessen the risk of accident, by having proper printed instructions placed over machinery, and all dangerous parts covered up, was also dwelt upon.

At the conclusion of the lecture the hearty and continued applause showed the manner in which an interesting rendering of such a technical legal subject was appreciated.

In the discussion which ensued, Mr. F. C. Peacock dwelt upon the effect of the Acts upon friendly societies, the increasing percentage of claims upon the insurance companies and the consequent heavy increase in the premium paid by the employer, but thought notwithstanding that the Act had been of immense benefit to the workers generally.

Mr. C. Atkins said his opinion of the legal profession had been vastly improved that evening, and he should go from the meeting looking upon the lawyers with a more favourable eye than he had ever done before.

Mr. J. Walker (vice-president), Mr. F. Pearce, and several other members having taken part in the discussion, and a host of questions having been asked and tersely answered, a vote of thanks to Mr. Clifford for his attendance and his instructive and interesting lecture was carried with acclamation, and brought a very successful meeting to a close.

Tenders Accepted.—For printing for the Bermondsey Borough Council: F. Tarrant and Co., Ltd., Camberwell-road, S.E.; for stationery: S. T. Green, Aldersgate-street, E.C. For supply of books to the Islington Borough Council: T. Miles and Co., Upper-street, Islington; for periodicals, W. H. Smith and Son, Strand, W.C. For a supply of stationery to the Corporation of Stafford: Messrs. A. H. Smith and Son, and Messrs. Halden and Haywood. For printing and stationery for the Oswestry Town Council, Mr. W. Hope.

The Private Christmas Cards Association.

The eleventh annual meeting of the Association of Publishers of Private Christmas Greeting Cards was held at Armfield's Hotel, Finsbury, E.C.

The President (Mr. G. Delgado), recorded another satisfactory year, all the previous year's publishing and wholesale members having joined, together with one additional wholesaler. He stated that the greatest loyalty had been displayed by all the important retail stationers throughout the country, and the trade reports from all quarters appeared to be eminently satisfactory, the last season having proved a record one. He added that the Council continued to exercise great care in the acceptance of retail members, and refused everyone who could not show a proper connection with the stationery trade.

The following officers and council were elected for the year 1913:—

President, Mr. Joseph Birn (Birn Bros.). Vice-President, Mr. G. H. Stockman (Dorendorff and Co.) Hon. Treasurer, Mr. Arthur Ferriman (Meissner and Buch).

Members of the Council.—Sir Adolph Tuck, Bart. (Raphael Tuck and Sons, Ltd.); Messrs. Stuart Bruce (Alexander Baird and Son), G. Delgado (G. Delgado, Ltd.), C. W. Faulkner (C. W. Faulkner and Co., Ltd.), Andrew Lyon (Lyon, Ltd.), Wm. McKenzie (W. McKenzie and Co.), Wm. Ritchie (Wm. Ritchie and Sons, Ltd.), W. W. Russell (W. W. Russell and Co.); E. W. Savory (E. W. Savory, Ltd.); John Walker (John Walker and Co., Ltd.); Harper Woodhead (Harper Woodhead and Co.).

Auditors.—Messrs. Hibberd, Bull and Co.

Solicitors and Secretary.—Messrs. Elkin and Henriques.

Later in the day Mr. Delgado was the recipient of a very graceful attention on the part of the Council on his retirement from the office of President, which he had held for the past three years. Mr. J. Birn, on behalf of the Council, presented him with a very beautiful rose bowl with the following inscription:—

Presented to G. Delgado, Esq., President 1910 to 1913, of the Association of Publishers of Private Christmas Greeting Cards, by the Members of the Council, as a token of the appreciation of his services as President, and the deep interest he has taken in furthering the objects of the Association:—Joseph Birn (President), G. H. Stockman (Vice-President), Stuart Bruce, C. W. Faulkner, A. Ferriman, W. McKenzie, M. Misch, E. W. Savory, H. S. Sharpe, Adolph Tuck, John Walker, W. Ritchie, R. Q. Henriques (Secretary).

By the new Merchandise Marks Bill, which is to be introduced by Mr. Staveley-Hill, M.P., the wording "Made in Germany" is to be abolished. In the case of goods not of British manufacture, the words "Not British" will be used, and "British-Empire made" will be the mark on goods manufactured in any part of the British Empire outside the British Islands.

Special Prepaid Advertisements.

IT IS IMPORTANT that Advertisements under any of the Headings mentioned below should reach us by the first post on Wednesday to insure insertion the following day.

SITUATIONS.—Charges for Advertisements under the headings "Situations Vacant," or "Situations Wanted," are at the rate of

ONE SHILLING FOR 24 WORDS

(3 Insertions: TWO SHILLINGS),

and Fourpence for each additional Eight Words. Minimum Charge, One Shilling.

BUSINESSES FOR SALE or WANTED, MACHINERY WANTED or FOR SALE, SALES BY AUCTION, TENDERS, PUBLIC APPOINTMENTS, MISCELLANEOUS—One Penny per Word.

STONHILL & GILLIS, 58, Shoe Lane, London, E.C.

Situations Wanted.

AN ACCOUNTANT'S CLERK (experienced), with spare time, would be glad to undertake the supervision of a firm's Books of Account and to prepare Balance Sheet and Profit and Loss Account and Income-Tax Returns.—Address, "B. T.," c o J. W. Vickers and Co., Ltd., 5, Nicholas-lane, E.C. 13179

LITHOGRAPHY.—WORKING FOREMAN requires change; well up in all branches of the trade, Colour and Commercial, Transferring and Machine; can send references and specimens.—Address, No. 13164, Office of the British and Colonial Printer and Stationer, 58, Shoe-lane, London, E.C. 13164

Machinery and Plant for Sale.

ALBION and COLUMBIAN PRESSES, second-hand, Foolscap Folio to Super Royal; Galley Proof Presses, 28-in. and 16-in., in thorough good order; cheap; call and inspect.—W. J. Connoll and Co., Ltd., 5, Maclean's-buildings, New-street-square, E.C. 13175

ALL ELECTROTYPERS and STEREOTYPERS should write H. Williams and Co. for their latest catalogue of machinery, and Electroline Enamel Paste, for producing fine art stereos.—Engineers, Red Lion Works, Warner-street, Rosebery-avenue, E.C. 12343

CASES, uppers and lowers, S.H., all at 1s. each, cash with order, carriage forward.—W. J. Connoll and Co., Ltd., 5, Maclean's-buildings, New-street-square, E.C. 13171

CHASES, largest stock of Wrought and Cast, second-hand, all sizes, cheap.—W. J. Connoll and Co., Ltd., 5, Maclean's-buildings, New-street-square, E.C. 13177

CROSSLEY GAS ENGINE, 4-5-i.h.p.; can be seen at work in Plymouth.—Write, H. 26, Western Morning News, Plymouth. 13162

CROWN FOLIO CROPPER, thoroughly overhauled, cheap for immediate sale. Crown Folio Peerless Platen for power, good order, £15.—W. J. Connoll and Co., Ltd., 5, Maclean's-buildings, New-street-square, E.C. 13169

CUTTING MACHINES, 42-in. Furnival, 30-in. Ullmer, 32-in. Horne, 36-in. Millboard Cutter, all in good condition and cheap for cash.—W. J. Connoll and Co., Ltd., 5, Maclean's-buildings, New-street-square, E.C. 13176

DOUBLE CROWN WHARFEDALE, geared inking, double rolling motion, wind-up flyers, double gearing, splendid condition, been thoroughly overhauled, £75 cash.—W. J. Connoll and Co., Ltd., 5, Maclean's-buildings, New-street-square, E.C. 13172

DOUBLE DEMY DAWSON, wind-up flyers, in good condition, £55 for immediate sale.—W. J. Connoll and Co., Ltd., 5, Maclean's-buildings, New-street-square, E.C. 13173

GOLD BLOCKING PRESSES, 14-in. by 10-in. hand, 16-in. by 12-in. power, both in good order and cheap for cash.—W. J. Connoll and Co., Ltd., 5, Maclean's-buildings, New-street-square, E.C. 13170

QUAD CROWN BREMNER WHARFEDALE for Sale, cheap; can be seen running at Plymouth.—Write, H. 27, Western Morning News, Plymouth. 13163

QUAD ROYAL, by Payne, balanced flyers, geared inking, slitter, in thorough good order, cheap to save double removal.—W. J. Connoll and Co., Ltd., 5, Maclean's-buildings, New-street-square E.C. 13174

TYPE.—Call and inspect our stock of practically new Type at second-hand prices; some never been inked.—W. J. Connoll and Co., Ltd., 5, Maclean's-buildings, New-street-square, E.C. 13178

Miscellaneous.

BOGNOR (in centre of town opposite Banks, G.P.O., Arcade, etc.).—Twelve Shops now being erected and almost completed. Seven already let to Draper (2 shops), Boot Maker, Hosier, Irish Linen House, Ladies' Outfitter, and Dealers in Bacon and Ham. Good opening for high-class STATIONER. Rent, £80-£100.—Apply, Henry R. G. S. Smallman, F.S.I., A.R.I.B.A., Architect, 8, Queen-street, Cheapside, London, E.C. 13168

LINOTYPE COMPOSITION.—Advertiser desires to communicate with the Proprietor of a newspaper in an English South Coast Town who will entertain a proposition to install a Linotype Machine in or near his premises. Advertiser would propose to furnish say from 25 to 35 columns of news matter weekly at a price agreed upon, not in excess of hand composition rate. Such proprietor would have no responsibility in regard to machine, motor, metal, power, etc.—Enquiries to H. W., "The British Printer," Thanet House, 231, Strand, W.C. 13180

Property To Let.

CLERKENWELL.—Warehouses and General Business or Manufacturing Premises to Let. Modern construction and well lighted. Very moderate Rentals.

13 and 15, Little Sutton Street. Floor space about 28,000 sq. ft., would be divided.

11, Little Sutton Street. Floors to Let in this building.

17, Little Sutton Street. Convenient corner premises. Floor space about 3,800 sq. ft.

Apply to Caretaker on the premises, or to Mr. T. W. Blackmore, Old Serjeant's Inn, Chancery-lane, W.C. 13898

You have an unusual opportunity to reach the Office Equipment Dealer, Retail Stationer, and Purchasing Agent—through ONE medium—the

Inland Stationer

The BUSINESS EQUIPMENT JOURNAL.

An examination of the magazine itself shows you why.

The Office Equipment Dealer and the Retail Stationer subscribe to it because it handles the selling end of their lines in a business-like manner. Every issue contains articles of sales plans of real practical value.

The Purchasing Agent subscribes to it because it keeps him in close touch at all times with the latest and best developments in business equipment.

You can reach all three with ONE advertisement and at ONE price by using ONLY *INLAND STATIONER*—BUSINESS EQUIPMENT. Let us send you some important facts.

The Customer Dictates.

APROPOS of the remarks in a recent issue as to the injustice done to the printer by the customer furnishing his own paper, we quote the following from our contemporary, the *American Printer*:—"There was a time in the printing business, and not so long ago at that, when the paper dealers were asked by printers not to sell direct to publishers or else to give printers a preferential discount on their purchases. There still exists a feeling among proprietors of some printing establishments that they are entitled to a profit on the sale of the paper which they use, and the disposition is to demand that the paper dealers help them to get it. The Denver master printers recently put themselves on record as demanding a preferential discount, and the Colorado Editorial Association, composed of owners of printing offices throughout the State, endorsed the demand at a meeting held soon after. This attitude cannot be said to prevail universally in the printing trade, however, and is not very seriously considered by paper dealers as a class, and probably never will be, for some paper dealers sell more largely to publishers without plants than they do to the printers themselves. A new phase of the purchasing situation has presented itself. Recently one of the largest buyers of printing in New York accompanied a request for bids on the printing of its catalogue by the statement that the ink to be used would have to cost a certain price and be bought from specified houses. As the worth of the ink required amounted to about ten thousand dollars, it was considered to be a matter important enough to come before the New York Typothetæ, which passed a resolution containing the statement that its members would decline to furnish estimates for printing wherein the specifications demand, that the printer shall pay a certain designated price for ink, and that the ink shall come only from a named manufacturer, or that the forms shall be sent to a designated electrotyper. Every printer knows that there are inks and papers that cannot be made to work together satisfactorily, and it was a knowledge of the danger that lies in responsibility for quality impossible to produce under such restrictions that caused some employing printers approached to decline to make any estimates whatever. The ink houses involved found themselves in disfavour with printers who were familiar with the situation, and in some cases their salesmen were told that their visits would no longer be productive of orders. As it is doubtful that a large amount of sales of ink could ever be made to those who buy printing, it is expected that the ink manufacturers will adopt the printers' point of view.

* * *

"A Healthy Baby."

THE convention of the American Paper and Pulp Association, that was held last month in New York, has not passed over without providing plenty of food for reflection for the printer. The report of the coated paper division—which was prefaced by the words, "This is not a swan song, but a few cold facts . . ."—stated that the prices of nearly all raw materials were advancing, and that the offset process of printing has caused many printers and lithographers to install this type of press, and substitute plain for coated papers. This manner of printing is still in its infancy, but rather a healthy baby. In the coated board division report a recommendation was inserted to adopt a universal cost system. "The Printers and Folding Box Manufacturers' Associations have taken up the cost proposition and the results in those Associations have been extremely satisfactory," adds the report. The news should be of great interest to those who attended the recent cost congress in London, and it may be taken for granted that the uniform cost system must be a great success in America when a keen and observant body like the Paper and Pulp Association recommends its adoption.

* * *

An American View of Newspapers.

AT the convention of papermakers held last month in New York, Judge Charles F. Moore had something to say about newspapers and womanhood. The analogy is only known to himself, because he is a "possumist," which is an average between an optimist and a pessimist. "Do right," he said, "and you must pay to get your name in print; do wrong and you must pay to keep it out. The man who in an unguarded moment goes astray gets a column; a man who does right gets no notice at all. The woman who makes vulgar display of her great wealth and lavishes her affections on poodles and pugs and Pomeranians gets her picture on the front page of the coloured supplement of the Sunday edition, while the thousands of good mothers and wives who are labouring to accomplish something on behalf of the world and the nation, scarcely gets a line." It should be explained that the assembly to which these words were addressed complain that their businesses are suffering from the persistent attacks of certain interests whose influence is potent at the seat of American government—"a government by the publishers for the publishers." Judge Moore is an out-and-out paper man on the manufacturing side, and hence his wrath on attacking the publishers of periodicals and newspapers.

DISSOLUTION OF JOINT STOCK COMPANIES.—A notice appears in the *London Gazette* for the 11th inst. to the effect that the following companies have, as on that date, been struck off the Register of Joint Stock Companies, and thereby dissolved:—

British Printing and Advertising Co., Ltd.
Invisible Advertising Card Syndicate, Ltd.
Liberal Press, Ltd.
London Advertising Co. and Rowland Press, Ltd.
London and General Printing Co., Ltd.
Marksman Publishing Co., Ltd.
"Our Local" Printing and Publishing Co., Ltd.
Picture Press, Ltd.
Rapid Printing Machinery Co., Ltd.

NEW COMPANIES.

STEEL BROTHERS (CARLISLE), LTD.—Registered, on March 13th, with a capital of £6,500, in £1 shares (6,000 preference), to take over the business carried on at Carlisle as "Steel Bros.," including the copyrights of the *Carlisle Journal*, the *Carlisle Evening Journal*, and the *Carlisle Express and Examiner*, and to adopt an agreement with J. Steel (executor of the late Jane C. Steel). Purchase consideration, £3,500 (£3,000 cash and £500 shares); £1,000 of this is for goodwill. The subscribers are: Sir Robert A. Allison, Kt., Scaleby Hall, Cumberland; F. W. Chance, Morton, Carlisle; Sir Benjamin Scott, Bt., London House, Stanwix, Carlisle; J. Steel, 60, English-street, Carlisle; R. D. Denman, M.P., 35, Campden-hill-road, W.; Sir Wilfrid Lawson, Bt., Isel Hall, Cockermouth, Cumberland; and J. Morton, Home Acres, Carlisle. Minimum cash subscription, 25 per cent. of any of the shares offered to the public. The first directors (to number not less than three nor more than six) are Sir Robert A. Allison, Kt., J. Steel (managing director and editor), J. Morton, F. N. Hepworth and J. E. Plender. Qualification, £100. Remuneration of J. Steel as fixed by agreement; of others as determined by the company. Solicitor, T. S. Strong, Carlisle. Registered by Jordan and Sons, Ltd., 116-117, Chancery-lane, W.C.

"TOURISME," LTD.—Registered, on March 13th, with a capital of £6,000, in £1 shares (2,000 preference), to carry on the business of printers, publishers, lithographers, electrotypers, engravers, stationers, etc., and to adopt an agreement with L. Alwyn. Minimum cash subscription, 7 shares. The first directors are L. Alwyn, R. T. Pelly, and J. M. Lickfold. Qualification, £10. Registered office, 13, Old Cavendish-street, W.

NORWICH GRAPHIC, LTD.—This company was registered on March 7th with a capital of £1,500, in £1 shares, to carry on the business of newspaper proprietors and publishers, printers, etc. The subscribers are:—H. Nixon, Bank Chambers, Norwich, publisher, 1,000 shares; E. E. J. English, 9, Thorpe Dene, Thorpe-road, Norwich, secretary, 50 shares. Private company. H. Nixon, of North Walsham, is the first secretary. Remuneration as fixed by the company. Registered by H. Nixon, Bank Chambers, Norwich.

GRIFFITHS AND MILLINGTON'S BILLPOSTING DEPARTMENT, LTD.—Registered on March 13th with a capital of £10,000, in £1 shares, to carry on the business indicated by the title. Registered office, 167, Bromsgrove-street, Birmingham.

SOUTHEND TILBURY AND GRAYS BILLPOSTING COMPANY, LTD.—Registered on March 13th with a capital of £4,000, in £1 shares (3,000 preference), to carry on the business indicated by the title. Registered office, 11, Clarence-street, Southend-on-Sea.

BOROUGH ADVERTISING COMPANY (PORTSMOUTH), LTD.—This company was registered on March 11th with a capital of £2,000, in £1 shares, to carry on the business of billposters, newspaper and general advertising agents, and contractors, etc. Private company. Registered by Jordan and Sons, Ltd., 116-17, Chancery-lane, W.C.

An Example

of the many letters received every week from enthusiastic Linotype users.

Increased Work.

Speed in all Changes.

Standing Matter.

Avoids Overtime.

Anticipates Another Machine.

The Purchase Justified.

I am very pleased to say that since the installation of Linotype Model 4 Triplex Machine, the work has increased to such an extent that, without its many strong advantages, it could not have been undertaken. As it is, with the simplicity and quickness of change of body and measure, not to speak of the advantages of the Automatic Quadder, I have easily overcome the extra pressure. When I take into account that a large amount of the work at present in hand will have to stand for some time, and that this will be free from "pi," and not require any of the men picking various letters therefrom, it adds considerably to the value of the matter set. In fact, I don't know how I have done without the machine so long; but for it I would have been working overtime for weeks, whereas I have had no overtime at all. These facts give me every hope that, with the continuance of the present orders, I may ere long be compelled to consider the advisability of again placing an order with you for a machine similar to this with different body founts.

I should like to add that in every respect your points of recommendation in persuading me to purchase the machine have been fulfilled to the letter, whilst the courtesy and attention all through the transaction and afterwards have been most marked.

This is the experience of thousands of Linotype users. Linotype advantages are available to *every* Printer who permits himself to have them.

Financial.

Offices of the *British and Colonial Printer and Stationer*,

58, SHOE LANE, LONDON, E.C.

WEDNESDAY, March 19th, 1913.

DURING the past week the money market has fluctuated between plenty and scarcity, and the demand has varied likewise. On Saturday the market finished with a plentiful supply of credit and a weaker demand, but on Monday the demand was strong again, and funds being short, borrowers were compelled to go to the Bank of England for a small amount. Discounts have latterly shown a weaker tendency, in spite of the firmness of money rates and a demand for gold on the part of Germany. Stock markets have been sluggish, with prices inclined to droop, and Consols are a shade easier.

The miscellaneous industrial market has remained quiet and dull this week, and no revival is likely until after the holidays. Movements in prices have been small, and in the section relating to paper and print there has not been a movement either way of importance. Business has been done in Amalgamated Press Pref. at 21s. 3d.; in Associated Newspapers Pref. at 21s.; in Cassell and Co. at 5 and 97s. 6d. xd.; in International Linotype at 78½; in Kelly's Directories Pref. at 10; in *Lady's Pictorial* and *Sporting and Dramatic* Publishing Pref. at 57s. 6d.; in Spicer Bros. Pref. at 91⅞; in *Standard Newspapers* Pref. at 55s. and 52s. 6d.; in Raphael Tuck and Sons Ord. at 18s., 17s., and 17s. 3d.; in Waterlow and Sons Ord at 26 and 26½; in Waterlow Brothers and Layton Pref. at 7⅜; and in Weldons Ord. at 32s. 9d. and 31s. 6d., and in the Pref. at acc. 19s. 6d.

DIVIDENDS AND REPORTS.

W. B. FORDHAM AND SONS.—Dividend of 6 per cent. per annum for the half year, making 5 per cent. for the year. The same has been paid for nine years.

JOHNS SON AND WATTS.—The directors of Johns Son and Watts, Ltd., announce a dividend of 5 per cent. and a bonus of 6d. per share, free of income-tax, on the ordinary shares for the past year, placing £1,000 to reserve and carrying £7,836 forward.

VALENTINE AND SONS.—The directors' report states that the trading profit was £10,271, and after payment of the preference dividend to December, 1912, there remained with the previous balance £6,701. The directors have set aside to depreciation fund £2,500, bringing it up to £10,000, leaving £4,201. They propose to pay a dividend of 3 per cent. on the ordinary shares, absorbing £1,627, and to carry £2,000 to a fund for the equalisation of dividends, leaving £574 to be carried forward.

THOMAS OWEN AND CO., LTD.—The report of Thomas Owen and Co., Ltd., for 1912 states that the gross profit for the year amounts to £34,730. After adding thereto £396 brought forward and making deductions for interest, depreciation, etc., there remains a net available balance of £15,880. The directors recommend that this should be appropriated as follows:—Dividend at 6 per cent. on the preference shares, £12,000; addition to general reserve fund (making that fund £33,000), £3,000; carry forward, £880. The operations at Hjerpen have now been completed, and the directors are hopeful that in future the profits of the company will be augmented from that source.

COMPANY MORTGAGES AND CHARGES.

Fresh Obligations registered pursuant to Section 10 of the Companies Act, 1907, and Satisfaction registered pursuant to Section 16 of the Companies Act, 1900. (The registration of Satisfaction is not compulsory.)

FERRESTONE PRESS, LTD.—Mortgage and land registry charge, both dated March 3rd, 1913, to secure £400, charged on land and premises at Knights-hill, West Norwood. Holder—G. H. Summers, 3, Lampton-road, Hounslow.

SPICER BROTHERS, LTD.—Trust deed dated February 17th, 1913 (supplemental to trust deed dated September 9th, 1890, securing £150,000, of which only £130,000 has been issued), charged on 1-3, Tudor-street, and two assurance policies. Trustees—A. Spicer, J.P., 19, New-bridge-street, E.C., and W. Newburn, Hawkwell-place, Pembury, Kent.

A WORD OF CAUTION.

In giving the official Gazette information, it must be distinctly understood that we take official records as we find them, and accept no responsibility for inaccuracies, while, as an almost invariable rule, the facts will be found correct. We advise our readers, before forming hasty judgment, to consider that there may be in each case a satisfactory explanation which does not appear on the records.—Ed.]

ENGLAND AND WALES.

PARTNERSHIPS DISSOLVED.

MORAN, G. T., and J. B., and BROWN, A. M., trading as Moran and Brown, 26, Villiers-street, Sunderland, printers, bookbinders and stationers. Debts by G. T. and J. B. Moran, who will in future carry on the business at the same address under the style of E. Moran and Sons. February 28th.

THE BANKRUPTCY ACTS, 1883 AND 1890.

RECEIVING ORDER.

ALLEN, E. B. A., and M. J., trading as Davis and Allen, at 91, Chertsey-road and Duke-street, Woking, stationers and printers. Date of order, March 10th, made on the debtor's own petition. First meeting of creditors, March 28th, 11.30 a.m., at Bankruptcy-buildings, Carey-street, London, W.C. Public examination of debtor May 6th, 11.30 a.m., at the Guildhall, Guildford, Surrey.

ADJUDICATION.

HAKE, W. H., lately trading as the South Coast Emporiums Co., at 23, Sea-road, Boscombe, Hants, stationer. Date of order, March 10th.

NOTICES OF DIVIDENDS.

POPP, J. I., Desborough-road and Frogmore, High Wycombe, Bucks, newsagent, etc. First dividend of 2s 6d., August 17th, at High Wycombe.

PECHHAM, A. E., 202, Above Bar, Southampton, newsagent. First and final dividend of 6¾d., March 20th, at the Official Receiver's Office, Midland Bank-chambers, High-street, Southampton.

APPLICATIONS FOR DEBTORS' DISCHARGE.

CHARLEY, F. H., lately of 31, Hilldrop-crescent, Holloway, London, N., journalist. To be heard April 9th, 11 a.m., at Bankruptcy-buildings, Carey-street, W.C.

BLOOMFIELD, W., 50a, Victoria-street, Great Grimsby, publisher and printer. To be heard April 16th, 10.30 a.m., at the Town Hall, Great Grimsby.

NOTICES OF RELEASE OF TRUSTEES.

MARTIN, F. R., trading as Westerton's Library, 43 Knightsbridge, London, W., stationer and librarian. Trustee, F. G. C. Dixon, accountant, 17-21, Tavistock-street, Covent-garden, W.C. Released March 6th.

DYSON, A. J., 17-19, William-street, Slough, Bucks, stationer and newsagent. Trustee, C. Mercer, official receiver, 14, Bedford-row, W.C. Released January 16th.

QUADS.

[We do not necessarily identify ourselves with any opinions of our contributor. At the same time, readers will not need to be assured that he always endeavours to communicate something worthy of attention.]

"I hold every man a debtor to his profession, from the which, as men do of course seek to receive countenance and profit, so ought they of duty to endeavour themselves by way of amends to be a help and an ornament thereunto."
FRANCIS BACON, Baron Verulam.

Tolbert Lanston, the inventor of the Monotype, has worked upon the last of his inventions. He died at Washington the other day. He had nearly reached to what we call the allotted span. One would have thought, however, to judge only from his portraiture, that a lease might have been taken of his life for another ten or fifteen years. His face was that of the strong man: strong physically and in all the word's connotations; a distinguished, handsome face; the sort of face that evokes an instant wish for closer acquaintance.

o o o

Alas, that it should be too late.

o o o

He was born at Troy, O., February 3rd, 1844, and lived in Ohio and Iowa until the Civil War, in which he served as a volunteer. In 1865 he was appointed clerk in the Pension Office at Washington, and remained there for twenty-two years, during which time he studied law, and was admitted to the Bar at Washington.

o o o

The American Printer records that early in life he turned his attention to inventions, and produced an adding machine, a mail lock, a hydraulic dumb waiter, adjustable horse shoes and other patents.

o o o

In 1885 he turned his thoughts toward a typesetting machine, and in 1887 took out his first patents.

o o o

The journal I have quoted thinks he was the first of modern inventors of typesetting machines to adapt the perforated tape system to control the mechanism of a typemaking machine, and that his invention inaugurated a new class of composing machines.

o o o

I am not quite sure as to this. Eight years ago I compiled a short history of the earlier attempts at composing machines. It was published in Sell's annual Press Directory, and I think, remains the most complete record of mechanical typesetting inventions yet compiled. Alas, I have lent it. I have an impression that someone had hit on the idea of the perforated tape, but that this was not followed up.

o o o

In his first apparatus he proposed to make the type by compression, but in 1890 the plan was changed to casting instead. In 1897 the Lanston Monotype was perfected. In 1896 Mr. Lanston was awarded the Cresson gold medal by the Franklin Institute of Philadelphia.

o o o

Several years ago Mr. Lanston was stricken with paralysis. He remained an invalid from that sad date.

FRANK COLEBROOK.

LORD CURZON, OF KEDLESTONE, is to preside at the annual dinner of the Royal Literary Fund, on Tuesday, May 27th.

Labour Newspapers, Ltd.

The report to December 31st last states that, in submitting their first annual report, the directors are fully conscious how bold a venture was the publication of a daily paper, in the successful establishment of which great risk must necessarily be taken, involving the expenditure of a large amount of capital. It was this knowledge that induced the directors to fix the nominal capital of Labour Newspapers, Ltd., as high as £150,000; but, unfortunately, in consequence of the depleted conditions of the funds of many trade unions at the time of issue, the shares applied for to the date of this report amounted to only £85,000, and this limited amount of capital has been a source of embarrassment throughout. The welcome to the *Daily Citizen* was highly satisfactory and encouraging in many districts, but, speaking generally, it must be said it was somewhat disappointing. With over 2,000,000 trade unionists, Socialists and other sympathisers, the directors felt they could confidently look for a minimum sale of 250,000 copies per day. It must, however, be frankly stated that even this number would have been a comparatively small proportion of the movement, and yet this figure has not always been reached. The most seriously disappointing feature has been the failure to secure anything like that proportion of advertisements which was confidently hoped for, and which, for a paper covering the entire country, the directors were led to expect. In spite of the less encouraging features the directors feel that the shareholders will agree that the *Daily Citizen* has fully justified its title to the front rank as a daily newspaper, that as a fighting weapon of the working-class movement it has proved itself to be indispensable, and that its educational value for propagating the principles of the movement stand unrivalled. In order to overcome the difficulties already referred to, especially the lack of advertising revenue, and to place the position frankly before the movement, the matter was brought to the notice of the Parliamentary Committee of the Trade Union Congress and the National Labour Party Executive.

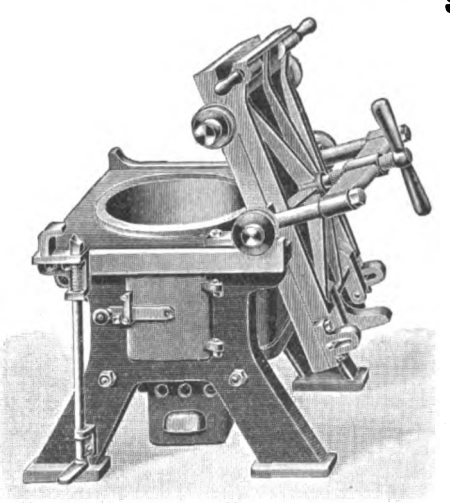
Stationery Exports.

The following are the exports of stationery, other than paper, from the United Kingdom for the month of February, compared with the corresponding month of the two previous years:—

	1911.	1912.	1913.
To Germany ...	£7,245	£8,934	£10,431
„ France... ...	4,657	4,640	3,820
„ United States of America ..	4,867	3,155	5,345
„ British India...	12,861	15,257	15,446
„ Straits Settlements ...	3,120	3,123	5,071
„ Ceylon ...	1,541	1,505	1,369
„ Australia ...	10,755	14,321	12,673
„ New Zealand	5,099	5,228	4,715
„ Canada ...	4,772	3,934	3,180
„ Other Countries... ...	55,790	62,839	64,304
	110,707	122,986	126,404

For the two months, January and February, the total exports reached £277,919, an increase of £16,484 over the same period of 1912, and an increase of £36,726 over the corresponding two months of 1911.

Exports of Printed Books.



The following were the exports of printed books from the United Kingdom during February, compared with other previous periods:—

	February		Jan.-Feb.	
	cwts.	£	cwts.	£
1913	23,607	168,708	64,138	377,606
1912	27,055	155,256	59,964	354,642
1911	27,384	163,730	58,593	341,729

FOR the supply of stationery, books, etc., for three years for the Bristol Corporation the tender of Messrs. Jefferies, Sons and Co. is recommended for acceptance.

BOOKBINDING SECTION.

Bookbinding Notes and News.

It will be noticed that we have altered the form of our monthly summary of happenings in the bookbinding industry. This has been done in order to comply with a request of the Postal authorities. It appears that the attention of the Postmaster-General has lately been directed to numerous infringements of the rules relating to the inclusion of supplements in registered newspapers, and, in consequence, enquiry into the whole subject is now proceeding. Pending a formal decision with regard to future procedure on the point, the authorities at the General Post Office have suggested the adoption of certain modifications by newspaper proprietors generally. Therefore for the present, at any rate, the bookbinding section of our journal will not retain its previous form of a separate removable supplement, although in other respects unchanged.

The Calendar for 1913 issued by the well-known firm of Messrs. Smyth-Horne, Ltd., of 19, Cursitor-street, E.C., was made to serve a dual purpose. The calendar for the year is printed at the foot of a large card, while the upper portion is devoted to illustrations of the Smyth book-sewing machines and to actual samples of suitable threads and tapes, which are neatly attached to the card, with particulars as to sizes and prices. The threads and tapes are specially manufactured for Messrs. Smyth-Horne by the firm of Messrs. J. and P. Coats. Eight samples of cotton threads of various thicknesses are given, all being of first quality, uniform in thickness, ends laid on, not knotted, elastic, and of guaranteed lengths. The seven samples of tapes vary in width from $\frac{7}{16}$ to $\frac{5}{8}$ inch, and are of the following kinds; grey stiff tape, white glazed tape, "A" tape, linen frame tape, grey twill tape, and grey stiff web. The Smyth machines are capable of being worked with linen thread and two samples of such threads are given. The popularity of the Smyth book-sewing machines is indicated by the fact that over 3,000 are in use, and that one British wholesale bookbinder has installed over a hundred of them. We understand that Messrs. Smyth-Horne, Ltd., will be pleased to send one of these calendars to anyone in the trade who makes application to them.

Her Majesty the Queen recently consented to receive a copy of the works of Francis Thompson, a Preston poet, but instead of the specially bound one which it was intended by the publisher to present, a "plainly bound" copy is to be forwarded, in accordance with Her Majesty's expressed wish. Commenting on this fact, the *Birmingham Daily Mail* hopes that this choice will be followed as an example by many other people all over the country. "Elaborate and costly bindings have a beauty of their own, of course, but one must protest against the practice of putting them on any sort of book. The fine binding is only fitted to the fine book, and there are few books so beautifully produced nowadays that they deserve costly covering. In any case, readers who want to use their books will agree with Queen Mary that the first consideration about a binding should be usefulness."

As the result of a memorial presented some months since by the National Union of Bookbinders and Machine Rulers, an advance of 2s. per week in wages has lately been conceded to the operative bookbinders at Belfast.

The Brighton Public Library is one of several in this country which possess their own bindery. In the report for the year ending November 16th, 1912, particulars are given of the work accomplished during the year. "The cost of the Library Bindery during the year was £165 for wages, and £31 2s. 4d. for materials, a total of £196 2s. 4d. The value of the work done, according to the prices in our last binding contract, was £204 10s. 6d., showing a saving of £8 8s. 2d. 634 books were rebound; 309 re-sewn and repaired; 493 were rebacked, recovered and recased; and 3,483 were numbered and lettered. 39 new magazine cases were made, and 15 repaired; the staff of the Bindery also spent 3,057 hours in mending books and maps, mounting newspaper cuttings, etc. In addition, work to the value of £89 13s. was done by outside binders, due, to a large extent, to the number of replacements made in the Fiction Department, many of which were unbound when purchased."

Mr. W. H. Beers, of 40, St. John-street, E.C., who has supplied the bookbinding and printing trades with reliable materials for many years, has favoured us with a pattern book of new book cloths known by the name of "Vinco," for which he has just taken up the sole agency for the United Kingdom, British India, Canada, South Africa, Australia, New Zealand and the British Possessions generally. There is a wide range of "Vinco" cloths in various grades, designs and shades, which are designated by such names as "Newton cloth," "Art Vellums," "Hibernia cloth," "Sail cloth," "Modern Linen," "Satins," "Moleskins," "Corduroys," "Hollands," "Library Morocco," "Library buckram," etc. There are cloths galore for all classes of bookbinding, many of which are unique as regards shade and design, while all are attractive. The Corduroy Moleskin quality will appeal to the makers of loose ledgers, whilst the "Linen buckrams" the "Library Morocco" and the "Library buckrams" should attract the binders who specialise in library work. The Art vellums and fancy cloths are suitable for publishers' book-work and would make attractive covers, while box-makers will find amongst these cloths as many tasteful designs as they require. A post card sent to Mr. Beers will secure such samples of "Vinco" cloth as the enquirer desires.

Amongst the contracts placed by H. M. Stationery Office during January were the following:—Binding 74,950 "Field Service Regulations, Part II., etc," M. Bell and Co., Temple Works, Cursitor-street, E.C.; mounting about 20,500 Ordnance Survey Maps, 42in. by 29 in., J. Halden and Co., Ltd., Rowsley Works, Reddish, near Stockport; printing, binding, etc., 1,500 Postmen's Attendance Books, 4,000 Army Book 153, supplying 3,700 Spring Portfolios S. 567, 4,300 covers for Army Book 155, 1,000 Loose-leaf Binders, Waterlow and Sons, Ltd., Finsbury, E.C.

The tender for bookbinding during the next twelve months of Messrs. G. Smith and Son, Station-road, Forest Gate, E., has been recommended for acceptance by the Islington Borough Council.

Mr. W. Newbury, of the East Ham Binding Works, has secured the contract for executing the bookbinding work required by the West Ham Corporation during the next twelve months.

The tender of Mr. G. F. Banting, Danesmere-street, Putney, for the binding and rebinding of books for the Greenwich Borough Council, was recommended for acceptance, as was also that of Messrs. F. Tarrant and Co., Ltd., 108, Camberwell-road, S.E., for executing bookbinding work at 22½ per cent. below standard prices, for a term of three years.

Employment in the bookbinding trades during January showed a decline as compared with the previous month, though some overtime was still worked. The percentage of unemployed amongst the 3,459 trade unionists thus rose from 3·1 (in December) to 4·0, which is, however, much better than the 5·4 recorded in December, 1911. In all other parts of the Kingdom—except Edinburgh and Dublin, where it was slack—work continued good, so that the percentage of unemployed, out of a total of 3,074, was only 2·1, against 2·6 in December and 2·7 in January, 1912. On the whole there was a pretty general improvement.

The imports of book cloth during February amounted to 37,700 square yards, value £981, as compared with 24,024 square yards, value £590, in the same month of last year, and 38,311 square yards, value £925, in February, 1911.

According to a recent issue of the *Standard*, a novel, "The Bony Hand," of no exceptional literary worth, was lately the subject of a trial in Berlin to establish its real value, because it possessed a binding of human skin. The sale-room value was £8 15s. This statement inspired a representative of the *Star* to make some enquiries on the subject generally, and he found that in London trade is sometimes done in such bindings. About £25 was obtained for a copy of Holbein's "Dance of Death" thus bound, which, had it been simply encased in morocco, would only have realised 25s. An expert who gave evidence in the Berlin case only knew of six similarly-bound works in Germany, but the *Star* man discovered that an order was recently placed with a London firm for such a book by a gentleman who is now in a lunatic asylum. The order was not executed. Human skin has the same biscuit-like colour as pig skin, the only difference between the two being that the former has a grain of four angles and the latter three. Human skin has no special beauty, and the texture is not stronger than a score of other materials. Its value is in the trouble necessary to obtain it. "If I wanted human skin I could get hold of it easily," a well-known London bookbinder stated, "and I could sell books bound in it. Half of them, I dare say the whole lot of them, would go to America. Collectors are a rum class, and they simply jump at anything gruesome."

The Teddington Public Library Committee has decided to purchase shilling editions of novels and send them to their own binder, so as to obtain a stronger binding and clearer print than is obtainable in six-shilling editions.

Referring to an exhibition of students' work at the Birmingham Art Gallery last month, a writer in the *Star* remarked that: "Bookbinding, of which some beautiful examples are exhibited, offers little scope locally for commercial purposes, as people of means and taste in Birmingham seem to prefer to go to London to have their volumes specially bound, in spite of the excellent talent which exists in their own city."

A few examples of bookbinding also figured in a similar exhibition at the Sheffield University a short time back. They were executed by students of the Technical School of Art, and the character of the work shown was such as to reflect great credit on the teacher of the bookbinding class there, Mr. Walter Slinn. Some of the books shown were bound in brown morocco, very effectively decorated with designs in black and gold.

In connection with the appeal to non-union bookbinders to join the National Union of Bookbinders and Machine Rulers (referred to in our last Bookbinding Number), the London Joint Committee of that organisation issued the following manifesto:—

> **To account bookbinders on every class of binding, gold blockers and finishers, paper and book edge marblers, pocket-book workers, binders' cutters, machine rulers, gilders, and to workers generally in the bookbinding industry:**
>
> **Fellow Workers,—The reduction in working hours to 50 per week is now a recognised fact. We invite you to share the advantage. The 50-hour working week is now recognised by the Government, and all national, local and public bodies.**
>
> **It is a distinct advantage to every weekly wage-earner—except piece-workers, and they must have justice, too.**
>
> **What about your piece-work prices?**
>
> **The above Union has prepared a scale of prices which just meets the increase that piece-workers should be obtaining equivalent to the time worker. It provides for every kind of account bookbinding, from one-section covered work to Russia banders, and the binder can tell at a glance just what work he has to do for a given price, by consulting the column for each process.**
>
> **Additional improvements for time workers, such as payment for overtime, rate for temporary employment, and other advantages, have been established, as printed in local rules.**
>
> **Superannuation, unemployment, benevolent and other benefits. Immediate protective benefit. Reduced entrance fees. Never mind what class of work you are employed upon, get inside your Trade Union at once.**

It is also pointed out that except for the very recent reduction of hours to 50 per week, the account book section of the bookbinding trade has stood at a standstill for the last twenty years, receiving only 34s. for 52½ hours, and in some cases 54, per week, whereas the letterpress bookbinders have been working a 48-hour week and receiving more wages for many years.

Employment in the German bookbinding trade was somewhat slacker in December, so that the percentage of unemployed, amongst 33,336 trade unionists, rose from 2·0 (in November) to 2·9, against 2·8 in December, 1911.

The percentage of unemployed, amongst bookbinding trade unionists in Norway, was only 0·8 in December, out of a total of 486. In December, 1911, it was 0·5.

Digitized by Google

We regret to record the death, on February 6th, at Indianopolis, of Mr. Robt. Glockling, President of the International Brotherhood of Bookbinders, the leading organisation of the United States and Canada in connection with the industry. Mr. Glockling was born in 1854 in London, and began working at the early age of nine years. He was employed at various occupations until he finally was indentured as an apprentice to the bookbinding trade. His parents went to Canada while he was still a lad, so that his first trade union card was issued by the Knights of Labour in Toronto in 1871, and he carried a paid-up card ever since. He became Master Workman of the local assembly and was a delegate to the district assembly for many years, in fact until the Brotherhood was formed. He attended its conventions as delegate and officer in 1898, 1900, 1902, 1904, 1906, 1908, 1910, 1912; was elected President in 1905, upon the resignation of Brother Tatum, and served continuously until the end. He held the position of Secretary of the Bureau of Labour of the Province of Ontario, which he resigned in 1906 to accept the permanent position of President of the International Brotherhood of Bookbinders. In all the conventions he was very active in the campaign for the eight-hour day, which he carried through in 1907. The funeral took place in Toronto on February 10th, and was very largely attended by friends and fellow-members, 200 of whom marched two abreast in advance of the hearse.

At a recent meeting of the Washington (U.S.A.) Branch of the International Brotherhood of Bookbinders, an address was delivered by a retired dentist, Dr. D. McFarlan, who, although long out of the trade, is still a member of the Branch, and has acted as its treasurer for over forty years. He displayed with pride a watch presented to him fifty years ago (1863) by the Journeymen Bookbinders' Society of Washington.

In the course of a speech delivered recently before the Ways and Means (Tariff Revision) Committee of the American House of Representatives at Washington, Mr. Thos. Carroll, of the New York Allied Printing Trades Council, said that a single firm in his city had lately given an English house an order for a million-and-a-quarter books to be bound in cloth. The feeling amongst operative binders in the United States with regard to such matters is well illustrated by the following extract from a series of resolutions passed lately by the Philadelphia Branch of the International Brotherhood of Bookbinders:—

> **"Resolved, That this Branch recommends an increase on the present tariff on Bibles and religious books. Also all books bound in foreign countries, printed sheets flat or folded, books partly bound, covers for books, either leather, cloth or any material used in binding books, or cases or book covers for books, with or without any labour upon the same, pieces of leather or any other materials, stamped or printed for books or book cases, should have sufficient duties added to equalise the difference between American and foreign paid labour."**

The Report for the year ending June 30th, 1912, of the Library of Congress, Washington, U.S.A., states that 30,601 volumes were bound during the year, as against 31,580 for the preceding year. As acid-free leathers have been in extensive use in this country for several years, thanks to the work of the Royal Society of Arts, it is rather surprising to read in the Report of the Librarian of Congress "that only recently have certain leathers appeared in the market guaranteed free from mineral acids and of sound tannage. These leathers the Government Printing Office is trying to secure for us." Regarding the total of leather bindings for the year, the Report states that 6,043 bindings were morocco and 8,985 cowhide. The Report goes on to state that "As the term 'morocco' is used in the market, and as formerly understood in this Library, all of these bindings might be made 'half morocco' at no greater cost than this divided binding now amounts to. The cost of the 'morocco,' so-called, used by us formerly was about $13 a dozen skins. The grade we now use costs $48 a dozen (*i.e.*, about 16s. 8d. a skin). Although nearly all of the Library binding was formerly known as 'half morocco,' probably no true goatskin of any merit could then be found in the entire output of the bindery. By using cowhide or some similar leather for the miscellaneous ordinary bindings the difference in the appearance of the leathers informs us by mere inspection just what we are using, whether a true goatskin of high grade or a substitute leather." The binding of library books in leather that has not been tanned and dyed in accordance with the recommendations of the Royal Society of Arts is very deplorable, and we trust that ere long acid-free leathers will be as easily obtainable in the States as they are in this country.

The February number of the *Bulletin* issued by the New York Public Library also contains a reference to acid-free leathers. It states that "The process of manufacture of this leather is still in the experimental stage, and so far only three successful colours have been produced." The *Bulletin* has some interesting information regarding the bindery established in the New York Public Library. "The bindery began operations on January 2nd, 1912, with a force of eight people, consisting of a foreman, one finisher, two forwarders, three sewers and one boy. It was increased to 22 people on April 1st, when the bindery took over all the reference and central circulation binding. Owing to the heavy increase in the current work the force was further increased to 34 people in December, consisting of the foreman, four finishers, six forwarders, twelve sewers, six collators, three apprentices, and two boys." The results of a year's work was as follows:—Books bound, 8,368; books rebound, 8,492; repairs, 804; miscellaneous, 8,835; library publications sewed, covered, etc., 17,600; giving a total of 44,099 books.

A gross total of 74,891 volumes, including 892 periodicals, were rebound for the New York Library during 1912, a decrease of 2,833 as compared with the number rebound in 1911. The ratio of volumes rebound to volumes circulated during the year was about 1·6 to 100. The average prices per volume paid for rebinding during the last three years were $.498 in 1910, $.495 in 1911, and $.462 in 1912, the average price for the entire period being $.485 per volume, or about 2s. These figures include prices paid for special bindings used for atlases, dictionaries, encyclopædias, and other reference works.

The Proudfit Loose Leaf Co., of Grand Rapids, Mich., U.S.A., is demonstrating the advantages of the Proudfit binder, as to which they say: "It is going to revolutionise loose-leaf book-keeping. It does away with the bothersome and unsightly posts of the old-time loose-leaf: only one inch, instead of three, is required as a binding margin; expansion is increased, it is lighter and fully as strong as any binder, and it has the appearance of the time-honoured spring-back, flat-opening blank book."

The costliest volume in the retail book department of E. P. Dutton and Co., New York, is a copy of Whistler's "The Gentle Art of Making Enemies." In the jewelled binding are 24 topazes, 18 moonstones, 13 garnets, 6 olivines, 4 turquoises, 1 amethyst and 1 ruby. It occupies the place of honour in the rare book-room—a dazzling contrast to the hundreds of dead and forgotten books that lie scattered in the dark and dusty corners of the book-store vaults.

The Chambers Bros. Co., of Philadelphia, a well-known American firm of folding machine makers, has lately introduced a quadruple folder, a new machine with the inserting feature. It will deliver four separate sixteens or will insert and deliver two thirty-twos. On insert work the insert signatures are placed in position before the third fold is made and are perfectly headed up. One-half of the machine can also be used for insert work while by the other half two sixteens are delivered separately and simultaneously.

A POSTER IN TROUSERS.—The general public in Egham High-street, the other day, says the *Daily News*, witnessed a novel development in the art of the poster—a classical statue represented in check trousers. On the hoarding the public saw the well-known "Junora" poster, in which Canova's statue and a boxer symbolises the physical energy imparted by the wine of health, but the lower limbs were encased in trousers of an aggressive pattern, and the words, "By order of the Council," were conspicuously displayed.

American Practice in Stationery

BINDING.

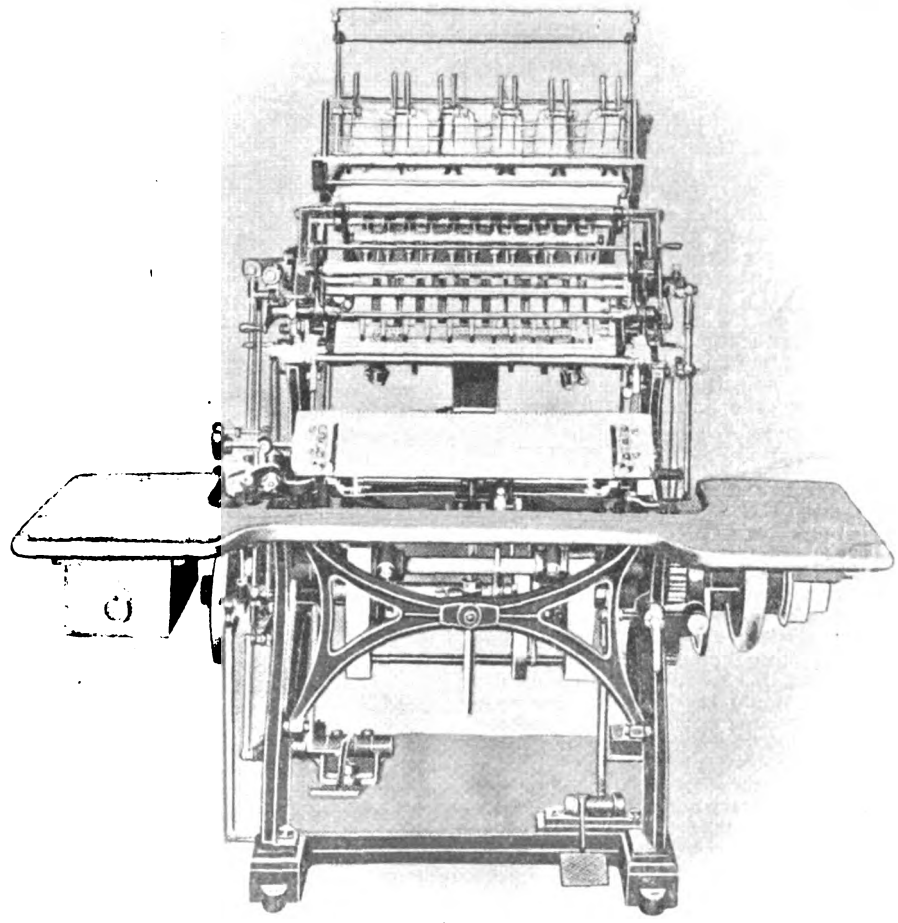
The following interesting article by Mr. Sam Rice, in the *International Bookbinder*, should furnish many useful hints to those who often have the job of binding a big account book. It is written in the racy style characteristic of the American operative who writes for his Trade Union periodical.

A 1,500-page double medium blankbook is about as big a book as the average bookbinder usually gets to bind. Of course there are much bigger blankbooks, but the average bookbinder hardly ever sees them. It requires considerable skill and experience to make a good and neat binding out of a big book like this. I often get an order to bind a 1,500-page double medium blankbook. Style of binding, three-quarter, canvas sides. It is always a flat opening first-class book.

After the ruler and printer is through with the job, the girl looks over the sheets, folds them into sections,and sews the sections on the stubs (*i.e.*, guards). And here I wish to say that I believe in the continuous stub. I do not like, and I emphatically condemn, the use of the single stub, which has to be whip-stitched. A book which is sewed on a continuous stub always opens flat, while a book which is sewed on a single whip-stitched stub very often opens like a printed book. And it takes about thrice as much time to sew a book on single stubs than it takes on a continuous stub. Also, a book sewed on single stubs is very hard to round, and when rounded, does not keep its rounding very long, while a book which is sewed on a continuous stub is easy to round, and it keeps its rounding a long time. So much about the stubs. After the girl has sewed the sections on the stubs, the bookbinder has to hammer the book down, and saw it out for the tapes. Four strong, one-inch wide, first-class blankbook tapes, are enough. An easy way to saw out this big book is, to put the book with the straight back between two pieces of binders' board on the table. Have the book with boards stick out about one inch from the edge of the table, put some heavy weight on the book, and saw it out in a kneeling position. It is not necessary to glue the stubs together. I do not believe in it. Just sew it good and strong, and that is enough. The main thing in a book is, that it should be well sewed, with good, strong, waxed thread, the sections as well as the stubs. Good heavy marble paper endsheets, with green or red art canvas joints, are necessary on every first-class book. I always strip my endpapers on the inside, where the first and the last stub can be seen, with white muslin. I don't like to leave it unstripped, because the glue easily runs in, and so it does not look nice.

I always trim my blankbooks on three sides, before glueing or rounding them. I see no reason why so many bookbinders are so anxious to trim a book in the "round." It takes about thrice as much time to trim a book in the round as it takes to trim it on all three sides first. And the edges will be just as smooth. In a good many shops all the blankbooks have to be round cornered. Not only the boards, but the book itself. And it is impossible to round-corner a book unless you trim it first on all three sides. I know some bookbinders who are just crazy to trim a book in the "round," and they consider it a horrid crime if some other more enterprising bookbinder trims his books on three sides first, before glueing or rounding them. I trim a 1,000 or a 1,500 page double medium book on three sides without blinking.

After trimming my book on all three-sides, I have to round corner it. After round cornering a big book it is best to green edge it, as it would be an awful job to marble it. A nice solid green edge looks good enough on any first-class blankbook. Of course, a smaller book with marble edges looks pretty. I green edge my book on all three sides, glue it, and round it nicely, and make the flabs or flaps. A big book must have strong flaps. I always put a piece of pressboard about three inches wide, and a half an inch shorter than the book is, under the tapes.



It is very important to have about three or four stubs of the continuous stub enter into the making of the flaps, as this tends greatly to increase the strength of the book. When the flaps are made, sheets of tin are placed underneath them, strips of paper on the outside, the book is placed between two smooth wooden boards, and put into the big press. Close the press good and tight, and leave the book in as long as possible—twenty-four hours is not too much. Care should be taken that the back of the book shall be damp when it is put into the press. After the book is taken out of the press it has to be strapped. And now I want to say something about strapping. I believe that it is not necessary to strap a book with a stub back with leather. A flat opening book can be strapped with a piece of good canvas. It takes about a skin of flesher to strap a 1,500-page double medium book, but only one foot of canvas. A small skin of flesher costs about 75 cents (3s.), but a foot of the strongest canvas costs only about 7 cents. It does not make the book any weaker if it is strapped with canvas, and they open very nicely. Use thin canvas for thin books, and heavy canvas for heavy books. I strap my flat opening books with canvas in this way: I glue the canvas and the back of the book. I draw the canvas over the back, and then I put plenty of thin paste on it, and rub it in good and hard with the palm of my hand. Let it dry for about two hours This makes a wonderfully strong strapping. It beats flesher strapping all to pieces. The canvas can never get loose on the back. But I also believe that a plain sewed blankbook should be strapped with strips of flesher. For boards, on a 1,500-page double medium book, I use three number 20, and one number 35 board, for one side of course. On a big book I always put on my spring back with heavy canvas before I put on my sideboards. I use number 15 Davey board for the back. I cut it about three-quarters of an inch longer than the length of the book, and fully one inch wider than the width of the back. A gigantic book has an enormous spread, and it requires an ample back. If the back is too narrow the book cannot be closed when it is once opened. I always make it a point to open and close a few times every blankbook I make (after I have the spring back on) to see how it works. I soak the back in hot water for a few minutes, mould it carefully, line it out with heavy ledger paper, as this makes it strong and stiff. Before I put the back on the book I line it on the inside with comb marble paper, so that when the book is opened, and the inside of the spring back is plainly visible, instead of seeing a dirty paper lining, you see a nice clean piece of marble paper. This should also be done on all very good blankbooks. And only after I have the spring back put on the book with good strong canvas I cut the boards and put them on the book. Good large squares are necessary. Hubs (*i.e.*, raised bands) on the back of the volume, are the next thing. They should be fully one inch wide, and should consist of seven layers of number 50 strawboards. They have to be put on so that they will stick good. Then, of course, the book has to be put into canvas and leather, but it is needless for me to describe that, as every bookbinder, or at least, blankbook binder, knows how that has to be done. When the book is rubbed up it will look very neat. I also always stuff the heads with soft paste-soaked rope, as this makes a nice, large and solid head. Good material is absolutely necessary to make a good job, as even the best bookbinder cannot turn out a good book if he has to use inferior material or bad tools or bad machinery.

When the book is dry enough it should be pasted up, put into the big press, and left in there as long as possible. At least until the finisher wants it.

Some Patent Methods of Sewing.

By GEO. A. STEPHEN

(Joint Author of "Manual of Library Bookbinding.")

One of the most important factors which determine the physical life of books is the quality of the paper, and, unfortunately, the durability of books within the last decade or so has been disastrously affected by the general use of inferior qualities of paper. Publishers are generally more concerned with low prices than with the quality and serviceability of books, and, consequently,

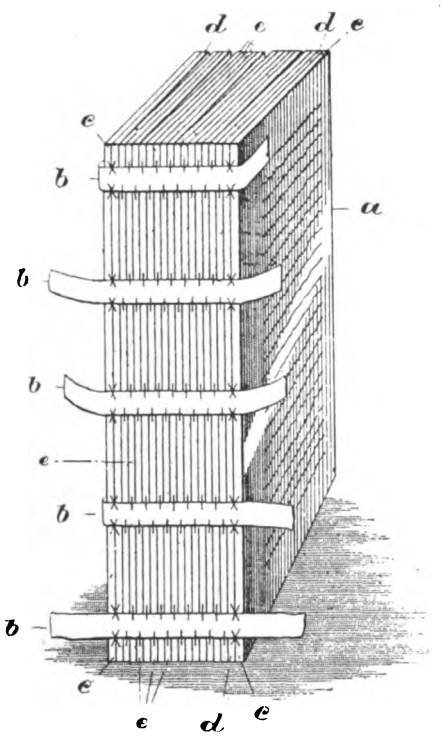

Fig. A.

featherweight paper is largely used for their books, to the regret of binders, who cannot sew such paper satisfactorily by the ordinary methods of sewing.

Necessity being the mother of invention, several binders who make a speciality of binding for public libraries have invented special methods of sewing, with the object of overcoming the difficulties which beset binders when sewing books printed on paper of poor quality. The firm of B. Riley and Co., of Huddersfield, has patented a method of sewing, the object of which is to reduce the tension put upon the paper by the thread, and thus prevent the tearing of the leaves at the folds. By this invention the kettle stitches at the head and tail of the book are dispensed with, and tapes substituted. The stitches pass through these tapes, and also through the usual intermediate tapes, instead of employing the usual method of sewing over the tapes. It is thus claimed that any strain or tension is borne by the tapes instead of by the paper, and the different sections which comprise the book are secured together over the whole surface of their back edges instead of only at the top and bottom. The first two and last two sections are sewn "two sheets on all through," so that the tapes of these end sections are stitched down on both sides. Fig. A is a reproduction of the illustration accompanying the specification, which thus describes the method: "This drawing represents the body of a book *a* without covers, in which five tapes *b* are employed, though the number of such tapes will, of course, vary according to circumstances. As will be seen, each of the outer sections, *c*, *c*, is attached to the next section *d*, as well as to the tapes, by twenty stitches, whilst each inner section *e* is secured to each of the five tapes by one stitch, the stitches in this case crossing the edges of the tapes alternately as shown. Each section *e* is thus secured at five places to the tapes and through each tape to the adjacent sections on each side."

For public library books the ordinary method of oversewing is objectionable, because the books are then very inflexible, and the paper soon tears after constant handling by the borrowers. The books are prepared for the ordinary method of oversewing by having the sections trimmed at the back in order to convert the book into a pile of single leaves. The back edges are then roughened with the side edge of a saw, and the back is glued up. When the glue is dry the book is separated into thin sections, each of which is overcast or oversewn, by passing the needle through and through the side of the section, bringing the needle over after each stitch. From the third section onwards, the two preceding sections are generally sewn through each time a fresh section is sewn; thus each section contains three times as many stitches as were inserted during the sewing of one section. During the past twenty years the firm of A. O. Heyner and Co., of London, has adopted a method of oversewing which effectively meets the requirements of cheap books that need to be oversewn. By Heyner's method the sewing is partly done by a machine that stitches small quantities of the single leaves which have been made up into sections in the usual way, prior to overcasting. The sections, after being provided on either side with a strip of linen to prevent the paper from being torn, are stitched through the side by a machine, nearly one-quarter of an inch from the back. The sections are then sewn on to tapes in the ordinary way.

Mr. G. F. Ayling, of the Bedford Bindery, has patented a method of sewing which in some respects resembles Heyner's method. According to the specification, the *modus operandi* is as follows. After the back folds have been cut off by a guillotine the back edges are glued, and, when dry, saw cuts are made for the purpose of the usual kettle stitches. "After this the book is divided into a number of sections, 6, 8, 10 or 12 sheets, depending on the thickness and quality of the paper, and in rotation each section is machine-stitched along the back edge, about one-sixteenth of an inch therefrom, by a lock stitch of about half-an-inch in length. Such mode of stitching creates a straight and true new fold for its respective sectional leaves, and such leaves do not easily yield to tearing. The stitching is then rolled into the paper or the like. The numerous sections thus formed are then in readiness for any of the subsequent methods of sewing them together."

Fig 1

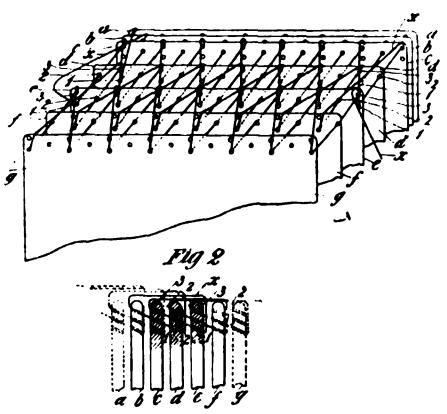

Fig 2

Fig. B.

Mr Cedric Chivers, of Bath, who has effected a number of patents for improved methods of binding, has patented a method of overcasting which is a decided improvement over the ordinary one. In his book entitled "The Paper and Binding of Recent Lending Library Books," published in 1909, he states that a few years ago he tested the paper of some five thousand books, and, as a result, "an average difference in strength was discovered between the machine way of the paper and the cross direction of no less than 45 per cent." He also discovered that, "With 3,717 English books 66 per cent. of the papers showed the grain to be across the page, that is, in the strong way for binding. Thirty-four per cent. of the papers exhibited the grain up and down the page, making the book weak in its fold for sewing. With 981 American books 14 per cent. only were in the strong way of the grain, whilst with no less than 86 per cent. the grain of the paper was in the length of the book, and therefore the sewing was through the weakened fold of the leaf." After describing other tests, Mr. Chivers comes to the conclusion "that when a book is made of paper the fibrous direction of whose grain is down the page, and it is folded and pierced for sewing, a loss of tensile strength ensues of not less than 75 per cent." By testing, Mr. Chivers ascertained that with oversewing properly done the paper is not weakened nearly so much, and he therefore uses his patent method of sewing extensively. Fig. B is reproduced from his patent specification. By this method a series of holes is first punched in a slanting direction through the side of each section of leaves by a perforating machine. The holes are arranged in three parallel rows in such a manner that the holes are disposed throughout the length of the sections alternately in pairs and singly. From the specification the following description is extracted: "Fig. 1 is a diagrammatic view in perspective of a number of sections showing the passing and repassing of the thread therethrough, and Fig. 2 is an end view diagram partly in section showing the arrangement of the perforations in the sides of the sections and their upward direction. . . . Sections *a*, *b* (Fig. 1) are end sections which have been attached to each other by sewing through the sides in any convenient manner, and the sections *c* and *d* have been partially attached thereto and to each other by the system of stitching hereafter fully described, and a fresh section *e* is about to be added to *a*, *b*, *c* and *d*. For this purpose the thread *x* is brought from section *b* over the sections *c* and *d*, and is passed in at the lower hole of the end pair in row 1 of section *e*, and upwardly through the end hole of the middle row 2 of section *d* and out through the upper hole of the end pair in row 3 of section *c*, when it is taken back over the top edges of the sections to section *e* again, and enters the lower hole of the next pair in row 1, repeating its former passage in a fresh set of holes further along the row, each time from left to right of Fig. 1, until the row is complete, when a fresh section *f* is added, and the thread is brought over and again commences with the lower hole of the first pair in row 1 of the fresh section *f* and passes through the holes in the same order as before, but in the reverse direction, that is, from right to left of Fig. 1, until it arrives at the end of the section last applied, which operation is repeated until the book is complete. . . . By such a system of stitching, therefore, each section, with the exception of the end sections as above described, is indirectly attached to all the rest, and directly attached to the two next or adjacent sections on either side of it."

After the Chivers patent sewing came another patent method of sewing by Mr. Frank Holloway and Percy Walter Williams. The former gentleman was at one time in the employ of Mr. Cedric Chivers, then he became a proprietor of the Anglo-American Binding Co., of Reading, and at the present time he is a director of the Pacific Library Binding Co., of Los Angeles, California, U.S.A. This method of sewing, like the Chivers sewing, is accomplished by passing the thread through perforations in the sections, but the thread goes straight through and not diagonally. Fig. C is a reproduction of the three illustrations which accompany the patent specification. Fig. 1 shows the perforations of a section; Fig. 2 illustrates one section in which the thread is passed through alternate perforations; and Fig. 3 is an edge view of four sections, lettered respectively *a*, *b*, *c*, and *d*, while the spaces between are lettered a^1, a^2, a^3. The method of sewing is thus described: "The

FIG. 1.

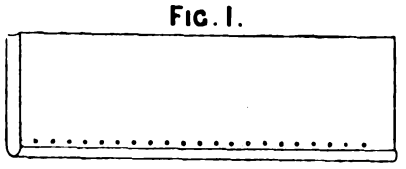

FIG. 2.

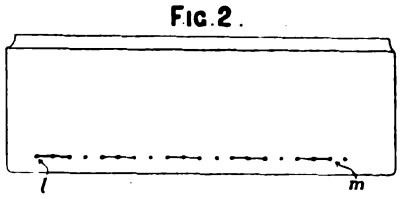

FIG. 3.

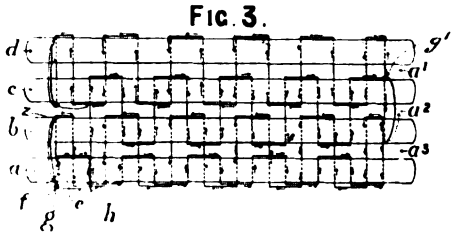

Fig. C.

thread *e* is first passed through alternate perforations of the section *a*, commencing with the first perforation and ending with the last, as clearly indicated by the arrows in Fig. 3; it is then passed through that perforation in section *b* which corresponds with the last perforation in section *a*, down through the next perforation of section *b*, and through the corresponding perforation of section *a*, and then through alternate perforations of both *a* and *b* to the starting point. The thread *e* is then carried to point *z* (Fig. 3), and back to the starting point, where it is firmly knotted as at *g*. By this means a loop *f*, consisting of two strands of thread, will be formed, thus holding

Digitized by Google

the two sections *a*, *b*, securely together. The thread *e* is now passed at *h* through the sections a, *b*, and *c*, and through alternate perforations in *c* and *b*, and knot g^1 is formed in a manner similar to that above described. Subsequent sections are sewn together in a like manner until the book is completely sewn." By referring to the third drawing of Fig. C. it will be observed that, with the exception of the locking stitches at each end of the book—corresponding to the kettle-stiches of hand sewing—all the stitches lie between the sections, thus leaving the back even and free from stitches.

No system of overcasting renders books as flexible as those sewn by the ordinary method of hand sewing, and therefore while one may commend those binders who do their best to devise methods of sewing to overcome the difficulties presented by books printed on inferior papers, one cannot but wish that publishers would adopt a higher standard for book production, and only use paper that has strength and lasting qualities.

Papermaker v. Bookbinder.

In an article on "Strength Factors in Paper as Related to Binding," in the January number of the *Printing Art*, Mr. Wm. B. Wheelwright analyses Mr. Cedric Chivers' (of Bath) pamphlet on the "Paper and Binding of Recent Lending Library Books." The greater part of the article consists of extracts from the pamphlet, but Mr. Wheelwright's own views on the subject are stated as follows:—

People often remark upon the delightful lightness of English books, and ask complainingly why we can't make such light paper in America. They do not stop to consider the unnecessary thickness of the pages in so many of these featherweight books, nor do they often realise that this quality of fluffy lightness is the bane of all bookbinders. Such papers receive so little pressing in their manufacture that, considered by the cubic inch, they would contain about seventy per cent. air space. In other words, they are so lacking in density, and are so loosely compacted, that their strength is almost nil. Given two sheets of paper of similar fibrous constituency and weight, the denser of the two will have the greater tensile strength, except in very extreme cases where the paper has been too hard calendered.

The principal deduction which Mr. Chivers makes from all these considerations, is that the book manufacturer should confine the thickness of the paper between 3·5 and 6·5 one thousandths of an inch, and should have the grain run across the page if the book is to be sewed in the ordinary manner. He overlooks, however, the effect of moisture from the glueing. If the paper grain runs across the page the paper expands, when glued, up and down the page, resulting frequently in a very marked cockling. Some catalogues especially that have come to my notice have been seriously marred in appearance from this very thing. Mr. Chivers makes, moreover, no account of the stiffness of volumes in which the paper is cross-grained. This feature alone is conducive to harder handling from the reader, who, in his efforts to open up the volume so as to read more easily the words near the back margins, is very apt to seize it in both hands and break the book's back in his efforts to supply the flexibility which is lacking. It seems to me that in the first place publishers should abandon the bulky featherweight papers, as they have no binding strength. Paper no more expensive, made from precisely the same stock, only more densely compacted, would be very much more serviceable. To be sure their volumes would appear thinner, but if any considerable number of the leading publishers should, in the interests of better bookmaking, agree on this change of policy, the majority would soon follow. Nor would it require any great ingenuity for sales managers to educate buyers to a more sensible appraisal of book values than that given by the impression of mere bulk. If publishers cannot be persuaded to take this viewpoint, it would certainly be preferable, from the standpoint of serviceability, to run the grain of the paper across the page when using weak papers, in spite of the attendant disadvantages of inflexibility and cockling in the back of the book. Probably after more thought is given to the physical characteristics of paper, there will be a reaction on the part of wise publishers, both from the limp, thin Bible papers and from the fluffy, loose-made featherweight ones to the safe, sane, middle course to which experience and intelligence point.

BOOKBINDER,
Author, Publisher, Librarian, General Reader,
"BUSINESS OF BOOKBINDING,"
By ALEX. J. PHILIP,
6/- Net.
STANLEY PAUL & CO., 31, Essex Street, W.C.

Guessing at the Binding.

Estimating by printers on binding in the past, as we all know, was merely guessing at what we considered a job ought to be worth, and the more information and experience that can be brought to bear on the subject the closer shall we come to the mark. Suppose, for instance, a price is being quoted for printing 1,000 16 page pamphlets 6 by 9, bound with two wire stitches; you can figure the paper, composition and press-work fairly well, but when it comes to the binding you are apt to consider such a small affair as being worth, say $1 or $1.25 (4s. to 5s.) at the outside, and let it go at that. Now, the average wage of any experienced girl is $7 a week or say 15 cents per cents per hour, overhead expenses will easily add at least 100 per cent. to this, making in round figures 30 cents (1s. 3d.) per hour. It will take a girl three hours to fold 1,000 sheets and another hour to stitch them, with an extra half-hour to band the books in twenty-fives after trimming. This makes four and one-half hours for a girl at 30 cents, or $1.35; half an hour for a cutting machine at $1 per hour, and 3 cents for wire brings the total cost to $1.88; 25 per cent added to this makes $2.35, which is exactly what should be received for doing this work, to make a reasonable profit. I have no hesitation in saying that many of our mistakes in estimating are caused by quoting prices at what it is considered a job should be done, instead of relying upon results shown by a reliable cost system.

The machinery for a bindery should be installed with regard to the different operations necessary to binding, and care should be exercised to lay out the bindery in such a manner that the work is kept travelling in one direction as much as possible, in order to save time in handling. Provision should be made to not only keep the machinery clean and in a state of efficiency, but the whole bindery should be kept neat and tidy, a place for everything and everything in its place. The influence of a clean, sanitary work-room should not be lost sight of; the difficulty of keeping help is considerably lessened, and the work will be greatly influenced by the circumstances under which it is produced.—J. H. Johnston, Montreal.

For the supply of new books to the West Ham Corporation, the tender of Messrs. Truslove and Hanson has been recommended for acceptance.

The following tenders have been recommended for acceptance by the Hammersmith Borough Council:—Printing: J. Truscott and Son, Ltd., Suffolk-lane, E.C.; newspapers: W. H. Smith and Son, 185, Strand; new books: Truslove and Hanson, Ltd., 153, Oxford-street.

Bookbinders' MACHINERY and SUPPLIES

Some Patent Methods of Sewing.

By GEO. A. STEPHEN

(Joint Author of "Manual of Library Bookbinding.")

One of the most important factors which determine the physical life of books is the quality of the paper, and, unfortunately, the durability of books within the last decade or so has been disastrously affected by the general use of inferior qualities of paper. Publishers are generally more concerned with low prices than with the quality and serviceability of books, and, consequently,

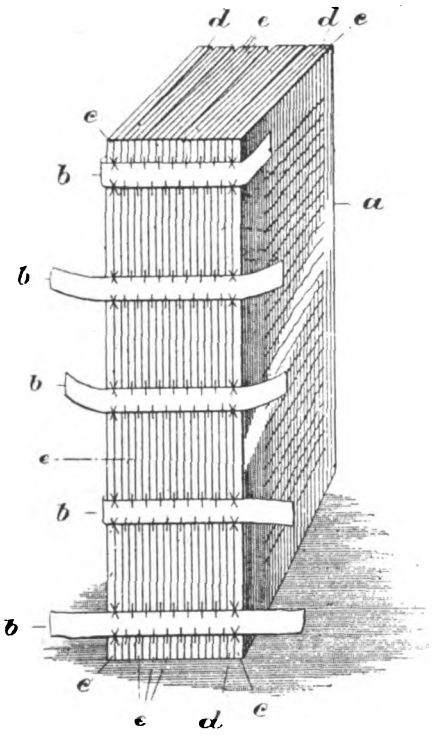

Fig. A.

featherweight paper is largely used for their books, to the regret of binders, who cannot sew such paper satisfactorily by the ordinary methods of sewing.

Necessity being the mother of invention, several binders who make a speciality of binding for public libraries have invented special methods of sewing, with the object of overcoming the difficulties which beset binders when sewing books printed on paper of poor quality. The firm of B. Riley and Co., of Huddersfield, has patented a method of sewing, the object of which is to reduce the tension put upon the paper by the thread, and thus prevent the tearing of the leaves at the folds. By this invention the kettle stitches at the head and tail of the book are dispensed with, and tapes substituted. The stitches pass through these tapes, and also through the usual intermediate tapes, instead of employing the usual method of sewing over the tapes. It is thus claimed that any strain or tension is borne by the tapes instead of by the paper, and the different sections which comprise the book are secured together over the whole surface of their back edges instead of only at the top and bottom. The first two and last two sections are sewn "two sheets on all through," so that the tapes of these end sections are stitched down on both sides. Fig. A is a reproduction of the illustration accompanying the specification, which thus describes the method: "This drawing represents the body of a book *a* without covers, in which five tapes *b* are employed, though the number of such tapes will, of course, vary according to circumstances. As will be seen, each of the outer sections, *c*, *c*, is attached to the next section *d*, as well as as to the tapes, by twenty stitches, whilst each inner section *e* is secured to each of the five tapes by one stitch, the stitches in this case crossing the edges of the tapes alternately as shown. Each section *e* is thus secured at five places to the tapes and through each tape to the adjacent sections on each side."

For public library books the ordinary method of oversewing is objectionable, because the books are then very inflexible, and the paper soon tears after constant handling by the borrowers. The books are prepared for the ordinary method of oversewing by having the sections trimmed at the back in order to convert the book into a pile of single leaves. The back edges are then roughened with the side edge of a saw, and the back is glued up. When the glue is dry the book is separated into thin sections, each of which is overcast or oversewn, by passing the needle through and through the side of the section, bringing the needle over after each stitch. From the third section onwards, the two preceding sections are generally sewn through each time a fresh section is sewn; thus each section contains three times as many stitches as were inserted during the sewing of one section. During the past twenty years the firm of A. O. Heyner and Co., of London, has adopted a method of oversewing which effectively meets the requirements of cheap books that need to be oversewn. By Heyner's method the sewing is partly done by a machine that stitches small quantities of the single leaves which have been made up into sections in the usual way, prior to overcasting. The sections, after being provided on either side with a strip of linen to prevent the paper from being torn, are stitched through the side by a machine, nearly one-quarter of an inch from the back. The sections are then sewn on to tapes in the ordinary way.

Mr. G. F. Ayling, of the Bedford Bindery, has patented a method of sewing which in some respects resembles Heyner's method. According to the specification, the *modus operandi* is as follows. After the back folds have been cut off by a guillotine the back edges are glued, and, when dry, saw cuts are made for the purpose of the usual kettle stitches. "After this the book is divided into a number of sections, 6, 8, 10 or 12 sheets, depending on the thickness and quality of the paper, and in rotation each section is machine-stitched along the back edge, about one-sixteenth of an inch therefrom, by a lock stitch of about half-an-inch in length. Such mode of stitching creates a straight and true new fold for its respective sectional leaves, and such leaves do not easily yield to tearing. The stitching is then rolled into the paper or the like. The numerous sections thus formed are then in readiness for any of the subsequent methods of sewing them together."

Fig 1

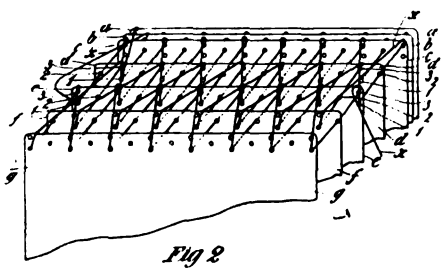

Fig 2

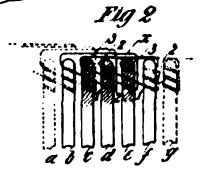

Fig. B.

Mr Cedric Chivers, of Bath, who has effected a number of patents for improved methods of binding, has patented a method of overcasting which is a decided improvement over the ordinary one. In his book entitled "The Paper and Binding of Recent Lending Library Books," published in 1909, he states that a few years ago he tested the paper of some five thousand books, and, as a result, "an average difference in strength was discovered between the machine way of the paper and the cross direction of no less than 45 per cent." He also discovered that, "With 3,717 English books 66 per cent. of the papers showed the grain to be across the page, that is, in the strong way for binding. Thirty-four per cent. of the papers exhibited the grain up and down the page, making the book weak in its fold for sewing. With 981 American books 14 per cent. only were in the strong way of the grain, whilst with no less than 86 per cent. the grain of the paper was in the length of the book, and therefore the sewing was through the weakened fold of the leaf." After describing other tests, Mr. Chivers comes to the conclusion "that when a book is made of paper the fibrous direction of whose grain is down the page, and it is folded and pierced for sewing, a loss of tensile strength ensues of not less than 75 per cent." By testing, Mr. Chivers ascertained that with oversewing properly done the paper is not weakened nearly so much, and he therefore uses his patent method of sewing extensively. Fig. B is reproduced from his patent specification. By this method a series of holes is first punched in a slanting direction through the side of each section of leaves by a perforating machine. The holes are arranged in three parallel rows in such a manner that the holes are disposed throughout the length of the sections alternately in pairs and singly. From the specification the following description is extracted: "Fig. 1 is a diagrammatic view in perspective of a number of sections showing the passing and repassing of the thread therethrough, and Fig. 2 is an end view diagram partly in section showing the arrangement of the perforations in the sides of the sections and their upward direction. . . . Sections *a*, *b* (Fig. 1) are end sections which have been attached to each other by sewing through the sides in any convenient manner, and the sections *c* and *d* have been partially attached thereto and to each other by the system of stitching hereafter fully described, and a fresh section *e* is about to be added to *a*, *b*, *c* and *d*. For this purpose the thread *x* is brought from section *b* over the sections *c* and *d*, and is passed in at the lower hole of the end pair in row 1 of section *e*, and upwardly through the end hole of the middle row 2 of section *d* and out through the upper hole of the end pair in row 3 of section *c*, when it is taken back over the top edges of the sections to section *e* again, and enters the lower hole of the next pair in row 1, repeating its former passage in a fresh set of holes further along the row, each time from left to right of Fig. 1, until the row is complete, when a fresh section *f* is added, and the thread is brought over and again commences with the lower hole of the first pair in row 1 of the fresh section *f* and passes through the holes in the same order as before, but in the reverse direction, that is, from right to left of Fig. 1, until it arrives at the end of the section last applied, which operation is repeated until the book is complete. . . . By such a system of stitching, therefore, each section, with the exception of the end sections as above described, is indirectly attached to all the rest, and directly attached to the two next or adjacent sections on either side of it."

After the Chivers patent sewing came another patent method of sewing by Mr. Frank Holloway and Percy Walter Williams. The former gentleman was at one time in the employ of Mr. Cedric Chivers, then he became a proprietor of the Anglo-American Binding Co., of Reading, and at the present time he is a director of the Pacific Library Binding Co., of Los Angeles, California, U.S.A. This method of sewing, like the Chivers sewing, is accomplished by passing the thread through perforations in the sections, but the thread goes straight through and not diagonally. Fig. C is a reproduction of the three illustrations which accompany the patent specification. Fig. 1 shows the perforations of a section; Fig. 2 illustrates one section in which the thread is passed through alternate perforations; and Fig. 3 is an edge view of four sections, lettered respectively *a*, *b*, *c*, and *d*, while the spaces between are lettered a^1, a^2, a^3. The method of sewing is thus described: "The

FIG. 1.

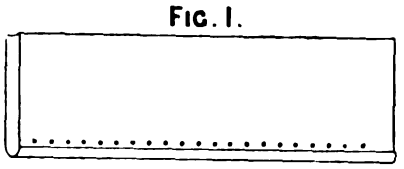

FIG. 2.

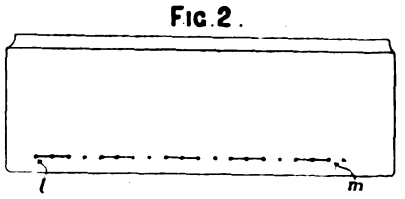

FIG. 3.

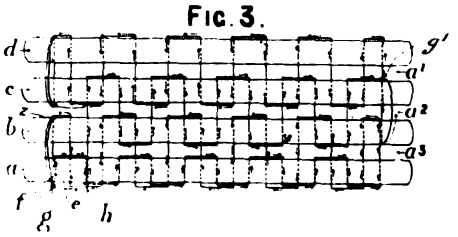

Fig. C.

thread *e* is first passed through alternate perforations of the section *a*, commencing with the first perforation and ending with the last, as clearly indicated by the arrows in Fig. 3; it is then passed through that perforation in section *b* which corresponds with the last perforation in section *a*, down through the next perforation of section *b*, and through the corresponding perforation of section *a*, and then through alternate perforations of both *a* and *b* to the starting point. The thread *e* is then carried to point *z* (Fig. 3), and back to the starting point, where it is firmly knotted as at *g*. By this means a loop *f*, consisting of two strands of thread, will be formed, thus holding

Digitized by Google

the two sections *a*, *b*, securely together. The thread *e* is now passed at *h* through the sections a, *b*, and *c*, and through alternate perforations in *c* and *b*, and knot g^1 is formed in a manner similar to that above described. Subsequent sections are sewn together in a like manner until the book is completely sewn." By referring to the third drawing of Fig. C. it will be observed that, with the exception of the locking stitches at each end of the book—corresponding to the kettle-stiches of hand sewing—all the stitches lie between the sections, thus leaving the back even and free from stitches.

No system of overcasting renders books as flexible as those sewn by the ordinary method of hand sewing, and therefore while one may commend those binders who do their best to devise methods of sewing to overcome the difficulties presented by books printed on inferior papers, one cannot but wish that publishers would adopt a higher standard for book production, and only use paper that has strength and lasting qualities.

Papermaker v. Bookbinder.

In an article on "Strength Factors in Paper as Related to Binding," in the January number of the *Printing Art*, Mr. Wm. B. Wheelwright analyses Mr. Cedric Chivers' (of Bath) pamphlet on the "Paper and Binding of Recent Lending Library Books." The greater part of the article consists of extracts from the pamphlet, but Mr. Wheelwright's own views on the subject are stated as follows:—

People often remark upon the delightful lightness of English books, and ask complainingly why we can't make such light paper in America. They do not stop to consider the unnecessary thickness of the pages in so many of these featherweight books, nor do they often realise that this quality of fluffy lightness is the bane of all bookbinders. Such papers receive so little pressing in their manufacture that, considered by the cubic inch, they would contain about seventy per cent. air space. In other words, they are so lacking in density, and are so loosely compacted, that their strength is almost nil. Given two sheets of paper of similar fibrous constituency and weight, the denser of the two will have the greater tensile strength, except in very extreme cases where the paper has been too hard calendered.

The principal deduction which Mr. Chivers makes from all these considerations, is that the book manufacturer should confine the thickness of the paper between 3·5 and 6·5 one thousandths of an inch, and should have the grain run across the page if the book is to be sewed in the ordinary manner. He overlooks, however, the effect of moisture from the glueing. If the paper grain runs across the page the paper expands, when glued, up and down the page, resulting frequently in a very marked cockling. Some catalogues especially that have come to my notice have been seriously marred in appearance from this very thing. Mr. Chivers makes, moreover, no account of the stiffness of volumes in which the paper is cross-grained. This feature alone is conducive to harder handling from the reader, who, in his efforts to open up the volume so as to read more easily the words near the back margins, is very apt to seize it in both hands and break the book's back in his efforts to supply the flexibility which is lacking. It seems to me that in the first place publishers should abandon the bulky featherweight papers, as they have no binding strength. Paper no more expensive, made from precisely the same stock, only more densely compacted, would be very much more serviceable. To be sure their volumes would appear thinner, but if any considerable number of the leading publishers should, in the interests of better bookmaking, agree on this change of policy, the majority would soon follow. Nor would it require any great ingenuity for sales managers to educate buyers to a more sensible appraisal of book values than that given by the impression of mere bulk. If publishers cannot be persuaded to take this viewpoint, it would certainly be preferable, from the standpoint of serviceability, to run the grain of the paper across the page when using weak papers, in spite of the attendant disadvantages of inflexibility and cockling in the back of the book. Probably after more thought is given to the physical characteristics of paper, there will be a reaction on the part of wise publishers, both from the limp, thin Bible papers and from the fluffy, loose-made featherweight ones to the safe, sane, middle course to which experience and intelligence point.

Composing Machines.

In a composing or type-bar-making machine, patented by Messrs. B. Cade and A. A. Heldrich, the matrices are carried by a series of rotatable sectors 5, Fig. 2, having radial laterally-flexible stems 8. The stems have at their outer ends heads 9, Fig. 21, in which slide the shanks 11 of the matrices 10. Each stem supports two matrices which may bear upper and lower case characters respectively, and are movable independently or together. The matrices have apertures 128 at the upper ends of which are inclined surfaces 129 for aligning the matrices. The sectors are enclosed in a housing comprising a fixed section 17 and a movable section 18, the two sections being separated at intervals to form an opening through which the matrices can move to the mould 161. The sectors are rotated, in

order to position the matrices, by springs 45 attached to sliding heads 42 which are connected by links 41 to arms 40 on the sectors. The sectors are held in, and are returned to normal position by a cam-actuated bar 33. The amount of rotation imparted to the sectors is determined by a series of sliding setting bars 46, Fig. 3, which are adjusted by keys and are then interposed in the path of the heads 42. The setting bars are urged to the right by springs 53 and are held against movement by racks and detents 71. The keys 76 operate a series of pivoted frames 77 of varying size, which, when raised, serve as stops for the setting bars 46. The detents 71 are successively raised to release the bars 46 by a member 84, which is operated by the frames 77 and is moved step by step transversely of the series of detents by an escapement mechanism. After the bars 46 have been adjusted for the whole line, they are raised into the path of the heads 42 and the matrix-sectors are thereby set. The composition of the next line can then be commenced. When matrices of more than one case are used, shift-keys are employed which act on the member supporting the frames 77.

Clamping and Aligning Matrices.—The matrices are aligned by a bar 130, Fig. 19, which is moved by a rack-and-pinion through the holes 128 in the matrices and is then raised by elevating members 132, 133 to carry the line against the mould 161. The line is held between jaws 162, 163, which are mounted on the bottom of the mould, and are moved to and from each other by a right and left-handed screw operated by a mutilated gear-wheel on the main shaft.

Justifying Matrices.—A spacer is carried by one of the stems of each sector and comprises a member 13, Figs. 3 and 23, having an inclined dove-tailed groove in which a tapered member 14 slides at right angles to the member 13. The spacers of the assembled line are adjusted by a cam-actuated bar 171, Fig. 2, which engages the members 14 and first contracts the spacers so that the line may pass between the jaws 162, 163 and then expands them to fill out the line.

Driving Mechanism.—The main shaft 31, Fig. 2, carrying the cams which operate the parts of the machine is driven through a one-revolution clutch comprising a continuously rotating notched disc which is engaged by a spring bolt on the driven member. The bolt is withdrawn after one revolution by an incline, and is released to start the machine by means of a hand-lever.

Teaching the Young Idea.

The New York School for Printers' Apprentices.

Mr. A. L. Blue, the director of the School for Printers' Apprentices of New York, but recently established, writing in the *Printing Trade News*, says that it is unique in its conception and operation in that "it is the only instance, so far as I am aware, where an association of employers, the unions and an institution interested in educational work have met on common ground and joined hands in the work of properly training the apprentice. The formation of such a school is not the result of spontaneous effort. It is the outgrowth of patient thought and experiment not only by the Hudson Guild, who took the initiative in the matter, but by the committee from the Printers' League and the New York Typographical Union. While it is not claimed that this is the *only* school, I believe the foundation to be so practical that its permanency is assured. I also believe its usefulness will spread and in time similar schools will be established in other cities." The school has commodious quarters in the building of the Hudson Guild, 436–438, West Twenty-seventh-street, Manhattan. At present three classes are in session.

None but registered apprentices of the New York Branch No. 1 of the Printers' League and Typographical Union No. 6 are accepted as pupils; no apprentices are eligible unless they have had at least two years' experience in the composing-room, and the school is not a machine for creating more printers. It is intended to supplement the knowledge gained in the composing-room, and as a finishing school for apprentices to mould them into skilled craftsmen.

The school is financed and managed by the Advisory Board, consisting of four members each from the Printers' League, Typographical Union and Hudson Guild. This Board, which dictates the policy of the school, meets each month to transact routine business and to pass on the application of apprentices to the school; to examine a report of the standing of each pupil, showing attendance and percentage of proficiency in the trade as well as their advancement along educational lines, comprising English composition, grammar, spelling, punctuation, division of words, proper use of italic, indentation, etc.

A bulletin is issued at the school each month which contains the proceedings of the Board and a list of the pupils with the percentage attained in their studies. The day classes are on Monday, Tuesday, Wednesday and Thursday afternoons from 2 to 4. These classes are intended for boys employed on morning newspapers who would be unable to attend at night. The night classes are on Monday and Wednesday and Thursday and Friday nights, from 7.30 to 9.30. Apprentices are expected to attend two nights each week.

There are at present ninety-six pupils in regular attendance at the school. Only registered apprentices who have served two years at the trade are admitted. A card showing their attendance is presented to the instructor each class night; the date on which they attend is then punched, and this card must be shown to the chairman in the office where the apprentice is employed on the following day. The chairman keeps a record of the attendance of the apprentice, furnishing on the first of each month both the plant owner and the union a report on a blank furnished for the purpose. By this method uniform attendance is developed, as the influence of the employer and union is communicated to the boy by the recording of his attendance.

Forty-five minutes' work in English composition, grammar, spelling, punctuation, etc., precedes the regular work each day and evening. Text books on these subjects are furnished the boys for study in spare moments outside of the classes. The work of teaching is conducted by three competent instructors.

Contrary to the usual plan of starting the apprentice at the bottom and drilling him in the smaller details of the trade, he is given manuscript copy for display work of various kinds. No directions are imposed as to style, but after carefully considering the copy, he is to make a rough draft of the job, showing arrangement, together with style and size of type which is thought most appropriate. In this work he has access to various samples of such work as is current in the trade and a chart containing a list of type used in the school, each fount being numbered to correspond with the number on the case. This layout is then shown the instructor, and if it appears practical the apprentice is allowed to proceed with the work. If not considered feasible the errors are pointed out and a new layout is prepared. While an exact layout cannot always be faithfully carried out, repeated changes, sometimes simple, sometimes complex, secure the desired result.

The main point is to get the boy to *think it out*. "I find that this plan acts as a stimulus, where simpler details tire, and yet the details actually enter into the work as it progresses. I accentuate display not only because it is the foundation on which rests much of the work in a printing office, but because about

Digitized by Google

nine out of every ten printers lack proficiency in this branch.

Other work common in the printing office is taught, such as colour forms, blank and tabular work, make-up, imposition, casting up copy, distribution, etc. In whatever branch of the trade the boy shows the most aptitude he is encouraged and coached accordingly.

The advantages offered in a school of this type are apparent to every thinking printer, but it may be well to mention a few of them. In the printing office the first *real* work given the apprentice is reprints. Aside from the handling of the type he can gain no more knowledge than is possible by the study of printed forms. Very few apprentices get any other kind of work until their full time is served. Then they receive only such jobs as are current in the office where they are working, thus limiting their knowledge of the various forms of work produced in other offices.

It can be readily understood that by the methods outlined the boy can get a better and wider range of knowledge in the school in the few hours he attends each week than would be possible to acquire in years in the printing office.

As an indication of the interest taken in the school by the apprentices, a glance at their addresses show that a very large per cent. of the pupils live in Brooklyn, Long Island and New Jersey.

It is a hardship for a boy after a day's work to attend the night classes, and doubly so when he lives at a distance. It is hoped that eventually we may secure the consent of employers to allow the boys to attend during at least one afternoon during the week.

It is not the purpose of the school to create more, but *better* printers. There is a decided advantage in admitting boys who have served two years in an office. They have been sifted, are fit, and show staying qualities; the experimental stage is thereby eliminated.

The intelligent printer cannot but realise that the new day for printing has arrived. Old methods will not do. A better type of workman must be evolved. With this idea in view it is the desire of all concerned in the project of the school to keep it at the highest possible standard; to help produce workmen who will not only be a credit to the craft but a paying investment to the proprietor.

PRINTERS AND FOOTBALL COUPONS.—At a conference to discuss the evils of football coupon betting, held in Manchester recently, promoted by the Lancashire, Cheshire and District anti-Gambling League, one of the speakers was a Manchester printer, who said he was "on the turf" in his young days. Until a few years ago he had (he said) printed a large number of betting coupons. There were 100,000 coupons printed in Manchester every week. One printer had been offered £10 a week by four bookmakers to do their work. In nine of ten printing offices he knew the foremen received a commission for distributing coupons, and in most cases the employers shut their eyes to the practice. The odds were reckoned in such a scientific way that backers had no chance in the long run. The following resolution was adopted:—"That this meeting cordially supports the Football Betting and Gambling Bill, 1913; and, on account of the urgent and pressing need for such legislation, earnestly hopes that it will become law during the present session of Parliament."

BRIDGET is learning to set type in her father's office. She also goes to night school. Recently her teacher, in a talk on capital letters, asked the class: "How should you begin a sentence?" "With an em quad!" said Bridget, and the puzzled teacher is still wondering just what kind of a thing an em quad is.

The Condition of the Labour Market

IN THE

PRINTING AND ALLIED TRADES.

HOME.

According to the Labour correspondents of the Board of Trade, whose reports appear in the *Labour Gazette* for the current month, employment during February in the printing trades was fair, and better than a month ago and a year ago. (See Table.)

Districts.	No. of Members of Unions at end of February, 1913.	Percentage Unemployed at end of			Increase (+) or Decrease (—) on a	
		Feb., 1913.	Jan., 1913.	Feb, 1913.	Month ago.	Year ago.
London	21,259	4·4	5·8	7·0	— 1·4	— 2·6
Northern Counties and Yorkshire ...	5,721	3·0	4·3	4·0	— 1·3	— 1·0
Lancs. and Cheshire	7,230	4·0	4·7	6·3	— 0·7	— 2·3
East Midland and Eastern Counties ...	2,713	2·0	2·7	2·4	— 0·7	— 0·4
West Midlands	2,663	2·9	3·2	3·8	— 0·3	— 0·9
S. and S. W Counties and Wales ...	4,053	2·3	2·8	2·3	— 0·5	...
Scotland	5,198	4·3	4·2	3·4	+ 0·1	+ 0·9
Ireland	2,564	6·4	7·2	8·5	— 0·8	— 2·1
United Kingdom	51,401	3·9	4·9	5·5	— 1·0	— 1·6

In London, employment was fair generally, and better than a month ago and a year ago. With letterpress printers at Edinburgh employment was slack, and worse than a month ago. At Bradford and at Hull employment was only moderate. At other principal centres it was fairly good, and better than a month ago and a year ago, though at Glasgow there was some decline as compared with February, 1912. With lithographic printers employment was quiet generally.

FOREIGN.

From France it was reported that the printing trades were not quite so busy during January, especially in Paris. In Germany, however, trade improved, the percentage of unemployed trade unionists in that line falling from 4·7 in December to 3·5 in January, out of a total membership of 65,535. In January, 1912, it was 2·7.

Printing in Japan.

Mr. Fritz Kummer, writing in our excellent contemporary, the *American Pressman*, on the art of printing as practised in Japan, gives his experience of a visit to a printing office in the Land of the Rising Sun as follows:—

As soon as we stepped into the composing-room all employees came as close as possible in order to take a good look at the strangers. This bunch of Gutenberg's disciples, which came tripping along on wooden sandals, was not such a bad lot to look upon. They rather looked like practical people; this you could easily see by their working clothes, which in my estimation couldn't be made more simple or cheaper. It consisted of a narrow strip of cloth folded between their lower limbs and the ends slung around the loins. This was the whole garment; nothing else obstructed the free motion of any part of the body or limbs. Of course, some of our civilised brothers may object to this outfit, but will not deny that it is the cheapest and most practical for hardening your body. Not all of the employees were "dressed," as described above. Some young girls—in our estimation between 14 and 16 years old—hobbled alongside of us, bowing awkwardly, their hair done up neatly, wearing a kimono, which covered the whole body.

The type was arranged in big boxes, reaching way up to the ceiling. On a kind of an elevated stand the typo was jumping around gathering the different letters out of the ungainly boxes, to hand them to the girls below, who again carried them away to their respective places. The working pace of these people is the limit of leisurely action, and the defender of passive resistance will undoubtedly enjoy to look upon those Japanese disciples of Gutenberg. The difficulty of setting type finds its explanation in the complication of the letters. Our typesetters are only using twenty-six different types, whereas his Japanese brother has to handle thousands. The Chinese method demands a certain type for each syllable or letter, a modern printshop therefore to meet all demands must have at least 6,000 different styles. Lately they have even added to these Chinese letters a Japanese alphabet consisting of fifty letters. This was necessary for the reason that the language had taken in many foreign technical, literary and other terms.

At the beginning of the new era when western technic, medicine, literature, etc., was only poorly represented, and also for the newly appearing terms of the native language they started to cast separate types for each different word. But with the steady increase of those foreign expressions this method was getting more and more complicated and they thought to relieve this defect by creating a Japanese alphabet, which helped to a certain extent, but made the already hard work of the typesetter still more difficult. As soon as the neceesary types are gathered out of those big boxes the matrices are made and the process of printing follows just as in our country.

You will ask now how much does a Japanese printing emyloyee earn, which question is somewhat hard to answer for a foreigner. This is to say, should you even know the wages received, you could not form a correst idea of how far this amount will go in buying life's necessities, and to ascertain the real condition of any particular working-class you must study the domestic situation, which will show you the intrinsic value of the respective wage. And even then you have not gained much, as this knowledge would not be sufficient to compare conditions with our working-class and those of a foreign country, as it does not give you information enough whether your brother in Japan can afford to live or dress better and has more leisure hours to himself; all these items would take up too much space in this article, and I will content myself by touching some of the most important facts.

First, I will answer the above put question: How much does a Japanese printing employee earn? The industry of Japan counts, not figuring the State and mining works, 15,000 establishments, thereof are 962 belonging to the printing craft—408 machine and 554 hand operators—with 21,322 employees (18,687 men and 2,635 girls). A pressman's average scale in 1909 was 23c. per day at a

Digitized by Google

twelve-hour day, and a typesetter in Tokio received 32c. under the same conditions. More you cannot learn from the Japanese statistics of the printing trade. These scanty wages show that the Japanese printing employee is not to be envied. And yet does he rank as one of the best paid working men in his country. There are a great many others who would only be too glad to receive the above amount.

It is clear that such miserably paid working men must lead a somewhat economical life; the single man may manage to get along, but pity the man with a family—he has to send wife and children out to hunt work or else see them starve. Even taking all the earnings of the whole family together it couldn't by far be compared with any of the lowest wages earned in our country. That the Japanese working man finds his life worth while you may attribute to the low cost of living, his easily attained satisfaction and his economy. He is satisfied to fill his stomach with ordinary rice and bitter tea, only once in a while treating himself to a little fish. He lives mostly in one or two small rooms, bare of any furniture, and his whole home life is enacted on the floor of his barren den.

The Japanese printing employees are counted, as mentioned above, the aristocrats of the working-class in their country, and they are the only craft who to-day have an organisation; of course, not in the sense of our labour unions, but an organisation anyhow.

In 1911, 300 of the employed typesetters and pressmen in the foreign newspapers started an organisation after the example of their brothers in Tokio. Both organisations succeeded in making contracts with their respective employers, in which the latter bind themselves to put only members of the organisation to work, and in return the organisation will at all times furnish enough help. The employers further agreed to pay each workman, should it be necessary to lay him off after serving longer than three years, the princely sum of 10c: per month until he is needed again.

This, you will say, is little enough; but for Japan, as the first beginning, it means a whole lot gained.

QUADS.

[We do not necessarily identify ourselves with any opinions of our contributor. At the same time, readers will not need to be assured that he always endeavours to communicate something worthy of attention.]

"I hold every man a debtor to his profession, from the which, as men do of course seek to receive countenance and profit, so ought they of duty to endeavour themselves by way of amends to be a help and an ornament thereunto."
FRANCIS BACON, Baron Verulam.

Honestly, I can't advise anyone to be an idiot.

o o o

"Thank you for nothing." Oh, but my dear sir, let me explain.

o o o

A bit of the very little Greek I retain is enough to recall that "idios" is a Greek word, and its implication is "one's own, something peculiar to oneself." The Greeks used to give a four-syllabled name to a certain type of man. They called him an "idiotes."

o o o

They meant by the term some man who was not good enough for any sort of responsible official position. Their idea was that all possessing the best wits and the most liberal education would be found discharging some or other responsibility in public service.

o o o

It looks very much as though the Greeks in their palmiest days regarded at best with a tolerant indifference, and at worst with an absolute contempt, any man whose purview was bounded by just his own supposed personal interest. As a community they had no use for him—he was an idiotes.

o o o

From the same root, idios, comes idiom—some mode of expression which is peculiar to a language, something that is its very own; and idiosyncracy, some peculiarity of temperament or constitution, which, again, is one's very own. Idiolatry, again, is the worship of oneself.

o o o

Fifty years ago, when the doctrine of each for himself and the devil take the hindmost had its strongest hold upon the English mind, we seemed rather disposed to reason in an exact contrary to Greek thought. A good many seemed prepared to label as an idiot any man who did give a thought to any concern other than his own.

o o o

It is no doubt true that every man must more or less bear his own burden, and also true that in the action and interaction of life no man can quite develop everything that is potential in himself, save in relation to the community, and particularly to the small community among whom his own business lot is cast.

o o o

What sets me on this train is that I went to the dinner of the Process Engravers' Association the other night. Carl Hentschel, one of three who replied to the toast of "The Association." made one of his characteristic outright speeches, the storm centre of which was —"an outburst of amazement that process engravers should in the past have been such idiots."

o o o

To be sure, it has been anything but sanity, and it has in no sense been demanded by printers that engravers should spend their time putting down 6d. and picking up 6d. or 5¾d. A good many of them don't. The craft is doing better on the whole. On the other hand, a good many appear to have been little wiser than this, and it passes comprehension as to why they should act in this way when foreign competition can practically be left out of account, owing to the nature of the work; and at home the making of an engraved plate is so highly technical, comes so near to the nature of a learned profession, that it is difficult for a printer, merely as printer, successfully to add a studio to his business.

o o o

If you come to think of it, the printers who have installed studios are not very numerous. Many have foundries who would not dream of putting in a process plant. You do no doubt encounter here and there the printer who puts up a small studio, and even a three-colour studio, because of the specialist nature of his own printing work, and the obligation coming upon him every now and again to do that work in out of the way time; but the printing trade in general is not running after the addition of the process studio to its type department.

o o o

Mr. G. W. Jones attended this Engravers Association dinner as a distinguished guest. He certainly is a great printer. I doubt if any man living has done more, and I am not sure that any one man has done quite so much to give an uplift to printing as an art. He was called on for a speech at a moment's notice, and even so, though he protested good humouredly, he did very well, and he incidentally testified that it was really very little concern of the printer what engravers charged, within reason, so long as they charged alike for like service.

o o o

Engravers undoubtedly have been foolish in the past. I have been somewhat behind the scenes and claim to know fairly well what a half-tone plate costs per square inch, and, believing myself to be correctly informed, I will engage to say that some prices which have been offered now and again by circular to the public are prices at which profitable business could not be maintained.

o o o

They were about as sensible as the act of the printer cited by Mr. Hazell at the Printers Costing Congress, who said, "I pay my compositor 8½d. an hour, I allow ½d. for my costs, and so my composition costs me 9d. an hour." Whereas, if he was a London printer his composition was probably costing him more like 1s. 9d. per hour.

o o o

Cheapening engraved plates unduly is nobody's gain. I have said before I will admit, but it is worth repeating, that an error in platemaking has this character distinctive from some other classes of error—it cannot be put right. Green paper you can mature. Ink of wrong tone or strength can be doctored; impression can be adjusted; men or machines can be changed (I am not thinking of dismissal but the better fitting of men to jobs). Temperatures being altered may ease things a good deal; intelligence has various chances with these and other factors.

o o o

But what can you do if the plate is wrong? How can you bring up "the work" if "the work" simply is not there?

o o o

How can the studio provide its operator with the very best apparatus, and the operator get from his apparatus the very best results if funds and time do not permit? How can time permit unless the charge permits?

o o o

We come back to the personal equation, to the exercise of common sense. We come back, in other words, to Mr. Carl Hentschel's outburst of amazement that in a craft like this, men should have been such idiots.

o o o

It was so good-humouredly spoken that, for all its intensity, it was not in the least taken amiss. The company recognised that he had the right to speak, for long years ago he put his shoulder to the engraving reform business with that tremendous energy which is the amazement of Fleet-street and is, I think, a guarantee that the best Hentschel days are before and not behind.

o o o

He virtually founded the Process Engravers' Association, and served as its president until other calls on his time made that too difficult, and Mr. Arthur Cox, of Birmingham, succeeded him.

o o o

At that dinner I must say that the Association showed itself in dead earnest. The gathering was the largest I remember. It was, too, the jolliest; the idiot episode detracting nothing from but rather intensifying the fun.

o o o

An engravers' costing convention was foreshadowed as likely to be held during the current official year, or, at any rate, pretty soon. If so, the parallel with the printing happening will not be exact, for a special system of costing for engravers has already been worked out and it is supplied to all members of the Association.

o o o

It is the result of a great amount of very careful observation, and the engravers' costing convention, if held, as I can hardly doubt it will be, will probably first of all receive reports upon the outworking of the system as now already installed in various offices.

o o o

There will, however, be plenty of material for the congress. I have already heard of the engraver who has examined the official costing system, but concludes on the whole to retain his own, and the point will naturally arise as to whether something more can be done towards uniformity in costing.

FRANK COLEBROOK.

DURING February 6 tons of type were imported into the United Kingdom, compared with 3 tons for the corresponding month last year and 1911. The total imports for January and February reach 11 tons, an increase of 7 tons over January and February, 1912, and one ton over the same period of 1911. Turning to the export trade, 42 tons were shipped in February, compared with 29 for the same month in 1912, and 40 tons during February, 1911. The total for the two months reaches 90 tons, an increase of 2 tons over the corresponding period of 1912, and 14 tons over the same period in 1911.

Machine Rulers, Bookbinders, Printers, and Kindred Trades Overseers' Association.

Nearly three hundred members and friends of the above Association assembled in the large hall of the Salisbury Hotel, Salisbury-square, Fleet-street, E.C., for the annual Bohemian concert, when a splendid programme was presented by the stewards, Messrs. J. E. Dixon, E. J. Tierney and A. H. Warner. The chair was occupied during the evening by the President, Mr. J. E. Dixon, and vice-President, Mr. J. Walker, supported by Mr. A. E. Clifford, hon. solicitor, and other friends.

Mr. Harold J. Dwyer presided at the piano in his usual talented manner. Miss Winnie May was in fine voice with "My Hero," and "I don't care what becomes of me." Mr. A. W. Willmott, tenor of the National Sunday League Concerts, was warmly encored for his rendering of "Watch with me o'er to-night" and "Dear heart of mine." "Virto," the popular and versatile instrumentalist, repeatedly encored for his selections on the cornet, post horn, flageolet, English concertina, etc., responded with some very humorous and original stories. Len and Albert ("The Happy Pair") were in very happy mood indeed, and delighted the audience with their versatility in the "Bugle Call," etc., and fully justified their rapidly increasing popularity. Mr. Will Ellis, always popular at these concerts, was very effective in his rendering of "The Night Watchman's Story" and "The Light shone brightly in the Lighthouse," and by special request gave as an encore his highly humorous "Insurance Policy," whilst others specially deserving of mention were Mr. Stanley Collins, sleight of hand; Austin White, humorous; John Dan, female impersonator; Bertram Lewis, sentimentalist.

Great credit is due to the stewards for the great success of the concert. The social gatherings of this Association have always been very successful, but on this occasion the high watermark was reached, and the stewards thoroughly deserved the vote of thanks proposed by the late President, and carried with acclamation by the audience.

The catering at the "Salisbury" having given so much satisfaction, the committee have decided to hold the annual dinner at the same hotel, on Saturday, April 19th, when a large muster is anticipated.

H.M. Stationery Office.

Contracts Made in February.

Binding 2,000 Note Books; printing, binding, etc., 2,000 Lineman's Visit Book; printing, binding, etc., 1,000 Delivery Note Book; printing, binding, etc., 2,500 Redirection Books; printing, binding, etc., 2,000 Memo. Paper Fasteners.—H. Hipkiss and Co., Ltd., Goodman-street Works, Birmingham.

Pins.—J. Edelsten and Son, Warrington.

The Ulster Press Dinner.

Great Gathering in Belfast.

The Ulster Press dinner, organised by a Joint Committee of the Institute of Journalists and the National Union of Journalists, was held in Thomson's Restaurant, Donegall-place, Belfast, on Saturday evening last. Including guests, the gathering numbered close on a hundred, and was of a thoroughly representative character. The menu card took the form of a miniature newspaper, topically illustrated with poetry, prose and portraits, whilst an unofficial musical programme, sparkling with an association of ideas caricatured the idiosyncrasies of well-known Press men, produced a pleasant surprise, as well as a feast of genuine gaiety. Mr. A. W. Stewart, vice-president of the Institute of Journalists, occupied the chair.

The toast of "The Newspaper Press" was given by Sir Robert Kennedy, who said that: "The production of a modern newspaper is a stupendous work—how stupendous the reader of it at his early breakfast rarely stops to consider. A web of paper several miles long is in the space of an hour printed, folded, cut, and delivered into 40,000 or 50,000 perfected broadsheets. The machinery is marvellous, but what about the organisation and the brain work required in a large newspaper office? Important telegrams incessantly pour in from every important city of Europe, Asia, America and Australia; every mail brings batches of full and interesting letters from 'our own correspondents' at home and abroad. Everything has to be read, digested, and placed in proper form day by day with unfailing regularity, and, at the same high standard of pressure and efficiency before an avariciously inquisitive public. The editors and managers and their respective staffs must, indeed, be endowed with more than ordinary mental gifts, with great sagacity, with high culture, and unwearing industry, in order to maintain that splendid reputation which has deservedly won for the Press of England the proud title of the Fourth Estate of the Realm." Sir Robert went on to eulogise the work of newspaper men in the course of a long address of a most interesting character.

Mr. E. G. Robinson also spoke in acknowledgment of the toast, and said in all his journalistic experience he had never seen a more representative gathering than that assembled round their festive board that evening. He had heard it said, adopting the old German proverb, that the mill of the Press grinds slowly, but it grinds exceeding small. Looking round at his many old friends that night, he could only conclude that they must have either discovered some unsuspected soft places in the mill stones or have dodged them altogether. There was a splended collection of young men present, who promised to do infinite credit to the profession, and he thought they would be disposed to acknowledge, having regard to the presence of so many young youthful seniors, that Belfast was not too unkind to its journalists, though possibly it might be a little kinder. It was to the initiative of their admirable chairman that they were indebted for that united assemblage of journalists. The idea came from him, and was hailed with unanimous enthusiasm. Mr. Stewart had established a splendid precedent, and he hoped the Ulster Press dinner would be an annual event.

In a felicitous speech, the toast of "Our Guests" was proposed by Mr. A. M'Monagle, the sentiment being responded to by Chevalier Burke, Mr. Dalziel, and Mr. W. A. Bell.

The proceedings were varied by a delightful musical programme, and the proceedings terminated with the singing of the National Anthem and "Auld Lang Syne."

LEATHER PAPERS

Trade Notes.

THE London offices of Messrs. Taylor, Garnett, Evans and Co., Ltd., have been removed to Thanet House, 231-232, Strand, W.C.

LORD ALDENHAM has made a further contribution of ten guineas to the Printers' Pension, Almshouse and Orphan Asylum Corporation.

THE Blackfriars Type Foundry announces that owing to the great rise in the prices of metals, the prices for type are now increased as shown in a price list that accompanies the notice.

THE Sudan Government invite tenders, up to May 10th, for stationery. Samples and particulars may be seen at the office of Sir A. L. Webb, K.C.M.G., Queen Anne's-chambers, Broadway, Westminster, S.W.

ACCORDING to *Kemp's Mercantile Gazette* there was only one failure in the printing and stationery trades of England and Wales for the week ending Friday, March 21st; the corresponding week in 1912 also showed one.

A PHOTOGRAPHIC ARTS AND CRAFTS EXHIBITION will be held at the Royal Horticultural Hall, Westminster, from the 4th to the 12th April next. The Mayor of Westminster, Alderman H. Lyon Thomson, will perform the opening ceremony.

MR. FRANK A. MUNSEY has sold the *Boston Journal* to Matthew Hale, national committeeman of Massachusetts and State chairman of the Progressive party. The price of the paper has been again fixed at one cent. Mr. Munsey had raised it to three cents.

BY a fire that broke out on Monday morning in Harp-alley, Farringdon-street, E.C., considerable damage was done to a four-storey building occupied by the Premier Publishing Co., and other firms. During the work of extinguishing the flames two firemen fell through a skylight and were injured.

WE would remind our readers that the annual dinner of the Machine Rulers, Bookbinders, Printers and Kindred Trades Overseers' Association will be held at the Salisbury Hotel, Salisbury-square, E.C., on Saturday, April 19th, next. Tickets may be had from the secretary, Mr. George A. Eden, 9, Murillo-road, Lee, S.E.

MR. HARRY BRITTAIN, representative in America of the British Committee for the celebration of the hundredth anniversary of peace among English-speaking peoples, is endeavouring to arrange for an exchange of visits between leading American and British newspaper proprietors and journalists previous to the celebration.

IN the "Buyers' Guide" of our Special Export issue, dated March 29th, 1913, we referred to Mr. William J. Light, 127, Fenchurch-street, London, E.C., as the supplier of "Tindeck" Press Blankets. We regret this was incorrect. Mr. Light is not interested in "Tindeck," but is the British agent for "Everwear" Press Rubbers, a very excellent material.

TENDERS WANTED.—For the King Edward School, Chelmsford, for the supply of books, stationery, etc. Forms of tender from Mr. W. Stunt, 71, Duke-street, Chelmsford.—For the supply of stationery to the Hampton Urban District Council. Particulars from Mr. E. Cozens, Public Offices, Hampton, Middlesex. —For printing and supply of account books for the Corporation of Gateshead. Forms of tender from Mr. F. Winter, Town Hall-buildings, Gateshead.

AT the final sitting of the annual delegate meeting of the National Union of Journalists, held in Manchester on Saturday, Mr. W. T. A. Beare (London) was elected the new president of the Union. Mr. F. E. Hamer was elected vice-president, and the following officers were re-elected:—Mr. W. N. Watts, honorary general secretary; Mr. G. H. Letham, honorary treasurer; and Mr. W. Meakin, honorary unemployment secretary. It was decided that the next meeting of the Union should be held in Liverpool.

IN our issue of the 13th there appeared a company notice headed "*English Review*, Ltd., in Voluntary Liquidation." We would ask our readers to note that the company referred to has nothing whatever to do with the *English Review* as it now exists. The *English Review*, Ltd., which is in liquidation is the old company from whom the present proprietors acquired the *English Review*. The present company is styled "The *English Review* (1911), Ltd." and we understand that it is doing exceedingly well.

BOOK-READING.—Two diagrams, compiled by Mr. F. E. Woodward, of Washington enable a comparison to be made between the number and kinds of books published in 1890 and in 1912 in the United States. In 1890 the population of the United States was over 62,000,000; in 1912 it must have been rather more than half as many again. The number of books published, however, has more than doubled, for they were 4,559 in 1890 and 10,135 in 1912. Fewer novels were published in 1912 than in 1890, and the number of novels in the books published dropped from 24½ per cent. to 9 3-10 per cent.

THE late Mr. J. W. Arrowsmith, printer and publisher, of Bristol, has left estate of the value of £55,776.

TENDERS are wanted for the supply of stationery, printing, etc., for the Great Northern Railway of Ireland. Forms of tender from Mr. T. Morrison, Amiens-street Terminus, Dublin. The Corporation of Glasgow invites tenders for supplies of stationery, of which particulars may be had at 46, Bath-street, Glasgow.

THE "Cobalt Mining Manual" (by H. Burges Watson) has just been published by Messrs. Straker Brothers, Ltd., 61, Old Broad-street, E.C. It contains particulars of the many silver mining companies in the Cobalt territory, and gives much valuable information as to their position and prospects. The price is one shilling.

THE Institute of Printers and Kindred Trades' thirteenth annual dinner is announced for Tuesday, April 8th, and will be held at the Connaught Rooms, Great Queen-street, W.C., under the chairmanship of the President, Sir George Riddell (*News of the World*), supported by Sir George Reid, G.C.M.G., K.C. (High Commissioner for Australia), Col. the Hon. Harry Lawson, M.P. (Past President of the Institute), Capt. the Hon. Bertrand Russell, Sir Rowland Bailey, C.B., M.V.O., I.S.O. (Controller H.M. Printing Office), Sir William Robertson Nicol, Mr. T. P. O'Connor, M.P., Mr. Anthony Hope Hawkins (Past President of the Institute), His Honour Judge Rentoul, K.C., Mr. J. J. Keliher (Past President, Master Printers' Association), Mr. H. C. Cottle, Government Printer, Colombo), etc., etc. A musical programme of a special character is being arranged. Last year the new arrangement of giving members a free non-transferable ticket proved so successful that it is to be repeated this year.

AN echo of the "Titanic" disaster was heard, the other day, at the Colne County Court, when George Sutherland, printer, of Wigan, sued the Midland Railway Company for £9 5s. damages for loss sustained by him through not obtaining three parcels on the production of his ticket of deposit in the cloak-room at Colne on May 18th last. Mr F. C. Peers, for the plaintiff, stated that May 19th was the day of the funeral of Wallace Hartley, the "Titanic" band conductor, at Colne. On the Friday, plaintiff deposited at the railway station a quantity of memorial cards of the deceased and pictures of the "Titanic," which he had on order to supply to the newsagents and sell at the funeral. Later in the day, he called for the goods, and produced his deposit ticket. Then he was told that by a mistake the pictures had been put on a train to Accrington. Plaintiff waited on the platform for the goods to return on the Accrington trains till 10 p.m., but they did not turn up, and though they came on the morning of the funeral they were of no use to him then, and he refused them. The pictures cost him £7 5s., and he estimated he could have made a profit on them of about £2 10s. His Honour gave judgment for the plaintiff for £7 5s.

TENDERS ACCEPTED.—For printing for the Corporation of Southend-on-Sea, Messrs. Francis and Sons, 69, High-street, Southend. For a supply of stationery for the Westminster City Council, Messrs. Wightman and Co., Ltd. For printing and stationery for the Newark Guardians, H. S. Whiles, Stodman-street, Newark. For printing and stationery for Whitehaven Town Council, Messrs. Brackenridge and Co., Ltd. For election printing for Worcester Town Council, Messrs. Littlebury and Co. For a supply of stationery and printing to the Guardians of the City of London Union, Messrs. Truscott and Co. For the supply of various papers for the London County Council, Messrs. Millington and Sons (1908), Ltd., 32, Budge-row, E.C. For the supply of school materials for the Croydon Education Committee the following tenders are recommended for acceptance:—Books, apparatus and stationery, E. J. Arnold and Son, Ltd., Leeds; Educational Supply Association, Ltd., London; Philip and Tacey, Ltd., London; J. Marshall and Co., London. Drawing materials, etc., Reeves and Sons, Ltd. Kindergarten materials, Educational Supply Association, Ltd., London; Philip, and Tacey, Ltd., London; Charles and Dible London; E. J. Arnold and Son, Ltd., Leeds.

THE annual dinner on behalf of the funds of the Readers' Pensions Committee will be held on Saturday, May 3rd (*not* the 30th, as announced in our issue of March 13th). The venue is cast for the Venetian Chamber, Holborn Restaurant, and Sir Henry Lucy ("Toby, M.P." of *Punch*) will preside. Particulars will gladly be supplied by Mr. W. H. Shortell, hon. secretary, St. Bride Institute, Bride-lane, E.C.

"SOME Linotype Faces for Book Printing" is the title of a specimen book of matrices that can be supplied to the Linotype user by Messrs. Linotype and Machinery, Ltd. The examples show an excellent variety, including old style, modern, Ronaldson, Cheltenham and other faces, and the pages have been set with the new double-letter matrices that enable roman characters with small caps and italics to be operated from one keyboard. The selection offers almost every variety of type face that the book printer can want and the printed examples are all that could be desired.

THE result has been announced in Glasgow of the ballot taken in the 36 branches of the Scottish Typographical Association on the proposed agreement between the employers as represented by the Scottish Alliance of Masters in the Printing and Kindred Trades, and the Edinburgh and Glasgow Master Printers' Associations on the one hand, the Scottish Typographical Association and its Edinburgh and Glasgow branches on the other. The ballot has resulted as follows:—In support of the proposed agreement, 2,470; against the proposed agreement, 638. The vote represents about two-thirds of the total membership.

MESSRS JOHN HADDON AND CO., Salisbury-square, E.C., are offering a new folding machine called the "Omaha," which has been specially designed for direct coupling to machines of the Babcock Standard type. It is quite a portable machine, and may be wheeled into the position usually occupied by the delivery table, where it may be connected up ready for work in two minutes. When the folder is attached to the press, the ordinary flyer fan is disconnected and the sheets are passed from the delivery drum on the press, direct into the folder. The "Omaha" folder is a very profitable proposition, since its use eliminates all cost and delays incidental to handling, and at the same time effects a very considerable saving of time. The folder is not designed for folding high-class work, but is intended to handle newspaper and magazine folding, or work of a similar character, and is not an expensive machine. It can be seen at work at Messrs. Haddon's Model Printing office by appointment.

THE LATEST POST CARDS.—Another new series of picture post cards has been published by Messrs. Raphael Tuck and Sons, Ltd., reproduced in their "Oilette" and other processes, and a large sale will certainly be assured for such admirable productions. The inimitable humorous cat studies by Louis Wain are represented in two packets showing his work at its best, the cats being depicted "Taking the Waters," and are most clever caricatures of the frequenters of our watering spas. "Tales of the Seaside" is another clever series of humorous cats which will be in demand directly the seaside holiday season begins. Messrs. Tuck's flower studies are remarkable for their artistic charm and wide range, and will appeal to every refined taste. "Carnations," a realistic set of studies in vases, beautifully reproduced, is a charming addition that will increase the popularity of the large collection. Studies of children is another extensive series, and "Young Hearts" (little folks quaintly portrayed in pretty colour effects), and "Rose Buds" (beautifully coloured pictures of children's heads reproduced in the "Rapholette Glosso" process) are capital examples. "My Lady," the title of six oval head studies, reproduced in the "Oilette Connoisseur" process with tinted border, and "Queen of Roses," photographic studies of a pretty girl with clusters of roses, are sure to be appreciated, as will also "Heroes of the South Pole," a chaste emblematic design in colours to honour the memory of the heroes who lost their lives in the Scott Antarctic Expedition.

IT is the opinion of the *Printing Trade News* that there should be an agreement arranged between the press manufacturers, cutting machine makers, and bindery machine builders that every machine replaced by a new one shall be broken up for scrap. The Club of Printing Machinery Manufacturers being organised in New York at this time, might well be asked to take this matter up as the first order of business when fully organised.

THE GERMAN PRESS.—Mr. Price Collier, writing in *Scribner's Magazine* on "German Political Parties and the Press," points out that there are some 4,000 daily and more than 3,000 weekly and monthly publications in Germany to-day, as compared with 22,806 newspapers published in America, 9,500 in England, 8,049 in Germany, and 6,087 in France;

Digitized by Google

or one for every 4,100 of the population in America, one for every 4,700 in Great Britain, one for every 7,800 in Germany, and one for every 5,900 in France. Neither the German press as a whole nor the journalists, with a few exceptions, he says, exert the influence in either society or politics of the press in America and in England, and the character of the men who take up the profession of journalism suffers, perhaps, from the lack of distinction and influence of their task. Of the *Vorwarts*, the organ of the Socialists, Mr. Collier says that whatever one may think of its politics it is one of the best edited, as it is one of the best written, newspapers in Germany. The *Lokalanzeiger* and the *Tageblatt* of Berlin attempt, with no small degree of success, American methods, and give out several editions a day, with particular reference to the latest news. The *Berliner Tageblatt*, in a recent issue, declares its paid circulation to have been 73,000 in 1901, 106,000 in 1905, 190,000 in 1910, and 208,000 in 1911.

The first grand Bohemian Concert by the Associated Singers, a talented body of vocalists engaged at the various establishments run by Messrs. Harmsworth (such as Carmelite House, the Amalgamated Press, etc.) promises to be a gigantic affair. The programme contains some seventy names, and includes some of the most popular music hall and concert artists. The date is fixed for Saturday, April 5th, at the Holborn Hall, Grays-inn-road, and Mr. C. W. Bowerman, M.P., is to preside, the proceeds being devoted to the funds of the Printers' Medical Aid and Sanatoria Association, of which he is president, and which is claimed to be the only institution connected with the printing industry that supplies its members with free surgical appliances, such as spectacles, trusses, elastic stockings, etc., special hospital letters, convalescent homes, both inland and seaside, sanatoria treatment, etc., all of which are issued in a manner entirely devoid of red tape methods. This concert should certainly give an impetus to the useful work of this association. Applications for tickets should be made to the secretary of the Association. Mr. Arthur O'Connor, hon. sec., The Associated Singers, Carmelite House, E.C.

Mr. Arthur Dawson.

The interment took place at the Otley Cemetery, on Saturday afternoon, of the remains of Mr. Arthur Dawson, whose death took place the previous Wednesday at the comparatively early age of 43. Mr. Dawson was the elder son of the late Mr. Jeremiah Dawson, of Otley, and a grandson of the late Mr. William Dawson, who was the founder of the printing machine trade in Otley, and who established the firm of Messrs. Wm. Dawson and Sons, Ltd. Mr. Arthur Dawson served his apprenticeship at the Ashfield Foundry, where he remained until he was about 30 years of age, when he entered into partnership with Mr. Amos Holmes, an Otley gentleman, as printers' engineers, at Birmingham. Owing to ill-health, Mr. Dawson relinquished his connection with that firm at the end of about two years, and he returned to his native town. In 1902 he joined the firm of Messrs. Elliott and Co., Ltd., with whom he remained until 1910, when he entered into partnership with the firm of Messrs. Dawson and Nancarrow, printers' engineers, Birmingham. Failing health, however, subsequently necessitated entire retirement from business. He was a member of the Royal Wharfedale Lodge of Freemasons, and at one time occupied the chair of Worshipful Master. The interment on Saturday, which was conducted by the Rev. R. Pattinson (Vicar of Otley), assisted by Mr. T. Smith (lay reader), was largely attended. The chief mourners were Mrs. A. Dawson (widow), Miss Ethel Dawson (sister), and Mr. F. C. Dawson (brother). Messrs. R. Elliott and Co. were represented by Mr. R. Elliott and several workmen, Messrs. Wm. Dawson and Sons by Mr. J. Mason, and Messrs Fieldhouse, Crossfield and Co. by Mr. H. Fieldhouse, and the members of the Royal Wharfedale Lodge of Freemasons also attended.

The death is announced of Mr. Robert Holden, chief reporter of the *Ormskirk Advertiser*, at the age of forty-one. He had been connected with one office since his boyhood, and had occupied the senior position on the staff for sixteen years.

The death has occurred at Weymouth of Mr. Francis George Heath. He was the author of many books dealing with rural subjects, and for two years edited the *Journal of Forestry*. He also wrote several books on ferns.

NEW COMPANIES.

Sheratons, Ltd.—Registered on March 14th, with a capital of £3,000, in £1 (10 founders), to carry on the business of advertising contractors, billposters, manufacturers' agents, etc., and to adopt an agreement between A. Adams and A. H. Male. The subscribers are A. Adams and A. H. Male. Private Co.—the number of directors is not to be less than two nor more than five; the first are R. W. Adam, F. C. Moss, A. Adams and A. H. Male (all permanent subject to holding 100 shares). Remuneration as fixed by the company. Registered office: 170, Strand, W.C.

Marten and Son, Ltd.—Registered on March 14th, with a capital of £3,000, in £10 shares, to take over the business carried on at 17, Market-hill, Sudbury, Suffolk, as Marten and Son, and to carry on the business of printers, stationers, booksellers, dealers in fancy goods, etc. The subscribers are B. R. Marten and R. H. Marten. Private Co.—the number of directors is not to be less than two nor more than five; the first are B. R. Marten and R. H. Marten, each of whom may retain office while holding £100 shares, Solicitor, G. L. Andrewes, Sudbury, Suffolk. Registered by Waterlow Bros. and Layton, Ltd., Birchin-lane, E.C.

A. and C. Knight, Ltd.—Registered on March 13th, with a capital of £1,500, in £1 shares (500 preference), to carry on the business of manufacturers and vendors of paper and fancy boxes, etc., to acquire the business carried on at 5, Hockley-street, Birmingham, as A. and C. Knight. The subscribers are Florence Hope and O. E. Harding. Private company. The directors are to number not more than five; the first are to be appointed by the company. Registered office, 37, Temple-street, Birmingham.

Anglo-Bohemian Industry, Ltd.—Registered March 18th, by Vallance and Co., 28, Bishopsgate, E.C. Capital, £200,000, in £1 shares, to acquire and take over as going concerns all the property and interests in and the businesses (1) carried on by Josef Geller von Kuehlwetter in partnership with Comte de Merveldt, of graphite miners and refiners, and (2) carried on by the said Josef Geller von Kuehlwetter in partnership with Johann Hanrieder, as proprietors of the industrial undertaking known as "Triumph," as well as various other properties and concessions relating to the said businesses, to acquire any coal-bearing lands in Bohemia or elsewhere, and to carry on the business of ironmasters, steel makers and converters, colliery proprietors, coke manufacturers, miners, smelters, engineers, tinplate makers, founders, refiners of and dealers in graphite and other mineral products of similar kind at the graphite refinery at Kollowith (Bohemia). The signatories are:—E. F. Ashman, J. H. Howard, J. Bannister, J. Dare, H. Romain, K. Dobner, and S. F. Gooderham. Minimum cash subscription, seven shares. The first directors (to be not less than two nor more than 12) are:—Lord Teynham, 30, Lowndes-street, S.W.; Sir W. F. Haynes-Smith, K.C.M.G., 26, Chester-terrace, Regent's Park; Max Baron de Wendland, Bernreid Castle, Bavaria; F. F. von Hildprandt, Blatua, Bohmen; and J. G. von Kuehlwetter.

A varied and attractive selection of stories by famous novelists, valuable articles by writers of authority on their respective themes, and entertaining features in lighter vein, are to be found in the April number of the *Windsor Magazine*. Prominent among the articles is one entitled "The Edge of an Empire," from the pen of Edwin Lester Arnold, and Charles G. D. Roberts contributes a further Nature article. Among the famous novelists responsible for the fiction of the number are Halliwell Sutcliffe, whose new romance, "The Open Road," is carried a stage further; Justus Miles Forman, who tells the story of the fifth of the famous Gaunt rubies; and the late Robert Barr, whose diverting sequel to the earlier adventures of Young Lord Stranleigh shows no falling off in humour or interest. Among the other complete stories of the number are an ingenious little comedy, by Edmund Bosanquet, and a thrilling drama with a masked burglar for hero, by Rudolph de Cordova. In lighter vein is a whimsical and really entertaining essay by a schoolboy, of the name of Masters, full of ignorantly droll ideas. The fine-art feature consists of a second series of pictures, chosen from those not previously reproduced, by that greatly-popular Victorian artist, Henry Stacy Marks, R.A. A charming coloured plate from one of the most genial of these subjects, "Intellect and Instinct," accompanies this article, reproduced in facsimile from the original in the City Art Gallery of Birmingham.

The Cost of a Cost System.

MANY printers on being approached on the subject of installing a cost system at once begin to inquire what it is going to cost them—what extra assistance they will have to get? A similar inquiry was made at the recent Cost Congress in the Kingsway Hall. In reply, Mr. Howard Hazell, speaking from experience in his own works, and other members of the Costing Committee, said it did not involve much clerical expense; some skilled investigation at first, to arrive at the allocation of general expense, but afterwards it was mere routine. In one of his works they had one lady clerk running all the costing for over 200 people. Bearing on this same point, some interesting remarks were made by Mr. E. E. Salt, who is with the Robert S. Denham Co., the American cost experts, in an address he gave recently before the New York Master Printers' Association. Speaking of the regular clerical routine which he considered was required to properly carry on a method of cost-keeping, he says: "The time necessary for this routine will vary slightly in different shops, but experience shows that in the average printing establishment from three to four minutes per day per employee covers the whole time necessary to keep the records. If you have from thirty to forty employees your cost clerk (and many printers use a bindery girl for this purpose) will take about two hours per day to take care of the records. Then at the end of the month to make up your cost summary the bookkeeper will take three to four hours to collect all the data and properly distribute it and find the hourly cost; so that the expense of running a cost system after it is once installed is as sm all as it is possible to get it, two or possibly three hours per day, according to the ability of the person doing the work, and three or four hours per month of the bookkeeper's time comprise all the work necessary in a printing shop having any number of employees up to forty."

* * *

Better Paper for Reference Copies.

THE importance of printing copies of newspapers that are to be kept for reference is emphasised by the Pennsylvania State Libriarian, who has asked the publishers of 240 newspapers in Pennsylvania to furnish three copies of their issues that are sent to the library for preservation, on linen paper, the reason being that such paper better stands the ravages of time than the wood pulp paper now generally used. The request is the result of a study of the manner in which newspaper files were bearing the passage of time. Some of the old-fashioned rag papers used 100 years ago are declared to be almost as good as new, but the researches are said to have shown the paper commonly employed not to be as well adapted for preservation. Some of the answers received from publishers have cheerfully agreed with the request of the Librarian, and others say they are engaged in study of the subject on their own initiative. The chief objections are that the change of newspaper reels would involve loss of time and also add to expense. The Librarian takes the ground that it is important to preserve the files of newspapers of to-day for the future, saying: "The present owes to the future a daily record of things as they now are."

* * *

The Evil of Cutting Prices.

WE have many times in our columns given the figures for contracts of printing that have been sent into public bodies and other large purchasers of printed matter, and shown what great discrepancies have existed between the prices quoted by the firms tendering; in some instances the lowest tender for certain work being but a fourth of that asked by the highest tender. How comes such a discrepancy? We fear from a desire to get work, whether profitable or not, or to cut out a competitor by taking the job for much less than the cost of the material and labour required. But did ever a printer build up a sound successful business by cutting rates till there was but the smallest margin of profit left? and, in some instances no profit whatever, but a decided loss; we do not know of a single such instance. We do know of firms that have pursued such cut-throat tactics, and were seemingly prosperous for a time, but they came to grief sooner or later, and this must be the common fate of all such unfortunate followers of undercutting. Of course we are not alluding in these remarks to fair competition, for there is such a thing even in these cutting times as honourable competition, and we do not include in these remarks any who compete for work in a straightforward honourable manner, or who make use of their improved machinery and facilities for the cheapening of production. If one man, by better management, can run his office cheaper than another, or has an advantage in buying his material, or makes a speciality of certain classes of work that gives him special advantages over others, then he is quite justified in taklng work at prices which, although seemingly low, are yet profitable to him. But the ordinary cutter does not put in a low price on any such grounds. He simply makes it his custom to follow in the wake of more energetic men than himself, men who have a knowledge of their business, and having got to know the rates they are charging for certain work, he goes for that particular job when next the contract is open. It matters but little what his competitor's price was, he quotes a lower one, and takes the work, if he can get it, at a figure which honourable firms in the trade would not touch it at. Many of these cutting employers will defend their actions by saying that they have a larger turnover of

Digitized by Google

capital during the year than their higher-priced brethren; but what signifies a large turnover if it shows no actual profits, or does not enable the bank balance to increase, as it should, in proportion to the turnover? If you are disposed to cut rates, first count the cost, but better far figure out carefully on the job, and do not take it at all unless it offers a living profit. Once begin to cut prices to your customers and you will have to keep on cutting to keep them, with, in the end, most deplorable results.

* * *

A New Use for a Motor Cycle.

Many have been the mechanical devices utilised when breakdowns have occurred to the engines of newspaper offices, but the first to use a motor cycle is a newspaper in Elgin, Ill. The newspaper printed in this unique manner was the *Elgin Courier*, the electric power drive of the machines having been cut off on account of broken wires caused by a storm. With a motor cycle and a gas engine harnessed to the drive wheel, the *Courier's* big press was started, and an eight-page edition was sent on the streets an hour before the traction company's power came on. The motor cycle was clamped to the press-room floor and connected with the belt-driven trimmer, shaver and router, finished the plates. The edition was cut down, so that only the lower deck of the big perfecting press was used, and then the six horse-power gas engine was harnessed to the press. For the first time since machines were installed the *Courier* resorted to "hand-setting." While in tabloid form the issue covered all the important news events and was composed and printed in the *Courier* plant.

Offset Work in the States.—A correspondent writes that the popularity of offset paper has never been so general in Chicago as at the present time. The larger paper houses that do the majority of this business with lithographers state that a number of local printing houses have been installing offset presses during the last few months. This paper is being adopted quite generally for pamphlet, magazine and catalogue covers. Many concerns that in the past have refrained from using this kind of paper are now using it largely for pamphlets and catalogues, and the satisfaction it is giving could not be greater. The opinion prevails that offset paper will be used almost exclusively for pamphlet work in Chicago in the near future.

Financial.

Offices of the *British and Colonial Printer and Stationer*,

58, Shoe Lane, London, E.C.

Wednesday, March 26th, 1913.

MONEY was in strong demand before the Easter holidays, and on re-opening afterwards the demand continued as keen as ever, rates being maintained at previous high levels. A large business was done at the Bank of England yesterday, mainly in loans at 5½ per cent. Discount rates show no easier tendency. Bullion movements have resulted to date in a net influx of £462,000. Stock markets closed for the holidays last week with a good tendency and resumed work yesterday in an optimistic frame of mind, prices moving upwards in most sections. Consols have improved, the quotations being 74 to 74⅛ for money, and 74 1/16 to 74 3/16 for the account.

Business in the miscellaneous industrial market keeps on a very restricted scale, but the tone is fairly steady. It has been a very short week for business, and our list of shares shows only one movement, a rise, which took place yesterday, in Ilford Ord. of ⅜ to ⅜—⅝. Business has been done in Amalgamated Press Pref. at 21s.; in Associated Newspapers Pref. at 21s.; in *Country Life* Pref. at 16s.; in Ilford Ord. at 13s. 9d., and in the Pref. at 19s.; in *Illustrated London News* and *Sketch* at 14s. 3d., and in the Deb. at 64; in International Linotype at 77; in Linotype and Machinery A Deb. at 58 and 60; in Edward Lloyd Pref. at 22s. 9d., 22s. 6d., 23s. and 22s. 9d.; in Raphael Tuck and Sons Pref. at 5 1/16 and 97s. 3d.; in Weldons Ord. at 33s. 1½d. and 33s. 10½d., and in the Pref. at 19s. 4½d. and 20s. 3d.; and in Wyman and Sons Pref. at 14s. 9d.

DIVIDENDS AND REPORTS.

W. E. Baxter, Ltd.—The 24th annual general meeting of W. E. Baxter, Ltd., printers and publishers, and proprietors of the *Sussex Express*, was held last week. Mr. Cuthbert Hayles, of Rye (chairman of the company) presided. The profit and loss account stood at £1,714 15s., and after paying five per cent. on the preference shares, the directors recommended that a dividend of four per cent. (free of income tax) be paid on the ordinary shares. The chairman, in moving the adoption of the report and accounts, remarked that they had maintained the dividend, and the position of the company was altogether very much better than it used to be. Mr. Gearing seconded, and said it was satisfactory to know that the dividend was the same. The report and accounts were adopted.

Winterbottom Book Cloth Co., Ltd.—The report of the Winterbottom Book Cloth Co., Ltd., for 1912, states that the accounts show a net profit, including £10,156 brought forward, of £210,182, and, after payment of directors' fees and interest on the debenture stock and making donation to workpeople's benefit fund, there remains a balance of £180,758, which the directors propose shall be appropriated as follows, namely:—To preference shares: Interim dividend at 3 per cent. to June 30th, 1912, £10,997; dividend at 3 per cent. for six months ended December 31st, £10,997. To ordinary shares: Interim dividend to June 30th, at 10 per cent. per annum, free of income tax, £19,962; dividend 15s. per share for the six months ended December 31st and bonus of 15s. per share, both free of income tax, £59,886. To write down investments, £5,000; to depreciation fund, £20,000; to reserve fund, £40,000; to carry forward, £13,915.

COMPANY MORTGAGES AND CHARGES.

Fresh Obligations registered pursuant to Section 10 of the Companies Act, 1907, and Satisfaction registered pursuant to Section 16 of the Companies Act, 1900. (The registration of Satisfaction is not compulsory.)

Charles Bevan, Ltd.—Second debenture, dated March 6th, 1913, to secure £400, charged on the company's undertaking and property, present and future, including uncalled capital. Holder—P. E. Dewey, Royden, Essex.

Jockey, Ltd.—Assignment by way of mortgage, dated March 8th, 1913, to secure £539 9s. 4d., charged on company's interest in the publication, "Form in a Nutshell Annual, 1912." Holders—Jordan-Gaskell, Ltd., St. Bride's House, Dean-street, Fetter-lane, E.C.

W. J. May and Co., Ltd.—Particulars of £5,000 debentures, created by resolutions of December 20th, 1912, and February 19th, 1913, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the amount of the present issue being £1,000. Property charged—the company's undertaking and property, including uncalled capital. No trustees. A memorandum of satisfaction to the extent of £300 on May 31st, 1912, of debenture dated December 17th, 1909, securing £1,500 has also been notified.

Wyman and Sons, Ltd.—Mortgage, dated December 31st, 1912, as collateral security for £10,000 five per cent. first mortgage debenture stock, forming part of stock secured by trust deed dated November 24th, 1893, charged on a sinking fund policy. Holders—Phœnix Assurance Co., Ltd., 19, Lombard-street, E.C. (Registered March 13th, 1913, pursuant to order of Court.)

Herbert Fitch and Co., Ltd.—Land registry charge on 31-5, Mansell-street, E.C., dated February 28th, 1913, to secure £3,500. Holder—H. J. Fitch, 28, Redcliffe-garden, Kensington.

Keighley Free Press Co., Ltd.—A notice of the appointment of H. M. Baggs, of Arcade-chambers, North-street, Keighley, as receiver on March 10th, 1913, under powers contained in first mortgage debentures dated May 24th, 1912, filed pursuant to Section 94 of the Companies (Consolidation) Act, 1908.

COMMERCIAL INTELLIGENCE.

Re GUSTAV HERZ,
Picture Post Cards and Trade Labels.

Under the failure of this debtor, who carried on business at 25a, Hatton-garden, E.C., accounts have been lodged at the London Bankruptcy Court showing total liabilities £5,385 11s. 3d. (unsecured £5,350 11s. 3d.), and net assets valued at £573 0s. 5d. According to the observations of the official receiver and the debtor's statements, he came to London from Berlin in August, 1899, and in the following January commenced business as a fancy jewellery factor at Featherstone-buildings, Holborn, removing in June, 1900, to 90, Hatton-garden. In March, 1905, he took over the business of a picture post card publisher at Woodford, the arrangement, a verbal one, being that he should employ the previous owner to manage the business, which was removed to his Hatton-garden premises. In July, 1905, he removed both businesses to 25a, Hatton-garden, but in December, 1907, the manager of the picture post card business left him, and since July, 1909, the debtor has only executed a few orders for post cards. In January, 1908, he took over the business of a manufacturer of trade labels, carried on at Hackney under the style of the Brandon Label Co., a verbal arrangement being that he should employ the previous owner to manage the business, which he continued under the old style at his Hatton-garden premises and the residence of his manager in Hackney until January, 1909, and then closed it. The debtor attributes his failure and insolvency to losses by bad debts and in connection with the post card and label businesses; to loss on Stock Exchange speculations, and to heavy expenses consequent upon the illness of his wife and child. The public examination of the debtor was to have been held on the 13th inst., but was adjourned upon the application of the official receiver to enable the debtor to furnish further accounts.

THE CROYDON and COUNTY NEWSPAPERS, LTD.

A meeting of creditors of the Croydon and County Newspapers, Ltd., now in voluntary liquidation, was held at the offices of the liquidator, Mr. James E. Ward, 44, Bedford-row, W.C., the other day. Mr. Goodman, who presided, said, as the creditors were aware, Mr. Ward had been appointed liquidator of the company by the shareholders, and that meeting had been called in compliance with the Companies Acts, in order to lay the position of affairs before the creditors. Mr. Ward was himself a creditor for more than £100; therefore, it would be to his interest to get as much as he could for the creditors, but unfortunately he was afraid there would be very little for anybody outside the debenture holders, so far as he could see at present. It would be within their recollection that a petition was placed on the file by Messrs. Guppy and Son for the compulsory winding-up of the company, but in view of the resolution passed by the shareholders for the voluntary winding-up, the compulsory order was not obtained. The only chance of the creditors receiving anything would be in the event of their being able to upset some of the debentures, and he could assure the meeting that if they decided to continue Mr. Ward as liquidator the debentures would be very carefully looked into, and, if necessary, counsel's opinion taken if there was the slightest likelihood of getting anything. As soon as Mr. Ward was appointed liquidator he wrote to the receiver asking him for particulars of his realisation and transactions in connection with the company. A creditor asked if the receiver was in possession under an order of the Court, or as mortgagee. Mr. Goodman said the receiver had been appointed under the Conveyancing Act, under the powers contained in the debenture deed, and not by order of the Court. In reply to another creditor, he said he believed there were debentures amounting to £6,000, of which £5,000 was the original debenture, and £1,000 was given in regard to subsequent loans. Mr. Goodman, continuing, said:—In reply to Mr. Ward's letter, a communication was received from the solicitors to the receiver, in which they stated that the receiver had been appointed under an instrument in writing. They further stated that the receiver had received an offer of £6,250 for the business, as and from the date of his appointment, and he had accepted that, subject to a formal contract being entered into. In reply to that, Mr. Ward asked whether the offer of £6,250 had been received at public auction or by public tender. The solicitors to the receiver, in answer, said they obtained offers for the business from everybody they thought would be likely to purchase, and that was the highest bid they could obtain. With regard to the account asked for by Mr. Ward, as the receiver was carrying on the business for the benefit of the purchaser, he would have to render his account to the purchaser, owing to the fact that he had sold the business as and from the date of his appointment. A creditor said that so far as they were concerned the business had already been sold for £6,250, and for all they knew, it might have been sold to one of the debenture holders, or a shareholder of the company. He should like to know if they could ask for the name of the purchaser. Mr. Goodman said if Mr. Ward were appointed liquidator he would no doubt in time be able to ascertain who had purchased the business, but at present he was quite in the dark. They had the definite statement that the business had been sold as and from the appointment of the receiver, and as the receiver was appointed as far back as November 18th last, they would be able to appreciate how the matter stood. In reply to a creditor, Mr. Goodman said he understood that the Rev. R. A. White was a debenture holder for £5,000, and he believed Mr. Miller held another debenture for £500, and Sir Fredk. Bridge another for £500, making £6,000 in all. He believed that the £5,000 debenture was port of the purchase consideration of the business, and the other £1,000 was in respect of cash advanced since. With regard to the application of Messrs. Guppy for a compulsory winding-up order, they no doubt found that nothing would be gained by compulsory liquidation, so they allowed the matter to drop. Messrs. Guppy and Son were creditors for about £250, and no doubt they were the

Digitized by Google

largest creditors. He had not prepared a statement of affairs, as they had no funds in hand for that purpose. Whoever was appointed liquidator at that meeting would not obtain a very profitable appointment, unless of course the debentures could be upset. In reply to further questions, Mr. Goodman said he understood the directors of the company were Mr. White, Mr. Auld, Mr. James, and Mr. Cole. He was afraid that the £6,250 for which the paper had been sold would only be just sufficient to pay off the debentures, and the expenses of the receiver, etc. The receiver, of course, would be liable for any debts contracted on and after November 18th last, the date of his appointment. After further discussion, it was decided that the liquidation should be left in the hands of Mr. Ward, and the meeting was brought to a close.

Re WM. HENRY BUCHANAN, Manufacturing Stationer.

The official receiver for the Wandsworth district has now issued his observations under the failure of this debtor, described as of 4, Lessar-avenue, Clapham Common, S.W., manufacturing stationer, lately carrying on business in Sun-street, Finsbury. The statement of affairs filed by debtor disclosed gross liabilities of £2,405, of which only £311 was expected to rank, there being fully secured creditors for £383 11s. 8d., holding securities of £435, and in addition there were contingent and other liabilities of £1,990, of which only £290 was expected to rank. The assets were returned at £42 2s. 10d., after deducting the claims of preferential creditors, thus showing a deficiency of £269 3s. 6d. The cause of failure as alleged by debtor is, "The failure of C. Modena and Co., Ltd., who took over my business." The report and observations are to the following effect:—The receiving order was made on the petition of a creditor, the act of banruptcy being the failure of the debtor to comply before December 28th, 1912, with the requirements of a bankruptcy notice. The debtor, who is 52 years of age, states, up to the end of April, 1908, he was clerk and cashier with a firm of bootmakers, receiving £208 per annum; he was then thrown out of employment, and entered into partnership with another in a manufacturing business, then being carried on at 46 and 48, Sun-sheet, Finsbury. He paid the sum of £1,000 to his partner for a half-share in the business, and he (debtor) paid him a further sum of about £1 000 for his share in the concern, and became sole proprietor of the business. He carried it on at a loss up to about September, 1910, when he turned it into a limited company, with a nominal capital of £2,000, in 2,000 shares of £1 each 1,498 fully paid shares were allotted to him as being the value of his business after allowing for his liabilities, which the company took over and undertook to pay; at the time the company was formed, a first debenture for £500 was given in respect of cash to that amount advanced to the company, and the lender and the debtor were the only two directors of the company, the latter occupying the position of managing director and secretary. The company carried on business unsuccessfully under the management of the debtor up to August 9th, 1911, and prior to that date had borrowed further sums of £55 and £100 on second and third debentures. The first debenture holder appointed a receiver, who carried on the business with the debtor's assistance up to December 25th, 1912, when the receiver sold it for a sum of £500 cash, to be paid in instalments, and 300 £1 preference shares in the purchasing company. In April, 1912, the two directors, who were the only shareholders in the company, passed a resolution for the voluntary winding-up of the company. Prior to the formation of the company, the debtor had an overdraft with the petitioning creditor of about £350, and had deposited the deeds of his leasehold house, No. 4, Lessar-avenue, as security. The company took over this liability, but he (debtor) gave the petitioning creditor a guarantee to be liable for the company's overdraft up to £350. On December 18th, 1912, the petitioning creditor obtained judgment against him for £383 11s. 8d., the amount of principal, interest and costs, and thereupon commenced the present proceedings, putting the value of the security at £300 only. He is now acting as a temporary clerk at a wage of £2 per week. The debtor has kept no books of account other than those which were kept by the company. He alleges that these were the usual books of account, and that they were taken over by the purchasers of the company's business. The household furniture is stated to belong to a friend of the debtor's, he having purchased it by private treaty from the Sheriff. The debtor schedules twelve unsecured creditors, amounting in all to £21 6s. 4d., and with the exception of one for £1, these are all in respect of household and personal supplies. The creditor treated as fully secured is stated to hold a mortgage of No. 4, Lessar-avenue, Clapham-common. This is the petitioning creditor who has satisfied the Court that there is sufficient margin unsecured to support the petition in the bankruptcy. The contingent liabilities are as to £290 liabilities for moneys borrowed by the debtor, which were taken over by the company, and as to £1,700 a liability under the covenants of the lease of 46 and 48, Sun-street, Finsbury, in respect of which the debtor also claims an indemnity from the company.

Re ROBERT SUTTON, Publisher.

Under a receiving order made against this debtor recently, the first meeting of creditors was held last week, at Bankruptcy-buildings, Carey-street, W.C., Mr. Egerton S. Grey, official receiver, presiding. The chairman reported that according to statements that the debtor had made he began business 27 years ago as a publisher at 11, Ludgate-hill, E.C., with a capital of £500. After a time his business was amalgamated with another, and the trading was conducted under the style of Sutton, Dromley and Co. This business was afterwards formed into a company called R. Sutton and Co., Ltd., but after a time the debenture holders took possession and conducted the business under the debtor's management in Upper Thames-street, E.C. Eventually differences arose with the debenture holders and he threw up the management. Subsequently he assisted an agent, and three years later he became an agent for certain firms, such agency continuing for nine years. At that time he was approached by the representative of the debenture holders in R. Sutton and Co., Ltd., and after negotiations he purchased the stock and took offices at 43, The Exchange, Southwark-street, S.E., where he carried on the business for four years. Whilst trading at that address he had a partner. He afterwards removed to 67, New Oxford-street, W.C., where he traded for three years, when, as the offices were not suitable for his business, he removed to 28, Henrietta-street, W.C. There was an agreement entered into with the petitioning creditor with a view to a partnership, and the petitioner put into the business capital to the extent of £200, but at the expiration of six months said that the business was not satisfactory to him and requested repayment of his money plus 10 per cent. as agreed. The debtor gave him bills, but the petitioner eventually issued a writ against him, obtained judgment, and instituted the proceedings in bankruptcy. The debtor attributed his failure to want of capital, to bad trade, and delay in the production of books by the printers, against whom he said he had no remedy. A statement of affairs had been lodged in which he returned his liabilities at £1,580 19s. 1d., of which £1,315 11s. 8d. were expected to rank for dividend, and his assets at £241 11s. 8d. There was no offer of composition before the meeting, and it was stated that the Court had already made an order for the debtor's adjudication in bankruptcy. On behalf of the petitioning creditor the appointment of a trustee was moved, but the resolution was declared not carried and the estate accordingly remained in the hands of the official receiver as trustee.

Appended is a list of the principal creditors:—

126, Balls Pond Road, Islington, N.

Mr. ROBERT H. RUDDOCK

WILL SELL BY AUCTION, on the premises, as above, on Thursday, 3rd April, 1913, at 2, the valuable and nearly new LETTERPRESS PLANT AND MACHINERY: — Demy Folio Minerva Platen Printing Machine, fitted power, by H. S. Cropper; Foolscap Folio Platen, by H. S. Cropper; No. 2 Cropperette; Post Folio Albion Press, by Ullmer; 22-in. Lever Guillotine, by H. S. Cropper; Imposing Surface; two Tons Book and Jobbing Type (on Point System); Galleys; Chases; Frames; Wood Letter, etc., etc.

On view morning of Sale, and Catalogues of the Auctioneer, 71, Fleet Street, E.C.

A WORD OF CAUTION.

In giving the official Gazette information, it must be distinctly understood that we take official records as we find them, and accept no responsibility for inaccuracies, while, as an almost invariable rule, the facts will be found correct. We advise our readers, before forming hasty judgment, to consider that there may be in each case a satisfactory explanation which does not appear on the records.—Ed.]

ENGLAND AND WALES.

DISTRIBUTION OF ASSETS.

WATERS, W., late of Bolton-le-Sands, Lancs., retired newsagent. Claims by April 15th, to Hall, Marshall and Stewart, 49, North-road, Lancaster, solicitors for the executors.

KING, J., late of 37, High-street, Uxbridge, Middlesex, printer and newspaper proprietor. Claims by April 21st, to the executors, A., C. E. and J. S. King, 37, High-street, Uxbridge.

RECEIVING ORDER RESCINDED.

WORSTENCROFT, A. W., lately carrying on business under the style of J. Brandwood and Co., at 21, Saville-street, Oxford-road, Manchester, bookbinders' materials manufacturer. Date of order, and of adjudication order, February 6th. Rescinded, and adjudication annulled March 14th, it having been proved to the satisfaction of the Court that the debts of the bankrupt have been paid in full.

ORDER MADE ON APPLICATION FOR DEBTOR'S DISCHARGE.

ROBINSON, W. H., 133, Lichfield-street, Walsall, printer and publisher. Date of order, January 29th. Bankrupt discharged subject to his consenting to judgment being entered against him in this Court by the official receiver for the sum of £2 and £1 10s. costs. The grounds named in the order for refusing an absolute order of discharge were that the bankrupt's assets are not of a value equal to 10s. in the pound on the amount of his unsecured liabilities; that he continued to trade after knowing himself to be insolvent; that he contracted debts provable in the bankruptcy without having at the time of contracting them any reasonable or probable ground of expectation of being able to pay them; and that he has contributed to his bankruptcy by unjustifiable extravagance in living.

NOTICES OF RELEASE OF TRUSTEES.

STODDART, P. H., Melville-street, Chester-le-Street, Co. Durham, printer. Trustee, W. A. Ellis, official receiver, 3, Manor-place, Sunderland. Released January 20th.

KENYON, H., 1, Chapel-lane, Cheetham-hill, Manchester, newsvendor. Trustee, J. G. Gibson, official receiver, Byrom-street, Manchester. Released January 20th.

THE COMPANIES ACTS, 1890 AND 1908.

FIRST MEETINGS.

The ANGLO-RUSSIAN GAZETTE (1911), Ltd., Salisbury House, London-wall, London, E.C. First meeting of creditors, April 4th, 11.30 a.m., and of contributories, same day, noon, both at 33, Carey-street, Lincoln's-inn, W.C.

A New Eclipse Folder.

Messrs. Parsons and Whittemore, Inc., of 174, Fulton-street, New York, who are exporters of paper and printing machinery, announce to the Australasian and South African trade a new folder of the "Eclipse" family which makes this well-known line of machines complete. The "Perfect" Attached Folder is the name of the new machine, and it is designed to be used in connection with any single or two-revolution rear delivery flat bed press. The folder is attached at the rear of the press, and after the sheet is put through the press the second time it is automatically delivered into the folder, where it is folded either three or four times, being delivered in half or quarter-fold as desired. In order to provide a machine which will handle work in unison with the printing machine, the "Perfect" attached folder is so constructed as to receive sheets from the press without miss or spoilage; it can be simply and quickly attached or detached from the press, has sufficient weight to be durable, yet easily portable in any direction, and sufficiently simple in operation to be easily understood. The machine occupies but little more space than a delivery table, the exact floor measurements being, it is claimed, less than those of any other folder built for the same range of work. The "Perfect" is made in two sizes, No. 1 to take newspapers up to six column quarto, and No. 2 to take newspapers up to seven column quarto. This type of machine has had a very large sale in the United States, and every publisher who uses a rear delivery press should be interested in it. The manufacturers have published a very interesting circular containing illustrations and descriptions of the machine, and Messrs. Parsons and Whittemore, Inc., will be glad to send a copy to interested parties on application.

The "Eclipse" Nos. 1, 2 and 3, Newspaper Folders are too well known to make necessary any description here. In addition to these machines there is also a No. 7 "Eclipse" Combination Newspaper and Job Folder which is capable of handling a very wide range of work, and better grades of paper than most ordinary newspaper folders are capable of doing. These folders, used on regular qualities of paper up to double demy 60 lb., are doing work that would ordinarily be placed on a folder selling at £200 or more. This is especially true of publications printed on a good quality of paper. The folders are equipped with automatic straighteners at each fold and a perforator at the third fold to prevent buckling in doing 32 page work. A packer box is also provided at second, third and fourth folds.

Messrs. Parsons and Whittemore, Inc. inform us that these "Eclipse" newspaper folders No. 2 are carried in stock by their Sydney, N.S.W., office.

Canadian Paper Tariff.

Manufacturers Petition for a Revised Classification.

The leading manufacturers of bond, writing, book, surface coated, light weight wrapping and tissue papers in Canada have forwarded to Hon. J. D. Reid, Minister of Customs, at Ottawa, a petition requesting that a change be made in the customs classification under which importations of these grades of paper into the Dominion are entered.

The petition points out that under the present customs tariff bond and ledger paper, writing and envelope paper, book paper and light weight wrapping and tissue paper are all included under the heading of "All other kinds of paper, not otherwise particularised"; and it is impossible to know in what proportion these grades are brought into Canada. Surface-coated paper is included under item 198, Schedule "A," with ruled and border and coated papers, boxed papers, pads not printed, *papier maché* ware, n. o. p.

After all Permink is the only genuine Pen Carbon Paper which gives Universal Satisfaction!!
All wise Stationers Stock it
THE DEBECEY W. & M. CO.,
22, COLEMAN STREET, LONDON, E.C.

The petition further points out that under the heading "All other kinds of paper, not otherwise particularised," there was imported into Canada during the past year a large quantity of paper, and it is the belief of the petitioners that a considerable proportion of this amount could very well be made in the Dominion, but, in order that the Canadian manufacturers may determine this it is essential to know definitely how this amount is divided over the grades named.

Continuing, the petitioners say: "May we emphasise that the proper classification of these papers will discourage English and American shippers from undervaluation. As it is now, they are quite justified in marking their invoice 'paper,' making no mention of the quality, while they would hesitate to mark their invoice 'book' when the actual shipment was 'bond' or 'writing' paper, even if the Canadian buyer requested them to do so."

The petitioners appreciate the importance of keeping the classifications as simple as possible, and to this end they suggest classification under the following heads:—

	Varying in price from
Bond and Ledger Paper ...	5 to 8c. per lb.
Writing, Envelope and Cartridge Paper	4 to 6c. per lb.
Book and Printing Paper, not Coated	3 to 5c. per lb.
Surface Coated Paper ...	4½ to 8c. per lb.
Light Weight Wrapping and Tissue Paper, not heavier than 20 lbs. per ream, basis 24-inch by 36-inch... ...	3 to 6c per lb.

A Voice Typewriter.

To the wireless telegraph, the motion picture and the phonograph there has been added another mechanical wonder in the voice operated typewriter, whose inventor, John B. Flowers, a young electrical engineer, of Brooklyn, has just perfected a machine that will automatically record the voice of its master. While the machine has not at present advanced beyond the point where it can spell out words of more than one syllable, Mr. Flowers believes he will soon make it record any thought he desires to express. Mr. Flowers' invention is an adaptation to mechanical processes of the physical and mental processes that are called into use when a person writes on a typewriter from dictation. These physical and mental processes, as described in the latest number of the *Scientific American*, begin when sound waves set up a vibration on the ear-drum. These waves are communicated to a set of fibres in the internal ear, where there are thousands of these fibres, each tuned to vibrate to its own individual frequency. A vibrating fibre sends a message to the brain, which in turn controls the typist's fingers, causing them to strike a corresponding key on the typewriter.

Since typewriting from dictation becomes after long practice largely a mechanical process with the typist, Mr. Flowers conceived the idea of reproducing the process by substituting for the ear-drum, the brain, the nerves and the muscles of the typist a telephone transmitter, steel reeds and electric currents. The telephone diaphragm takes the place of the ear-drum, the steel reeds, each of which possesses its own frequency of vibration, is substituted for the ear fibres, electric currents take the place of the nerves, and in place of the human hand to operate the keyboard Mr. Flowers uses a bank of solenoids. A word spoken into the transmitter sets the diaphragm to vibrating. Each letter in a word possesses an individuality, or overtone, of its own. The overtone of a letter affects the reed attuned to it, and causes it to vibrate sufficiently to close an electric circuit. As soon the circuit is closed a solenoid pushes down the key of the letter spoken.

Mr. Flowers' machine records perfectly all the vowels when spoken distinctly into the transmitter, but it has trouble with some of the consonants in the alphabet. This shortcoming in his invention Mr. Flowers attributes to a lack of proper sensitiveness in the steel reeds. He hopes to substitute for them some material which will vibrate accurately to every shading in the human voice. Mr. Flowers admits that there are many troublesome problems to be solved before his voice-operated-typewriter attains perfection. Among these problems are those of spacing between words, the use of capitals and the recording of proper punctuation-marks.

But the principal drawback of the machine is that the writing will be phonetic. So far, Mr. Flowers has been unable to devise any scheme which will make it differentiate between "to," "two" and "too." But, Mr. Flowers says, it will be a perfect medium for recording dialect accurately.

Subscribers desiring information as to the taking out of Patents are invited to write. Letters to be endorsed "PATENT DEPARTMENT," Office of the "British and Colonial Printer and Stationer," 58, Shoe-lane, London, E.C. Telegrams: Stonhill, Fleet, London.

Applications.

5,840 DONOGHUE, M., fraud-preventing form of bank cheque, postal or money order, and other documents, and a special perforating machine for use with the same.
5,879 GILLIGAN, J., loose-leaf ledgers and the like.
5,885 HOPF, P., book markers.
5,940 SPIESS, G., method of and apparatus for applying covers to books, pamphlets and the like.
5,992 CHAMBERS, A., paper or like ruling machines.
6,002 HILTON, C. F., automatic stamp affixer.
6,009 LAIRD, N., paper bags.
6,020 BAUM, M., device for printing value and date impressions on envelopes and the like.
6,045 COYLE, J. W., feed mechanism for machines for the manufacture of cartons, paper boxes and the like.
6,052 MALCOLMSON, I. F., and NICHOLSON, K., sale of newspapers and like periodicals.
6,055 BAUM, M., device for printing value and date impressions on envelopes and the like.
6,090 "ADSHO" CABINETS, LTD., and CHARLESWORTH, T., means for advertising and displaying.
6,109 ERIKSON, C. G. A., envelopes.
6,132 MAJOR, E., book of art-press paper or Japanese tissue paper with metal writing stylus.
6,157 BENNET, J. F., envelopes, newspaper wrappers or other postal containers.
6,178 PETTY, J. P., temporary binders or loose-sheets or the like holders.
6,321 BURK, R., workmen's time recorder with printing mechanism and displaceable inking ribbon.
6,350 MATHYS, A. W., envelope making machines.
6,382 BHISEY, S. A., typecasting machine.
6,433 EAGLES, J., clip or file for letters, invoices pamphlets and the like.
6,486 MURRELL, W. H., and SOMERSET AND DORSET PAPER CO., LTD., cardboard boxes for carrying dairy and other produce or goods so as to make it difficult to tamper with the contents in transit.

Messrs. S. H. Alston, Ltd.

New Offices in Ludgate Hill, E.C.

The firm of Messrs. Alston and Westwell, which carried on business at 73a, Queen Victoria-street, E.C., has now been turned into a private limited company, and will in future be known under the title of S. H. Alston, Ltd., papermakers' agents. The business has been transferred to new premises at Vulcan House, 56, Ludgate-hill, E.C., and the company have obtained an excellent and

Photo, Arthur Weston, London, E.C.

Major S. H. Alston.

commodious suite of offices where greater facilities can be afforded their numerous clients, and their staff. Their business transactions are increasing with great rapidity, and one may safely predict that under the new arrangements Messrs. Alston, Ltd., will achieve greater success.

The paper department is entirely in charge of the managing director, Major S. H. Alston, who has had an experience of twenty years in the trade. He is thoroughly practical, and under his *régimé* the paper department will not be found lacking. The financial and bookkeeping department is under the supervision of Mr. Leonard G. Lane, A.C.A.

Messrs. S. H. Alston. Ltd., make a speciality of wrapping papers, and they have a good sound connection amongst the wholesale stationers, whose interests Mr. Alston has been studying for some years past. As agents they represent Scandinavian, German and Austrian mills, who turn out unglazed and M.G.'s, unglazed natures, sealing, cap papers, greaseproofs, colours, sulphites, news, etc. Recently some very extensive orders have been entrusted to them by well-known city and provincial firms, and the satisfactory way in which these have been carried out has led to a more extended connection in the trade, which speaks volumes for Messrs. Alston's enterprise, energy and enthusiasm in transacting business.

The export trade of Messrs. S. H. Alston, Ltd., is also very carefully guarded. Shipments are constantly made to Australia, Canada, India and China. The Canadian trade will shortly receive special attention from the firm, as a representative is going to the Dominion on a tour of investigation, combined with business and other matters. On his return, it is anticipated that the paper export department will be considerably augmented and expanded.

Messrs. S. H. Alston, Ltd., must be congratulated on the successful change they have brought about in the development of their business, and it is to be hoped the settlement in their new offices will afford them further opportunities of continuing to meet the growing demands of customers, and further enlarging their paper trade connections.

Only one case of lead poisoning was reported from the printing trade to the Home Office last month.

Exports of British Paper, etc.

"How to Estimate on Printing," by Harry M. Basford. New York: The Oswald Publishing Co.

This is another contribution to the literature of the costs question that is so much to the front at present, and, as the book is written by a practical man who has gained his knowledge at the estimator's desk, its contents carry the weight of experience, and gives advice not only to the master printer in a large way of business, but also to the man who runs a small printing shop. The various cost problems have been arranged under appropriate titles and have been presented in a business-like way and without waste of words under the following headings: "What is an Estimate?" "Theoretical and Actual Cost," "Profits from Printing," "Estimating on Stock," "Estimating Composition," "Costs in the Press-Room," "Costs in the Bindery," "Miscellaneous Items of Cost," "Advice for Young Estimators," "Estimator and Salesman," "Forget-me-nots for Estimators," "Tools and Tables." A sample estimate blank is given to suit the cost-finding system set out by Mr. Basford, and throughout the author has endeavoured to show how to compile an estimate that will show a profit on the job without raising it so high as to risk losing the order. The book is a valuable contribution to a subject that is engaging the attention of almost every printer at the present time. The price is 6s. a copy, post paid.

Among modern illustrated papers, the *Amateur Photographer* has long occupied a prominent position, and in the special issues, which are published at regular intervals throughout the year, the high-water mark among illustrated weekly class papers is reached. The Empire Number, the special spring issue of the *Amateur Photographer*, published last week, is a production brimful of interest for every camera user. Articles for those starting photography, on the choice and use of cameras, negative-making and printing processes, will be found in its pages; illustrated articles for the advanced worker, the tourist and the photographer in tropical countries; while news of interest to those who use the camera, and special notes on cinematography are regular features. In addition to this budget of literary matter, the illustrations of the Empire number of the *Amateur Photographer* show a remarkable range, both of subject and treatment. They are printed in a variety of colours and processes on art paper, forming a supplement of considerable beauty that is also of great value for all who wish to see the latest and best examples of picture-making by photography. The journal, which is edited by Mr. F. J. Mortimer, F.R.P.S., costs but twopence. It is published by Hazell, Watson and Viney, Ltd., 52, Long-acre, W.C.

Foreign and British Paper.

Our Foreign Trade.

The Board of Trade returns for February give no indication of any slackening off in the industrial activity of the country. The imports and exports of paper were as under, the values being also given for the first two months of the year, with increases compared with the corresponding periods of the previous year:—

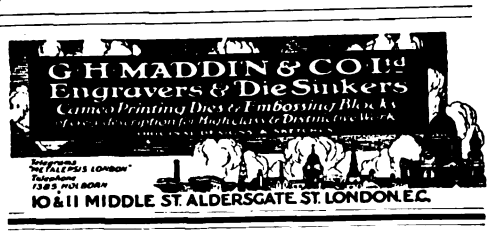
February.

Imports	£618,067 +	£121,121
Exports	310,899 +	14,467
Re-Exports ...	19,404 +	4,964

January-February.

Imports	£1,229,766 +	£146,358
Exports	645,743 +	34,547
Re-Exports ...	43,264 +	11,261

Last year being leap year, there was one more working day in February, therefore the expansion last month, which is particularly marked in imports, is of a substantial character.



Imports.

A feature of the imports is the constantly increasing demand for packings and wrappings. The value of the arrivals during February was £237,731, an advance of £43,835 compared with the corresponding month of last year. All countries competing in the British market increased their shipments. Packings and wrappings represent over 38 per cent. of the total imports, whilst those of printings and writings account for over 28 per cent. The receipts of printings and writings during February were of the value of £176,271, comprising £107,013 worth on reels and £69,258 worth not on reels. In the supply of reel paper Newfoundland shows an increase in value of £22,013, and Germany £4,963, whilst both Norway and Sweden met with decreases. The total imports of printings and writings mark an increase in value of £22,919. The only weakness in last month's arrivals was in hangings and other printed or coated papers, the total value of £32,065 evidencing a decline of £5,476. Boards found a free market, the value of the imports being higher by £56,295, and that of unenumerated and articles of paper by £3,548.

Exports.

February's shipments of British printings, amounting to £155,165, show an increase of £19,738 compared with the corresponding month of last year. British Possessions took £97,886 worth and Foreign Countries £57,279 worth, increases of £15,217 and £4,521 respectively. The demand for writings was not so active, the total value of £33,380 evidencing a decrease of £4,217. The supplies of writings to British Possessions were of the value of £22,376 and to Foreign Countries £11,004, declines of £2,548 and £1,669 respectively compared with February of last year. Amongst other exports last month, the following increases in value were registered:—Packings and wrappings, £1,524; paper hangings, £2,178; paste, mill and cardboard, £1,116; bags, £849; and unenumerated, £2,170. Decreases: Printed or coated papers (other than hangings), £7,587; manufactures of paste, mill and cardboard, £285; playing cards, £716; and envelopes, £403.

"Where Machinery is Wanted" is the title of a very smartly got-up and finely printed circular issued by Messrs. Hudson and Kearns, Ltd., Hatfield-street Works, Stamford-street, S.E., drawing attention to a forthcoming publication of special interest to exporters of British goods. Based on the fact that the Panama Canal will be ready for the passage of vessels before this year ends, and the new and keen competition that will then face the British manufacturer, a volume is being compiled as a guide and index to foreign buyers on "What to Import from Great Britain," conveying in attractive form an independent and forceful argument in favour of the British manufacturer. We note in the contents an article on "Printers' Engineering," by W. P. Penn. The circular includes specimen pages of the volume, which will contain a classified idex of advertisers printed in English, French and Spanish, and it is to be sent in bulk to the publishers' agents abroad, to be delivered by special messenger or despatched through the local post.

THE commercial value of good taste, to buyers of printing, is marked by the rising demand for advertising managers, keen in their sense of appropriateness and expert in their knowledge of the harmonies of subject-matter with paper, type, form and colour.
¶ Of two catalogues, the same in purpose, but differing in quality, the one built on the laws of good taste will win by a margin big and decisive. Tests have proved this—and the truth of it is spreading.
¶ With this recognition has come an insistent call for men of good taste, and with the vision of its possibilities, who can plan, lay out, and put through the printing campaigns of high-grade houses.
¶ To such houses and to such men *The Graphic Arts* comes as a magazine full of suggestions, and educational features that stimulate good taste in all the factors that make for good printing.
¶ Send 30 cents for a sample copy.

American Paper and Pulp Association

The thirty-sixth annual convention of the American Paper and Pulp Association was held last month, two of the days being devoted to committee meetings of the various divisions of the association.

The President's Address.

Mr. ARTHUR C. HASTINGS, who has again been re-elected to the office of president, reported a membership of 276. They received reports from 375 individual plants in the country, over 80 per cent. of the total amount of paper manufactured in the United States. He advocated the necessity of a united industry in order to secure attention at the hands of legislators, railroads, labour organisations, etc. He described their present position as "a government by the publishers for the publishers," and he criticised the Government in its action, not only in tariff matters, but in the passage of the so-called Reciprocity Act, Section 2. An increasing quantity of paper and pulp was being imported into the country at a lower valuation than American mills could produce. Cost of manufacturing was constantly increasing in the United States. It was necessary to look into the question of exportation, and the association had thoroughly investigated the South American field, a market where they hoped to dispose of a large quantity of their production. Up to the present England and Germany had secured the major part of the trade. The President seriously recommended the adoption of some uniform cost system, with the ultimate result of a more uniform market price. He had previously recommended an Arbitration Board, to take up the question of disagreements as to deliveries, etc., or as to possible changes in trade customs, and he urged that a committee be formed. He also favoured a Publicity Bureau, where new uses for paper could be investigated, and any new invention be inquired into. It was necessary for them to know the condition of supply and demand, and so operate their mills that they may be somewhere near uniform, and he believed their efforts in this line had produced good results. He concluded by stating that their work was limited only through lack of financial support, and the greater the finances the more good they could do.

Book Paper.

The report of the Book Division points out the importance of this particular branch. The census report in 1909 showed a total value of pulp and paper productions of $267,656,964, of which $54,798,840 consisted of book paper (over 20 per cent.). The total production of book papers in 1912 was 838,000 tons, 93 per cent. of the available capacity. It was urged upon the members of the Book Division to make every effort to secure the fairest consideration possible in the forthcoming revision of the tariff. The successful competition of Canada in the United States in news, would no doubt lead to attention being given to book paper in the near future. Manufacturers were urged to adopt a proper capitalisation of their producing companies, and that proper depreciation charges should regularly be made. The outlook for the immediate future was far from reassuring.

News.

The report of the News Division was presented by Mr. Herbert J. Brown, vice-president. Satisfactory water power conditions had reduced the imports of ground wood pulp during 1912; the quantity was 82,000 tons less than in 1911. News mills reporting to the Association produced during 1912 about 1,270,000 tons, or 95 per cent. of their normal capacity. This was an increase of about 65,000 tons over 1911. The year's shipments were about 1,257,000 tons, leaving stock on hand on December 31st of approximately 40,000 tons, as compared with 27,640 tons on December 31st, 1911. The importations for the year were 88,000 tons (74 per cent. free), as against 59,000 tons in 1911. By the end of 1913 the capacity of Canadian mills would be further increased by some 150,000 tons, and the American increase 30,000, making a new product of 180,000 tons, against an estimated increase in consumption of 100,000 tons.

Writings.

In the report of the Writing Division, presented by Mr. W. D. Judd, vice-president, the past year was described as an average one. The daily production in 1911 of 522 tons was increased to about 580 tons. The agitation on the part of labour for three shifts had resulted in the system being voluntarily adopted by a number of mills in the East. This change has added about 10 per cent. to the working hours of manufacture, and had also involved a general readjustment of wages. The advance in selling price was not considered sufficient to meet increasing cost of manufacture.

Wrappings.

Mr. Stokes, vice-president, Wrapping Division, reported that manufacturers enjoyed a good volume of business during 1912. Seventy-one companies reported as producing 526,252 tons, 89 per cent. of the normal output. Shipments were 100 per cent. of the ontput. Prices were well maintained. Cost of labour and all materials was advancing, and this had led to progressive mills installing new and improved machinery to reduce expense of conversion. A system of cost keeping was receiving attention. The imports of wrapping paper were not separately classified, but it was believed importations were increasing. More mills were being projected for the manufacture of kraft, and more uniformity in this class of paper was advocated.

Tissues.

Mr. E. R. Redhead, vice-president of the Tissue Division, submitted a report which complained of keen competition in the trade. Manufacturers sold their product without reference to the cost of same. The percentage of over-production was comparatively small. If manufacturers studied cost, a reasonable profit could be secured; otherwise it was simply a question of the "survival of the fittest."

Coated Paper.

In his report, Mr. M. Cantine, vice-president, said there were fifty-two coating plants at the present time. New mills and additions were increasing production nearly 20 per cent. per annum. Raw materials were advancing. The introduction of the offset process of printing led to the substitution of plain for coated papers. Profits were said to be small.

Coated Boards.

Mr. B. C. Hill, vice-president, said the year 1912 was the first year that coated board manufacturers had been represented in the association. There were twenty coating mills making coated cardboards or coated box boards, fourteen of which were members of the association. During the past year attention had been given to uniform trade customs and a uniform system of figuring costs, and serious consideration to these matters was urged.

Reports by Mr. T. Hunter on Chemical Pulp, and by Mr. Arthur D. Little, Official Chemist, were also submitted.

On Thursday evening the annual banquet took place, the number present being 725.

A PRINT from the half-tone which holds the record for largeness is on view in the Typographic Library and Museum in Jersey City, U.S.A. The size is 39¼ by 49¼ inches. The screen is 100 lines to the inch. The plate, which is beautifully engraved, was made and printed in the Imperial Printing House, Vienna, the picture being an enlargement from an original 7⅝ by 9⅞ inches in size.

THE *Inland Printer* gives the following recipe for making gelatine insoluble—Gelatine that is mixed with a 10 per cent. solution of bichromate of potash becomes insoluble on exposure to strong light. Try the following plan of preparing it: Soak commercial gelatine in cold water until it is no longer brittle. Pour off the water and heat the gelatine in a water bath. When liquid, add the bichromate in whatever strength desired. The greater the strength of this solution the stronger its tendency towards insolubility after exposure to light. Coat the article with the solution and when dry expose to light. If part of the coating is screened from the light it will be soluble while the exposed part will be insoluble.

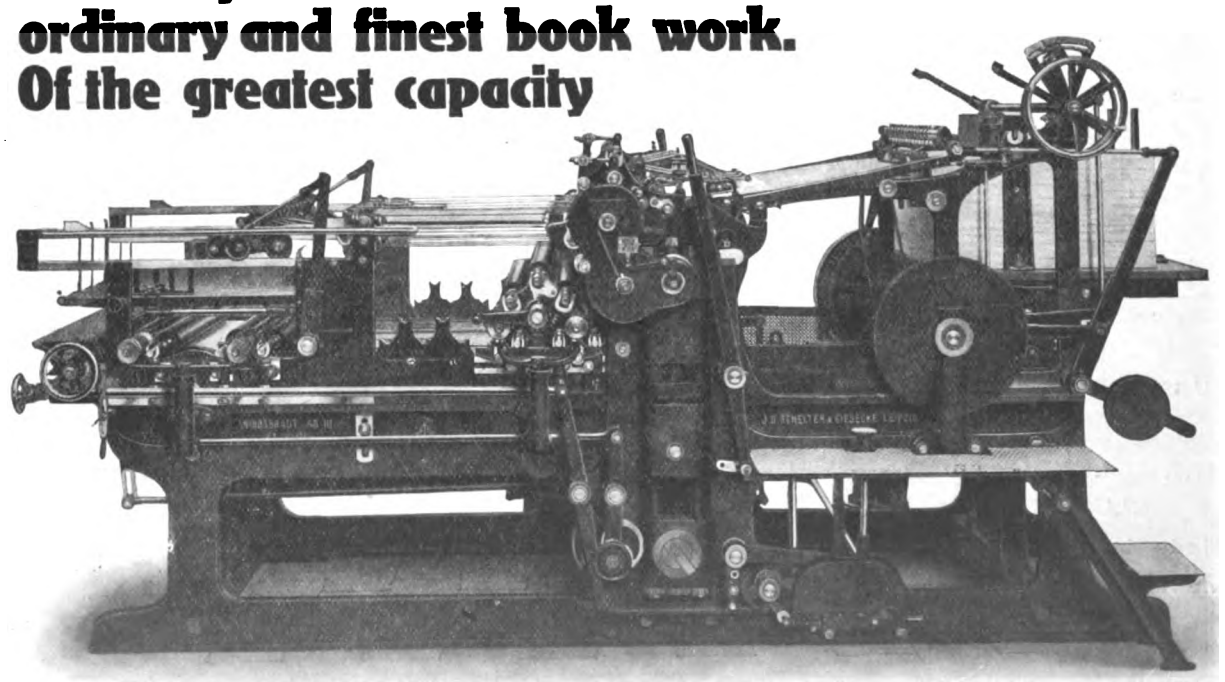
high-speed Platen Press with our patented Inking Device and other patented appliances



Exceedingly solid, simple, and perfect in construction. **Patented inking apparatus.** Unsurpassed for quick and noiseless working. Perfect register. Solid impression. For quick work and any jobs as well as for the heaviest and finest work, such as fine photo-engravings and three-colour blocks. Unique hand-safety guard (patented), stopping the machine instantaneously at the moment when the hand of the feeder is in danger and increasing, through the safety it guarantees, the output of the machine. **This guard can be had from our firm only.** Sizes No. V and special model PF are designed for extra heavy printing and embossing work.

HIGH-SPEED PRINTING PRESSES PHOENIX - WINDSBRAUT

Most simple and durable bed-motion. Air buffers. Greatest strength of Impression ensured by extra strong Cylinder and steel shaft and substructure. Finest Ink Distribution, large rollers, easiest regulation of ink-flow. Ingenious feed correctors (self-acting front and side-gauges) compensating small errors in feeding. Great output up to 2700 impressions per hour. Laboursaving appliances: special tympan-clamps, all sheet-guide parts need only axial adjustment, being vertical to the feeding-edge always ready for running. All rollers can be instantly set in and out of action.

Built in 16 different sizes, with 2, 3, and 4 FORM-Rollers clearing a full FORM. Catalogues, Testimonials and Specimens sent on application.

Drum Cylinder & Two-Revolution machines for ordinary and finest book work. Of the greatest capacity

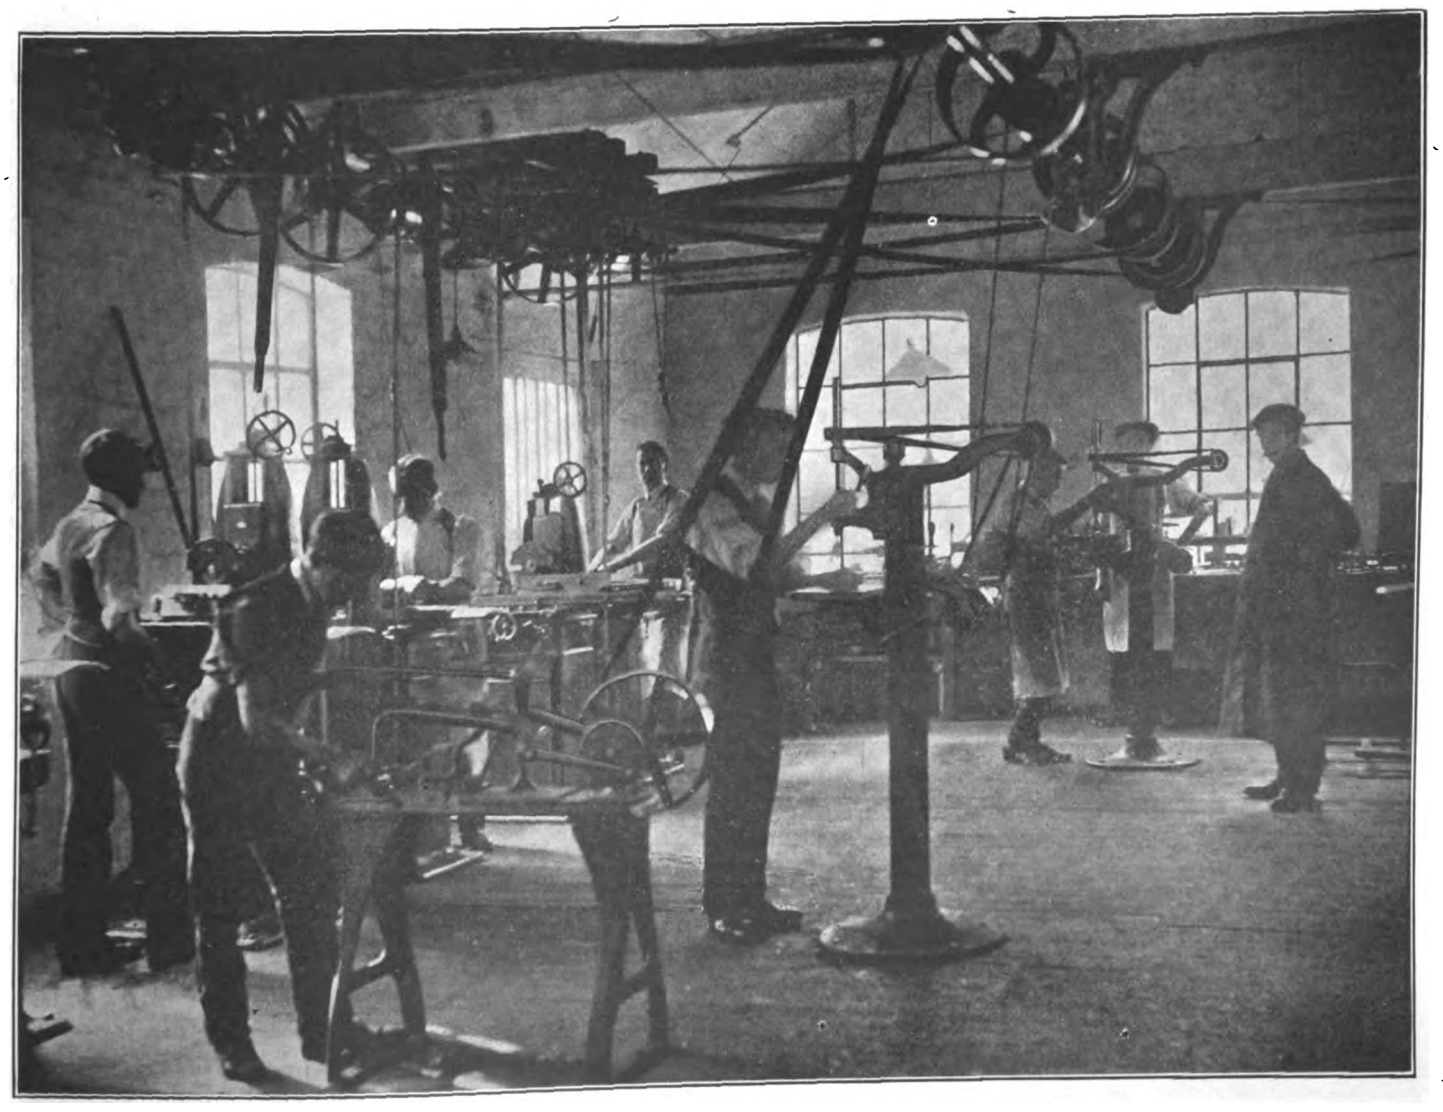
Typecasting for the Printer



WHERE THE DAVIS MACHINES ARE MADE.

A Visit to the WILLESDEN WORKS of Messrs. GRANT, LEGROS & CO., Ltd.

AT the beginning of the art of printing from movable types, and for a long time afterwards, the printer had to cast the types used in the production of his volumes, and it was not until the beginning of the seventeenth century that typefounding became a distinct calling apart from the trade of printing. The casting of types, however, partly owing to the stringent laws for its regulation and principally to the time and expense involved in the getting up of complete founts of matrices prevented the growth of typecasting as a separate trade, and it became practically the monopoly of a few firms, and even at the present day the typefounders of Great Britain could almost be counted on the fingers of one hand. With the turning of the wheels of time, however, a certain reaction has set in, and to-day the printer is tending towards the practice of the founders of the art and is finding it both expedient and profitable to cast his own founts. In fact he has been doing this to a considerable extent ever since the introduction of the Linotype, the Monotype, and the Typograph, and his practical acquaintance with those machines and their casting apparatus has shown him that the art of casting perfect types is not so much of a mystery after all, and that given reliable and well-designed and constructed machines it is quite an easy matter to produce his own founts cheaply and quickly, and so he is welcoming such appliances as will enable him to cast such types as he requires in the book or jobbing office. There have been more than one of these modern typecasters put on the market of late years, but the one that we have particularly in our mind at the moment of writing is the Davis Typecaster, an appliance that is rapidly gaining the confidence of the printer and that is much appreciated by those firms that have installed it on their premises.

The Willesden Establishment.

We have before referred to the Davis Typecaster in these columns, and to the works at Willesden where it is constructed, but so many improvements have been recently made

In the Mould-Making Department.

For Index to Advertisements see page 26.

Digitized by Google

more lasting result. In this electrotyping department the capacity of production is from 600 to 800 matrices per week.

Everything for Typefounding.

The work done at the Willesden works covers the whole art of type-making, including the designing of the letters, the making of the patterns from which the punches are cut, the cutting of the punches, the making of the matrices, and the manufacture of the typecasting machines. And the machines and appliances for the production of these are of the highest scientific and technical excellence, and possibly with the exception of the plants of the Linotype and Monotype firms, there is here installed the finest plant for the production of types that is to be found in England. In the inspection of the system installed here one has to divest one's self of the old-fashioned idea of a punch-cutter sitting down patiently to study his somewhat rough drawings of the new face to be produced, and then patiently manufacturing one by one his counter punches; then slowly and carefully striking them into the steel of the punch he is about to cut out by hand, with file and graver and laborious test and trial as the work proceeds. By this method a whole day, or even two or three days, might be spent in the production of a single complicated letter, such as are some of the old English characters. The cost, also, of a punch that is produced under these conditions is necessarily high. This, however, is here all changed. The composing machines we have just mentioned have each their own special punch-cutting department, but we believe we are right in saying that Messrs. Grant, Legros and Co., Ltd., is the only private firm that possesses

A Unique Punch-Cutting Plant,

entirely of their own design and construction throughout. Further, we believe that they are absolutely alone in not making use of any optical method of projecting an enlarged picture of the character to be reproduced upon a plane surface, and using that as their starting point in the series of operations, for they reject all methods of optical enlargement as inaccurate, and depending too much upon the human factor for skilful reproduction. They depend in their system entirely upon actual measurement of the character or design to be reproduced, taken by means of the ingenious bifilar microscope, whereby fixed points are obtained, which, when plotted upon their special paper, gives absolutely accurate results. This enables the character to be reproduced in facsimile if so desired, or modified in any way wished.

New and Efficient Methods.

After the type to be copied, or the design to be reproduced has been drawn, it is transferred to the table of a pantograph. Here, while the tracer of the pantograph is run over the outline of the letter, the cutting needle follows the shape given through a layer of wax upon a square of metal or glass, two of whose sides have been carefully ground to a perfect rectangle to correspond with two rectangular sides of the specially prepared paper upon which the drawing has been made, and from which sides all measurements are taken. After the letter has been cut out in the wax down to the metal or glass plate, the wax within the design is removed. This square, with its wax intaglio, it should be here noted, is an exact enlarged facsimile, both as regards position of the character and in other respects, of the face of the steel punch hereafter to be cut from it. The wax is then taken to the casting-room, finished off in a shaving machine, and placed with its metallic foundation, within a frame, which is subsequently filled with portland cement, which is allowed to set under water for a few hours, and is then removed from the wax, with the result that it gives a perfect reproduction on a large and predetermined scale of the letter or design desired to be reproduced. By an ingenious method it is then backed with plaster-of-paris to bring the thickness of the former to the exact gauge, within one thousandth-of-an-inch, required by the table of the punch-cutting machine. The punch-cutting machines themselves, like all other machines and processes in the room, the invention of Mr. Grant and Mr. Legros, are a very great advance upon the earlier Benton-Waldo machines, and as illustrating the care that is taken to ensure accuracy of working we noted that each machine in this room stood upon a pillar of solid cement, the top of which was flush with the surface of the flooring, while it extended downwards until a firm foundation in the the ground was reached. These columns are insulated from the surrounding earth by an air space of several inches, and in this way all tremors or vibrations caused by machinery in the vicinity, or by passing vehicles, is eliminated.

The Punch-Cutting Machines

are worked by girls, and it is curious to see this very fine work with all its highly specialised technical operations in which the micrometer and the microscope are in constant evidence, worked by young women. The whole department is under the charge of a lady who went through an artistic training at the West London Polytechnic, the South Kensington Art Schools, the Royal Academy, and afterwards at the private Art School of Mr. Cope, R.A., and Mr. Nicol.

Type design and punch-cutting going hand in hand, the firm are of opinion that all who propose in the future to design type should be thoroughly *au fait* with the technical limitations of design and the technicalities involved in the production of punches and matrices before they set themselves the exacting and onerous task of producing new type faces.

In the punch-cutting machine, the working of which has been rendered as simple as possible, and in which microsopic observation of the progress of the cutting of the punch is provided for, the punch face itself is rapidly produced upon the blank, and after being tested for accuracy, the punch, so far as the punch-cutting department is concerned, is done with, and passes into the hands of the fine work department responsible for its further progress.

The Firm's Type Faces.

Having briefly described the methods of producing the appliances for typecasting that are manufactured at the Willesden works for the benefit of the modern printer, a word or two on the type faces that are available may not be out of places. These consist of roman, clarendon, titling, and other faces that range from 5-point upwards, and are clear cut and of pleasing appearance, while the care bestowed on their production is a guarantee that the various letters range and harmonise with each other when set up in the finished line. A feature in the firm's specimen book is that they have discarded all the old names for the type that has often led to much confusion to the printer on account of their being applied by different founders to quite different designs of type, and have given their founts the general title of "Grantype," distinguishing the various faces by series bearing numbers. The specimen book, although very far from complete—as new styles are continually being added—shows an excellent selection to choose from that will provide well for the general work of any printing office, legibility and clearness being their distinguishing characteristics. Nearly 100 separate founts are now available, and new founts of matrices are being added at the rate, we

Digitized by Google

understand, of five per week, it being the firm's intention to have in the near future at least 500 separate founts of matrices at the disposal of the printer. But, readers may say, how is a printer who buys a Davis typecaster to afford the expense of a costly series of matrices, some of which, after the first use he may not need for years? That is a question that has probably been asked by many printers when asked to install typecasters, and, indeed, in the past has led in no few instances to an entire refusal to install a typefounding plant. But the commercial acumen of Messrs. Grant, Legros and Co., Ltd., has enabled them to foresee this handicapping of the caster, and to enable printers who buy their machines to dispense with the outright purchase of costly matrices, they have installed what may be called

A Library of Matrices

so that the printer, when he wants to cast a new face, has only to look up the specimen book, make his choice, and borrow the fount of matrices as he would borrow a book from a library, returning it when done with, and paying what is merely a nominal charge for the use of the fount. Nothing could be simpler, and the installation of such a system should go far to extend the popularity of typecasting machines, as after the first outlay there is little or no expense incurred, and no space occupied or money sunk in costly matrices.

A Perfect System.

At the Willesden Works a portion of the premises has been fitted up to contain the extensive library of matrices that are now available, and that is rapidly increasing. Here the different founts are stored ready for delivery on receipt of the printer's order; each carefully packed in its own special box, ready to post, and with a proof of the fount it contains taken from types cast from the matrices from which it is composed so that the printer may see exactly the letter and the condition of the matrices from which it was cast. This system should be a very great boon to the trade, and will place within the reach of even the small printer the facilities for providing himself with fresh supplies of type whenever he may want. It may now be germane to this notice to say something about the users of the Davis Typecaster. The printer is a conservative individual and is seldom rash in purchasing new appliances unless he sees that they possess merit, and that he will find them profitable. These conditions fulfilled, however, he is not slow to appreciate a new or good thing, and that the Davis Typecaster is a good thing is amply proved by the following list of a few of

Bristol.—Chappell and Co.

Sherborne.—J. C. and A. T. Sawtell.

Edinburgh.—James Skinner and Co.. Ltd.; Neill and Co.

Hastings.—F. J. Parsons.

West Bromwich.—Kenrick and Jefferson. Ltd.; Manifoldia, Ltd.

Walsall.—T. Kirby and Sons, Ltd.

Wisbech.—Balding and Mansell.

Yeovil.—*Western Gazette*, etc., Co., Ltd.

Stockton-on-Tees.—John Harrison.

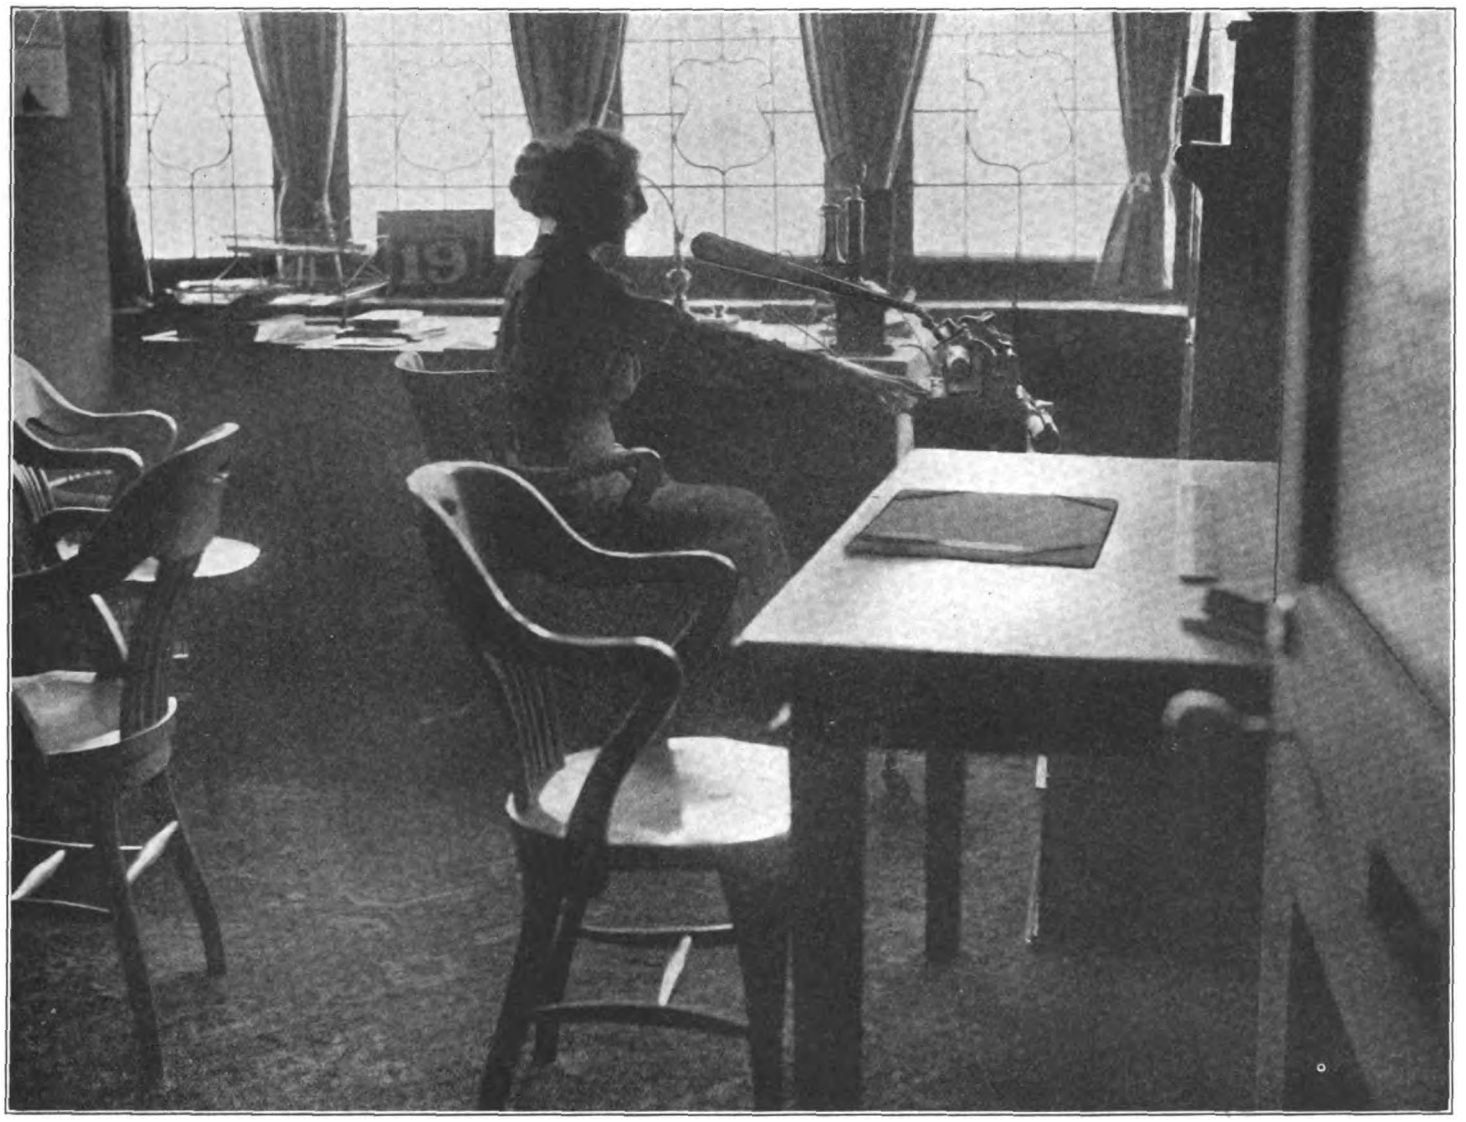
The Davis Typecaster is also being introduced into printing offices on the Continent and abroad, and machines have been installed as follows:—

Amsterdam.—J. H. de Bussy; Binger and Wegelin, Algemeen Handelsblad.

Cairo.—Fonderie Typographique Co.

Madras.—Higginbotham and Co., Government Printing Offices (two machines).

Paris.—Ault and Wiborg.



Rangoon.—*Rangoon Times*.

Toronto.—Manton Bros.

It is interesting to note that in the foregoing list of users there are several newspaper offices, and it is there that a considerable advantage is found, as even where the bulk of the work is done by composing machines there is always a considerable portion that remains to be done by hand, in the way of advertisement display, setting of financial and other matter, where ordinary type still holds its own. It was the privilege of the writer to see the installation at the *Daily Telegraph* offices, where he saw the two machines at work turning out type in readiness for the night staff of compositors, and doing it well under the supervision of an operative who simply had to watch the machines and give the little attention required while they cast away, practically automatically, turning out the finished letters, the body of which, we believe, was bourgeois.

The firm of Messrs. Grant, Legros and Co., Ltd., although young, is pushing ahead vigorously. Mr. A. E. Lund, the managing director, who is actively identified with all departments, is one of the former owners of Lund's Blue Anchor Line, a well-known man connected with steamship interests. His identification with the house of Grant, Legros and Co., Ltd., gives the firm much additional prestige. The works at Willesden Junction are under the control of Mr. Grant and Mr. Legros, with Mr. Long as the works manager; and the commodious city offices at Avenue-chambers, Southampton-row, W.C., are the commercial headquarters and sales department, which is in the capable hands of Mr. H. E. Sherwin, sales manager and director, under whose superintendence the Davis Typecasters are being rapidly installed in many printing offices at home and abroad, as the list of users we have given shows.

These few notes may aid our readers to realise that the firm in their efforts to aid the printer have brought to bear upon all matters connected with typecasting machines, punches, matrices, and the requirements of the typefounder or printer who does his own typefounding, the highest results of modern engineering practice in regard to the very exacting quality and standard of work they have fitted themselves to turn out.

A Corner of the Sales Manager's Office, Avenue Chambers.

Persia.—The imports of stationery into the district of Bunder Abbas, on the Persian Gulf, were of the value of £658 during the year ended March 20th, 1912, as compared with £1,:86 in the preceding twelve months. The imports of books and printed matter only amounted to £328, though this small total is 50 per cent. above that for the year previous.

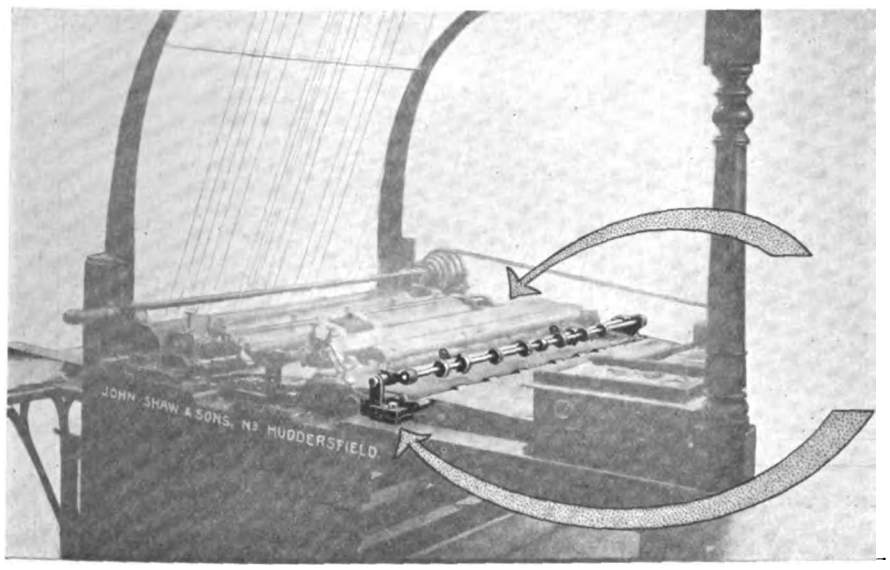
PERFORATING

Attachments for Ruling Machines.



A Clever Labour-Saving Device.

The ruling machines that are made by Messrs. John Shaw and Sons, of Honley, near Huddersfield, are known all over the world, and wherever there is paper ruling to be done one will find a "Shaw" machine ready to do

The Perforating Attachment on a Disc Machine.

it, and the firm has so, from time to time, improved their rulers that to-day they are quite at the top of the tree, as is well evidenced by the fact that they have now sold over 3,000 machines. To still further add to the utility of their rulers a perforating attachment has been introduced that enables the owner of a Shaw machine to use it as a perforator also, and that will perforate either while ruling or that can be used separately as a perforator only when the machine is not employed in ruling. We herewith give illustrations of the attachment showing ruling and perforating combined, one being attached to a pen machine, the other to a disc machine. The one on the pen machine, it will be noticed, is so arranged that the cloth is not in any way damaged. The apparatus is simple in construction, easily adjusted and operated, does not interfere in any way with the ruling, and puts a new power into the hands of the paper ruler, especially in country places, as it really provides two machines in one and so effects a saving of floor space. Four perforating wheels are supplied with each attachment, but as many more may be used as is desired. We may note here that Messrs. Shaw and Sons are extremely busy at present, in fact they have never before had such a rush of work as has been created by the current orders for pen and disc ruling machines. Their patent "Pile" feeder, too, is enjoying a good sale, as its qualities should ensure, but the pen machine, for which the firm is world-famous, is still the first favourite, and with its latest improvements it is almost impossible for the machine to go wrong. Messrs. Shaw and Sons' machines are most accuratedly turned out, and give every satisfaction wherever they are used.

The Perforating Attachment on the Pen Machine.

High Class Inks for Printers.

Most printers who aspire to do good work know how important an item in the getting out of a job is the ink. The composition and the types used may be of the best, and the paper of the finest, but unless a suitable ink is used the result can never be good. There is no economy in using too cheap materials, and the products of a good house should always be used, as there is then a guarantee that if the job does not turn out all it should be, the fault, at any rate, does not lie with the ink used.

We are reminded of printing inks by a batch of well got-up booklets that are to hand from the Ault and Wilborg London Co., 4-5, St. John's-square, E.C., that advertise the fine qualities of that firm's "Wonder" and "Surprise" black inks that have been introduced to enable the printer to turn out good work, even under the most trying conditions. The "Wonder" is especially adapted for fine work on coated or enamelled papers. It "sets" immediately and dries in about four hours. The "Surprise" does the same good work on cheap papers as the "Wonder" does on finer stocks, and is *surprising* value for its price. Both the "Wonder" and "Surprise" admit of printing, turning, printing, binding, delivering a job and securing a repeat order all within an eight-hour day. Perfect working, they flow and feed beautifully in the fountain and give clean, sharp prints on finest half-tone blocks, eliminating stops for washing cuts. They are dense, and of great colour strength, and will not "skin" in cans nor dry on press, nor injure rollers under the most trying conditions. The firm's distinguishing trade mark is a pair of imps, the one labelled "Surprise," the other "Wonder," both being known as the "Wonder Kids," and in the booklets in question they give an "inkling" of what the qualities of the inks are.

Besides the booklets the company sends out a specimen book and colour comparer in which a full range of their black and coloured inks is shown, each ink being printed in a series of discs that show the effect of printing in solid, half-tone, line, etc., and by the use of a holed card that accompanies the specimens any shade of colour can be matched.

We may here state that the present issue of the *British and Colonial Printer and Stationer* has been printed with the firm's "Surprise Black" at 1s. 6d. per lb.

Producing Printing Surfaces.

An invention patented by Mr. H. Borschel relates to a method of producing bas-reliefs from which dies, casts, and printing surfaces are obtained. Chemically pure paper is steeped and saturated in a solution of sulphate of magnesia, mucilage of quince seeds and some black colouring matter such as Indian ink. The paper is dried and then coated with a composition containing gelatine dissolved in water, mucilage of lixiviated quince seeds, sulphate of magnesia, sodium chloride and colouring matter. The composition is hardened by chrome alum before application to the paper, and the composition is applied while still warm. The paper, after being dried, is sensitised with bichromate of potash with a suitable quantity of liquid ammonia added, and is printed under a negative or positive of the picture as the case may be. After printing, the paper is immersed in a solution of water-glass and squeezed on to a smooth glass plate. The plate and film are then immersed in warm water, and the paper is detached. The film is then washed with warm water, adding if necessary a small amount of soda lye to dissolve away the unexposed parts of the film and leaving an insoluble matrix which is hardened with a solution of alum, thiosulphate, formalin, or tannin according to the substance intended to be used in the subsequent moulding process. Half-tone printing is obtained by the employment of screens in the usual manner. The film matrix is used for obtaining casts or wax matrices, which are to receive a metallic deposit forming the final bas-relief reproduction, or dies for stamping purposes; or a block of plaster of paris is first made from the film, and either used itself for printing or as a means for obtaining an electro or rubber type.

Mr. Walter S. Corder, under the auspices of the Tynemouth Public Library Committee, delivered an instructive lecture in the Municipal High School, North Shields, on "The Evolution of the Printed Book." An exhibition of old clay tablets, papyri, manuscripts and specimens of early printing was also held in connection with the lecture. These were displayed in the main hall of the school, and during the week a large number of interested visitors inspected the exhibits, some of which dated as far back as 5,000 B.C.

The Manufacture of Boards.

A British patent has been granted to Mr. A. H. Baldwin, of Syston Mills, Leicester, covering improvements in or relating to machines for making cardboard, leatherboard and the like.

The principal object is to construct the making roller or gatherer in such a manner that one youth or attendant can effect the severing of the sheets at the proper time, thus dispensing with the services of the other boy or boys and correspondingly reducing the cost of production of the boards.

Essentially the invention consists in forming the making roller in sections, that is in two or more parts, and arranging that the layers on the different sections accumulate the required thickness successively, *i.e.*, at different

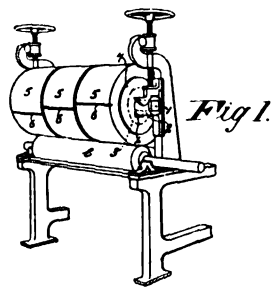

Fig 1.

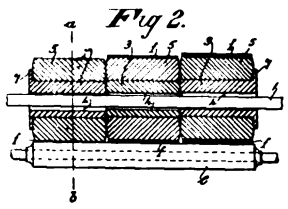

Fig 2.

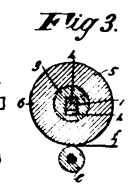

Fig 3.

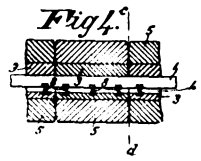

Fig 4.

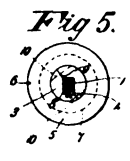

Fig 5.

intervals so that the attendant has time to sever the board on one sectional roller before another sectional roller has acquired the requisite number of layers and is ready for the severing operation.

A convenient method of carrying the invention into effect comprises a stationary shaft suitably mounted and having thereon two or more cores according to the number of roller sections. The roller sections are rotatably mounted on the corresponding cores and each core has an opening therein of larger area than the shaft upon which it is mounted so that the cores may have a limited up and down movement thereon, this movement being requisite to allow the roller sections to rise independently of one another as they accumulate the layers of pulp web thereon.

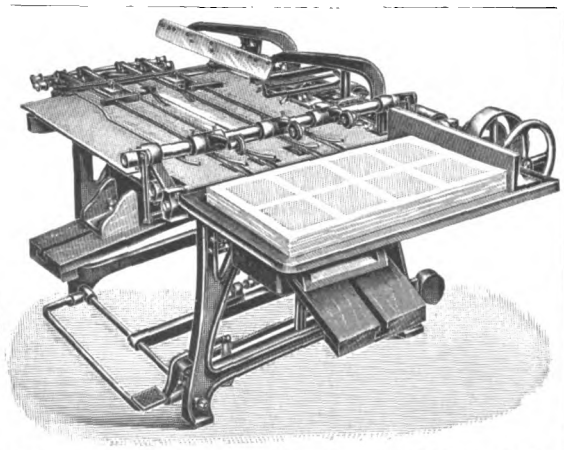
Fig. 1 is a perspective view of the delivery end of a machine for making cardboard, the making roller or gatherer being formed according to this invention; Fig. 2 shows a longitudinal section of the sectional roller, and the operation of said roller in relation to the bottom press roll; Fig. 3 is a cross section through one of the roller sections (taken on line *a*—*b* of Fig. 2); Fig. 4 is a longitudinal section, and Fig. 5 is a transverse section taken on the line *c*—*d* of Fig. 4 showing a modification of the sectional roller wherein springs are combined with the movable cores to effect a downward pressure of the roller sections.

In the drawing, the making roller, or "gatherer," is shown as being formed in three independent sections, but it will be understood that the said roller may be divided into two or any other suitable number of sections, each being independently movable on the carrying shaft. In the construction illustrated, 1 is the stationary supporting shaft mounted in any suitable form of bearing 2 at opposite ends. These bearings 2 may be adjustable in the usual manner so that the making roller may be adjusted relatively to the lower press roll *e* of the machine. The supporting shaft 1 is of square or rectangular cross section and has mounted thereon three cores 3, each core being of approximately the same length as the section of the roller it is to carry. The cores 3 have rectangular openings 4 therein, these being made larger in one direction than the size of the shaft 1 (see Fig. 3) so that they are rendered capable of an up and down movement on said shaft 1, such movement being limited by the area of the openings 4. Each core 3 has suitably and rotatably mounted thereon a roller section 5, these being in the form of sleeves, as shown. In the construction shown, the cores have a plain circular periphery upon which the roller sections having corresponding circular openings revolve. Each roller section has a groove 6 along which the attendant may run a knife for severing the pulp web. The pulp web is fed to the sectional roller in strips, a separate strip to each roller section. The pulp web may be cut into the number of strips required before it reaches the making roller and this may be effected by any known means. All the roller sections 5 revolve at approximately the same speed being driven by the lower press roll *e* or by other suitable means.

Immediately the machine has been started in operation and a number of layers have been accumulated on the making roller (an equal number on each section), the operator, if the making roller is composed of two sections, removes in the well-known manner a layer or layers from one roller section, or if more than two roller sections are employed a different number of layers is removed from each of the sections except one which as is obvious does not need to be stripped. The object of this removal is to get a different quantity of pulp web on each section of the making roller or "gatherer," it being preferable that the quantity shall vary in somewhere about the same proportion on the roller sections taken in succession. As an illustrated example of this, reference is directed to Fig. 2, where the layers of pulp web are indicated at *f*. As the machine continues in operation all the roller sections revolve and simultaneously accumulate layers of pulp web thereon, but as each section has now a different quantity of pulp web thereon, each section will accumulate the required quantity or number of layers at a different time to the others, thus enabling one boy or attendant to sever and remove the sheet from one roller section before the next section accumulates the requisite quantity and is ready for stripping, and so on throughout all the sections of the roller.

As each roller section and its core is independent of the others, the various sections of which the making roller is composed may rise (as shown in Fig. 2) individually on the supporting shaft as each accumulates its layers of pulp web, also as each section is stripped it may fall independently of the others.

To reduce friction between each roller section and the next and between each core and the next during the before-mentioned rising and falling movements of said parts on the supporting shaft 1, the ends of the roller sections 5 and the ends of the cores 3 may be rounded or made convex as shown in Fig. 2. The cores of the endmost roller sections may have a flange 7 on the outer ends (see Fig. 2) for the purpose of preventing the displacement of the roller sections carried by said cores.



In the modification shown in Figs. 4 and 5 compression springs 8 are arranged between the supporting shaft 1 and the lower part of the cores 3, the object being to increase the pressure of the roller sections 5 upon the pulp web as it passes between said roller sections and the lower press roll *e*. In this construction the cores 3 may be split or divided longitudinally as indicated at 9 in Fig. 5, the two halves or parts of the core being fastened together by screws at 10 or in any other suitable manner after the insertion of the springs 8. Instead of spiral compression springs as shown, blade springs might be used.

The usual alarm mechanism may be arranged to be operated by each roller section when the latter acquires the required thickness of board thereon.

FOR the convenience of customers and to assist in the designing of printing matter, the Victoria House Printing Co., Ltd., Tudor-street, E.C., have compiled a specimen book of the types, borders, etc, in use in their printing office. It is neatly got up, contains an excellent selection of faces, and should prove of great use both to the firm and its customers.

Utilising the Cuttings.

A writer in the *Inland Printer* says that :— In the stock-room of almost every printery you can find a shelf or two, sometimes more, carefully piled full of odd-sized scraps that have been cut in getting out various jobs. They consist of various weights, colours and qualities of paper, and, in some instances, are carefully labelled, but generally not. Now, that pile of scrap is one of the most costly and dangerous things about those plants. Incidentally, it costs time to keep it in order and sort it over occasionally for some little lot you thought was there; but that is not what we mean. It is the worst temptation to a breach of business ethics you have around you. It will cause more unpleasant feelings between you and your fellow printers than anything in the business. The above is what an organiser in the printing field has to say of the scrap-pile of the ordinary printers, and this is how he figures it out :—

Along comes a nice little job on which you feel as if you must make a close price, and you say to yourself, "I will use some of those scraps," and either go or send someone to sort them over, and waste the price of new stock in time. Then you put it down on the estimate or charge slip at a nominal price, and everybody is seemingly happy. After a little while the job or a similar one comes up for the same customer, and there is no scrap to suit, and new stock must be bought. The price is higher, and he feels that you are robbing him. He does not know that you robbed yourself the other time. He goes elsewhere, and gets a price perhaps just a little lower than yours, perhaps quite a good bit lower, because that printer, too, has some scraps. Now he is sure all printers are robbers and crooks, and he is a spoiled customer for all future time.

Again, the customer may be one you cannot afford to offend or lose, and you do the work again at the old price, and pocket your loss, and you keep on doing this on many occasions until that scrap-pile has cost you several times the price it would cost to duplicate the stock out of new goods.

This seems like a true bill, and we think that it would be wise for every printer to either use his cuttings for his own work or to cut them to some regular size, such as 3½ by 6 inches for envelope slips, or 3 by 5 inches for cards, and always make a point of selling them assorted, to show that they are scrap. And any stock that is perfect and suitable to the job should not be counted as scrap, but charged up as the amount of new stock that would be required to cut for the job. This is just and fair to all, for it will cost you more, as a rule, to trim the scrap to size and count it than it will to cut new stock.

This is one of the little leaks that the cost system is bringing to light in the plants of those printers who were of the "save-the-string" kind. No man can untie knots and straighten out enough string in a day to pay his wages and cost of supervision, and no print shop that uses judgment in buying stock can save enough scrap to pay for the handling and storage.

We have seen piles of narrow strips that ought to have gone into the shipping-room for banding cards, etc., carefully hoarded up until the edges faded, and then reluctantly consigned to the waste bag. The best way is to cut the scrap up at once or throw it away, being careful to cut your stock and buy your stock to the best advantage for size. It is not so extravagant as it sounds to the man who has never tried it.

Turkey's Paper Trade.

A Synopsis of Market Requirements and Prices.

Notwithstanding the war between Italy and Turkey, which started in October, 1911, the paper trade in general was not affected during the first nine months of 1912; on the contrary, the sales in Constantinople (according to the "Journal of the British Chamber of Commerce of Turkey"), have shown a considerable increase, and this not only in common printings, for which there has been a great demand for newspapers, but in all other kinds. The paper trade in Constantinople is classed under three heads:—(*a*) Writing and printing papers, which includes ordinary non-glazed newspaper, glazed wood paper for printing, glazed wood-free paper for illustrated papers and books, deed and official paper, and commercial and school paper. (*b*) Wrapping paper: viz., straw papers, spice papers (grey, red and blue), brown wood paper, and cardboard and strawboard. (*c*) Cigarette paper.

News Paper. — This is being supplied more and more by the Scandinavian countries, owing to the quality being better and prices lower than those of Austria. "News" is supplied in 40 to 45 grammes per square metre, in sheets and rolls, at from frs. 28 to frs. 31 per 100 kilogrammes c.i.f. Constantinople, less 5 per cent. Even these prices have been reduced owing to Scandinavian competition, which it would appear was prepared to get business at almost any figure. In case of pressing needs, however, Austria has the advantage in being able to deliver in a shorter time.

Printing Glazed Wood Paper. — This article is much in demand (imports about 1,500 tons), and again in 1912 the monopoly has been enjoyed by a Belgium factory, whose quality, whiteness and strength no other works have been able to surpass, notwithstanding incessant attempts. The price has risen from frs. 29.50 to 30.50 per 100 kilogrammes c.i.f. Constantinople, less 5 per cent., and although this firm's terms are considered very difficult, buyers have had to submit to them.

White Glazed Wood-Free Paper.—As in preceding years the Government has bought by adjudication very considerable quantities for its requirements, and it can be said without fear of exaggeration that the imports for the Government and the market in general have reached 4,000 tons per annum. Prices are frs. 45 to 50 per 100 kilogrammes, c.i.f. Constantinople, less 5 per cent. Imported principally from Austria and Germany. From the latter country supplies have been obtained only during the last two or three years.

Paper for Illustrations, etc.—This is a wood-free paper saturated with koalin, and is supplied by Belgium and Scandinavia at from frs. 40 to frs. 42 per 100 kilogrammes c.i.f. Constantinople, less 5 per cent.

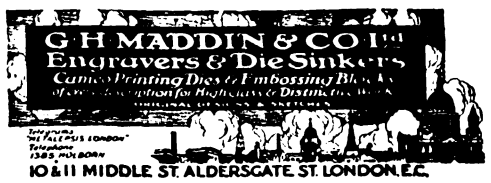
Commercial Letter Paper and School Paper.—Supplied almost entirely by Austria, with a little from France and Germany. It is a wood-free paper as above, and to cost is added frs. 3 extra for single lines, frs. 5 for double lines or squares, and printed wrappers extra.

Wrapping Paper.—Strawboard and straw paper come almost entirely from Holland; weight 240 grammes to 350 grammes per square metre, used for making paper bags and wrapping meat, etc. There is a large consumption, which is increasing, estimated at approximately 2,000 tons. Prices have been sustained and have reached £5 5s. per ton f.o.b. Amsterdam, 6 per cent. moisture free, 2½ per cent. discount. The finer qualities from France – weight 100 to 110 grammes per square metre especially – is sold at frs. 18.50 to frs. 19. net per 100 kilogrammes, c.i.f. Constantinople The consumption is about 590 to 700 tons. Another lighter straw paper, 40 to 45 grammes per square metre in small sizes and bales, is also imported, but in insignificant quantities, from Bohemia and Northern Germany at from frs. 21 to 22 per 100 kilogrammes, c.i.f. Constantinople, less 3 per cent.

Spice Paper for Packing Tobacco and Macaroni, etc.—Grey spice paper is imported almost entirely from Belgium and Holland at frs. 15.50 to frs. 16 per 100 kilogs, c.i.f. Constantinople, less 3 per cent. The approximate consumption is 1,000 tons. Red, glazed and non-glazed spice paper is sold to a great extent for the ports of the Marmara, and along the Anatolian railway line where tobacco is grown and sold in contraband. It is imported principally from Great Britain and Belgium. Owing to the large arrivals, prices are very weak, and merchants are inclined to turn their attention to a more lucrative business. Prices of non-glazed, frs. 18 to frs. 18.50 per 100 kilogs., c.i.f. Constantinople, less 5 per cent.; of glazed, £8 10s. per ton, c.i.f. Constantinople, less 5 per cent. Blue and brown are sold in much smaller quantities and come from the same countries.

Glazed Brown Wood Paper.—Imported directly from Finland or through export houses. This was at one time imported from Sweden and Norway, but these countries now do very little owing to their prices and certain exigencies of the manufacturers. The consumption has somewhat decreased owing to the bad silk worm crop in Brussa, also, to the fact that cellulose wrapping paper is being used much more in the novelty and fancy article stores. Imports reach about 1,000 to 1,200 tons. Prices from frs. 21.50 to frs. 22.50, c.i.f. Constantinople, less 5 per cent.

Cellulose Wrapping Paper. — Principally glazed on both sides, natural white and colours. The greater quantity was imported from Hungary and Scandinavia, but it would appear that the latter countries have gained the upper hand. Other countries make sporadic efforts which occasionally succeed. The consumption has barely reached 400 tons per annum, but is regularly increasing. There is a future in this article. Prices for white from frs. 34 to frs. 35 per 100 kilogs., and the colours (excepting deep red and indigo blue), frs. 1 to frs. 2 extra, c.i.f. Constantinople, less 5 per cent.



Hand-Bill and Programme Paper. — Owing to high prices in Austria, this article is again being imported from Norway, a large quantity having come from this country during the past summer. It is wanted in 22 grammes per square metre, size 45 by 55 cm., or 44 by 54 cm., folded and in packets of 400 sheets. Price frs. 36 to frs. 37 per 100 kilogs., all colours, c.i.f. Constantinople, less 3 per cent.

Cardboard. — Since the reduced prices, this article is imported from Austria only. Finland, which also supplied it, has lost the market. The prices fluctuate considerably, average crs. 15 to crs. 17 per 100 kilogs., c.i.f. Constantinople, less 3 per cent.

Strawboard. — Exclusively from Holland in packets of 24 to 25 kilogs. at £4 to £4 10s. per ton, f.o.b. Amsterdam, less 2½ per cent.

Cigarette Paper. — Comes from Austria principally, also Italy, France and Spain. There is a large consumption. Qualities asked for are *Velin*, *Job*, *Vergé*, and filigraned, Size 56½ by 74 cm. Prices vary owing to the many different qualities.

As in other branches of commerce, the Balkan War has affected the paper trade, excepting "news," which has been more in demand than ever. Nevertheless, clients in general have shown themselves in excellent colours, and it can be said that this is one of the best branches of trade on this market. Since the commencement of December there has been a slight recovery of business, and this recovery would appear to have a tendency to accentuate.

Edler's Latest "All-Size" Letterpress Rotary Printing Machine.

The Latest in Rotaries.

Messrs. Edler and Co.'s Introductions

We have at various times drawn attention to the up-to-date machinery for printers, manufacturing stationers, bookbinders and others that is handled by Messrs. A. Edler and Co., Bath-place, Rivington-street, E.C., and have now to notice two machines for the printer that are intended to meet the modern demand for the best work at a high rate of speed. The first of these is an All-Size Letterpress Rotary Printing Machine that possesses several features of interest, of which the following are the chief:—Absolute accuracy of fold, whether one fold or up to five folds are used. This makes the machine specially adapted for all classes of work requiring perfect fold, as for instance, railway time tables, and similar work. Quick adjustment of fold from one size to another. With each fold the adjustment is effected by simply turning the screw to the mark corresponding to the size required, all other parts of the folding mechanism being thereby automatically regulated. If, however, a correction in the fold is required, a very simple manipulation is needed, which in most cases can be effected without stopping the machine. Even sheets of high-class printing quality can be folded without fear of offset, as hardly any tapes are used for the folding devices.

On this machine a fixed minimum size can also be printed by cutting the sheet after printing, in the same way as is done on the ordinary fixed size rotary machine, whilst any smaller size—both in width and length—can be cut before printing. Any size sheet up to the maximum can be delivered printed on 4, 8, 12, 16, 24, 32, 48, or 64 pages, according to the number of folds used. The speed per hour amounts to 5,000 to 9,000 revolutions of the cylinders, according to the printing quality required. Even with the highest speed the sheets are properly delivered owing to a perfect pointing system, whilst accuracy in folding is fully maintained. With an average daily capacity of 40,000 to 60,000 sheets of 40-in. cutting length, the machine still secures perfect impressions. It occupies a minimum of space, viz., only about 14-ft. in length and 7-ft. in width.

There should be an unlimited field for this machine, which is already in use in many of the best printing works, for newspapers, magazines, book work, pamphlets, illustrated circulars, etc. The machine is not only built for printing in black, but can also be constructed for any number of colours on front and back, and with any special appliances, such as perforating, etc.

The other machine is an Offset Rotary, designed on an entirely new principle, and is certain to create a sensation in the printing trade generally. The machine will print first-class work on one or both sides of the paper, coming from a reel, at the almost incredible speed of 5,000 to 12,000 impressions per hour. We understand that there is at present only one machine in actual operation, but that orders have been placed by some of the largest Continental firms.

The system of working is quite simple. The printer takes an impression from an ordinary letterpress form, and takes a transfer of this impression in the ordinary way, with which every lithographic printer is familiar. The transfer is then put on a zinc plate, and etched by means of the "new universal zinc printing and zinc etching process," an effect being obtained which ensures a clean impression, even for the longest runs. As soon as the process of etching is finished the zinc plate (which is of the thickness of a piece of cardboard) is fixed on the cylinder ready for immediate printing. The transfer does not

Digitized by Google

take more time than the making of a stereo-plate, but it is much simpler and cheaper, The zinc plates can be ground very frequently, and used over and over again.

Whereas with a letterpress offset machine there are three different tints shown, viz., faint, medium and strong; this is not the case with the new offset machine, with which each revolution gives a perpetual inking, so that with each copy the inking is even throughout. The impression obtained is superior to letter-press. The quicker the machine runs within the above-mentioned limits the finer and more even the impression results.

There are one or two appliances by which the machine is made to print either one side only or both sides simultaneously, and for each printing appliance one automatic damping apparatus is provided. Each printing appliance consists of one plate cylinder and one rubber cylinder, both printing appliances being geared together.

The impression can instantly be thrown on or off by a hand lever while the machine is working. The inking and damping appliances are adjustable in the simplest manner, and all parts of the machine are easy of access.

A Russian Exhibition.

Mr. Hodgson, British Consul, in the consular district of Vladivostok, reports that an exhibition is to be held in Khabarovsk in 1913, the opening to take place some time in July or the beginning of August. The exhibition, the proposed duration of which is two months, has for its object:—"To present as complete a picture as possible of the actual condition of the Amur region; to exhibit its natural wealth and the results attained till now by the labour of its population, and also to attract the attention of the industrial forces of Russia to this wealthy region and make clear the economical interests of Russian and foreign enterprise in the export of this country's products and in the import into it of their manufactures."

The exhibits which will be received fall under the following headings:—

(i.) Objects relating to the study of geography, natural history, ethnography and economy of the region.

(ii.) Produce of the farming, forest, mining, fishing, hunting, manufacturing, and cottage and artisan industries.

(iii.) Printing and artistic work.

(iv.) Articles imported into and exported from the region.

The last date on which exhibits will be received is July 13th, 1913.

Fuller particulars of the scope of the exhibition and of the opportunities which it should offer to British trade have been communicated to the Commercial Intelligence Branch of the Board of Trade, London.

Telescopic Trestle Scaffold.

In buildings with high ceilings it is often an expensive matter to erect scaffolding for cleaning and re-decorating, but Messrs. J. H. Heathman and Co., of Parson's-green, London, have invented a telescopic adjustable and folding scaffold which is admirably suited for such work and which can be taken apart, stored in small compass, easily carried about, and erected in rooms of varying height. There is a table mounted upon wheels, which can be used as a convenient trolley when not wanted for the scaffold, and upon it the scaffold is merely attached by thumb screws. Each scaffold may be used separately with a platform, upon which a man can stand in comfort to work freely with both his hands, or two scaffolds can be used conjointly with planks spanning from one to the other across wide rooms for several men to work upon at one time. Protection rails may also be put from one trestle to the other to guard the workmen. The scaffolding can be used out of doors, as well as indoors.

An American paper says that the printer who flatters himself that he leaves little to be desired should remember that a burglar does the same thing.

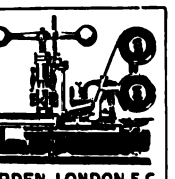
A Newspaper Wrappering Machine.

Simplicity and Effectiveness Combined.

The difficulties attendant on the wrappering of newspapers by mechanical means have, till now, been such that most newspaper and magazine proprietors have preferred to adhere to the hand methods that have been so long in practice in preference to putting in expensive and intricate machinery for the purpose. Many difficult problems enter into the designing of a machine that will quickly and effectively wrapper papers, and there is always the handicap of price to consider, for if the mechanism be costly it militates against its general use, and prevents the smaller printer from availing himself of the invention.

We had the pleasure the other day, however, of inspecting a new wrappering machine, the invention of a New Zealand gentleman, Mr. A. E. Young, which, on the score of simplicity, ease of operating, effectiveness of work, and, not least, its lowness of price, should recommend itself to all who have wrappering to do in quantities. Mr. Young is a practical man, who has had much experience in newspaper offices in New Zealand, and that experience, as applied to the work of wrappering, he has brought to bear in the designing and construction of the machine, which is very compact, and takes up but little floor space, and a special feature is that there is an entire absence of tapes with their attendant annoyances, and, all the motions being direct and positive, there is no danger of its being put out of order at perhaps a critical period of work.

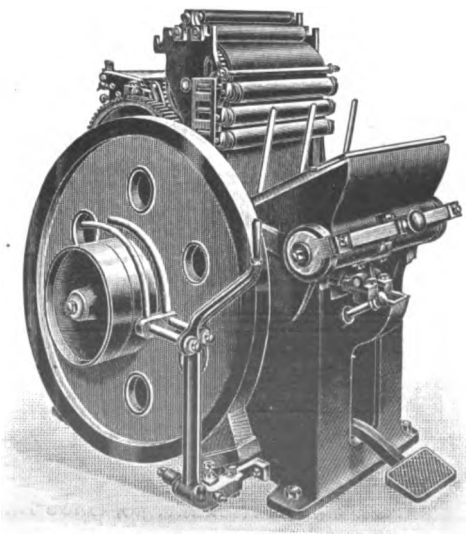
Young's Newspaper Wrappering Machine.



In appearance, the machine is somewhat like a very small cylinder printing machine, with feed board, its greatest length being 5 feet 1 inch, width 3 feet 2 inches, and height 4 feet 1 inch, the two rods that carry the roll of wrapper paper rising above the top of the machine to a height of 5 feet 4 inches from the floor. It is easily driven, the power required being but a ¼ h.p., and the speed is only limited by the capacity of the feeding operator, while, if so desired, an automatic feeder could be fitted where necessary. As we have already said, the machine is simple and efficient.

The wrapping paper is placed on a spindle at the back of the wrappering machine, and the end of the paper is led into the folding mechanism, then everything is ready for working; the machine is started and the newspapers or other printed matter are fed in. At the time of our visit daily newspapers were being folded just as they came from the press, folded to half sheet, and were fed to a back gauge, when a descending knife fell across and made the first fold, forcing the newspaper into a "pocket," or receiver, in a vertical position, folded to the quarter sheet and immediately in front of a second pair of folding rollers. Meantime the wrapper had been fed downwardly between the paper and this second pair of rollers, and was cut to the required length just as a folding blade forces the paper and wrapper between this second pair of rollers, folding the wrapper and paper upon itself for about one-third of its width, and placing it in a spring-controlled stop and immediately over a third pair of folding rollers, one of which acts as a paste roll to add paste to the wrapper and the other carries hinged flaps which effectively seal the packet at a later stage. A third folding blade now operates and forces the paper and wrapper between this third pair of rollers, thus completing the fold and placing the end of wrapper securely inside this fold. This movement also adds the paste, and the packet is forced on to a stop immediately in front of a row of pivoted fingers, and now the most important part of the whole operation takes place; these fingers force the packet on to an upwardly moving table and hold it securely while the free end of wrapper is sealed to the packet and a thorough good job made of the operation.

The machine is adjustable throughout and will take anything from a 4-sheet circular to a 100 page newspaper. A wide wrapper covering the whole width of paper up to 14 inches can be put on papers for oversea post, but a 5 or 6-inch wrapper will be found sufficient for ordinary inland post. A valuable feature of this new wrapping machine is that almost any of the existing addressing machines may be attached to it and the papers be wrapped and addressed, ready for post, at the same operation. This is a matter of considerable importance in the saving of time effected and in the way it enables newspapers to be in time for the mails. Any size paper or magazine may be folded or wrappered from a 4-page to a 100-page issue, the machine being adjustable for varying thicknesses, and the size of the folds may be altered to suit different shaped publications. Paste, gum or any other adhesive may be used in the duct, while any thickness or substance of wrapping paper that suits may be worked with.



In our issue of July 18th last, we published particulars of Mr. Young's machine, as described in his patent specification, and since then many improvements have been made in the design, and a deal of remodelling done, until now we have a handsome-looking and effective machine, of which some idea of the appearance may be obtained from our illustration.

There is a wide field for a wrapping machine of this character, and as it will also wrapper circulars, prospectuses and similar work it is an appliance that should be investigated by the printer as well as the newspaper publisher. Full particulars may be had from Mr. D. F. Dennehy, the managing director of the company, that is manufacturing the machine, at 13, Victoria-street, London.

Japan and the Roman Alphabet.

The advisability of Japan adopting Roman letters in printing and writing, writes Baron Sakatani (Mayor of Tokyo), in the *Japan Magazine*, hardly admits of doubt to anyone versed in practical affairs. The superior merit of the Occidental alphabet in simplicity and facility is everywhere recognised; and personally, I have no hesitation in believing that some day it will be adopted as the Japanese mode of writing. The quicker that day comes the better for Japan; but, of course, it will take time. Like all great reforms, it may come slowly. The use of Roman letters worked its way slowly into the languages of Europe, and it may find its way in the same manner into Japanese. Even now the convenience and general advantages of Romaji are recognised by all. Japan is to-day labouring under her burden of Chinese ideographs, which are hindering her progress and stultifying her intellect. The number of years spent in memorising thousands of Chinese characters is an immense and unnecessary weight upon the Japanese youth, when he might find far more complete equipment for expressing the sounds of his language by learning the 26 letters of the English alphabet in a week or so. Yet the adoption of Romaji meets with strong opposition in Japan still, chiefly on the part of sticklers for conservative ideas, people who are in reality opposed to progress. From these restrictive and retarding notions our people will suffer until education becomes more widely diffused, and people become more familiar with the advantages of Occidental letters. Once it comes into very general use, the advantages and convenience will become so apparent that no one will venture to oppose it.

The important question at present is how best to promote a more general use of Romaji among the people of Japan. It is a problem so vitally important to our progress that it deserves serious consideration. We cannot, of course, adopt any method so impractical and unreasonable as to force the nation to abandon its ideographs in a day. Were we to promulgate an order obliging all newspapers, letter writers, and books to adopt Romaji, the confusion would be unimaginably great, and all communication would come to a standstill. The greater portion of our people at present do not even know the difference between one Roman letter and another; they have yet to learn their A B C's, so to speak. In my opinion, the time when adoption of Western letters arrives will depend largely on the progress of common education, whereby the rising generation will become familiar with the use and superiority of Romaji. Let a fair amount of time be given to it in the public schools. By this method it may take thirty or even fifty years to accomplish the result, but it will be accomplished, no doubt. If people are rational, they always come to adopt what they regard as most for their benefit. If Romaji is really a superior way of writing language, as all Western nations now claim, it will come into use in Japan by force of sheer merit, as it has done abroad. The old Chinese characters will gradually disappear before the light of progress, as the ghosts of superstition have done.

Mr. Henry Frowde has retired after 39 years' active work as manager of the London business of the Oxford University Press.

A very neat booklet is issued by the Guild of Printers' Designers, 84, Atlantic-chambers, Brazennose-street, Manchester, under the title of "Our Representative." The booklet shows examples of show-cards, calendars, catalogue and booklet covers, title-pages, circulars, invitation cards, business stationery and illuminated addresses, which are the work of the firm. Every kind of artistic designing for the printer is executed in a style to attract customers, and at a price that is profitable to the printers. All those interested in the output of good work should communicate with this firm, who are at all times pleased to submit estimates.

Inking Photo-Litho Transfers.—When inking gelatino-bromide proofs for transfer to lithographic stones to prevent adhesion of the gelatine to the inking roller in the parts where there are whites and light half-tones of the image, a partial insolubilisation, not sufficient to allow adhesion of the ink and without preventing swelling of the gelatine, is useful. This result can be attained by dipping the paper, previously bleached and washed, for a few moments into water, 1,000 cubic centimetres; glacial acetic acid, 10 cubic centimetres; ordinary alum, 30 cubic centimetres. Inking is greatly facilitated by this treatment, according to Prof. R. Namias, in the *Progresso Fotografico*.

The Consumer OF PRINTING

THERE IS BUYING POWER FOR THE MERCHANT, MANUFACTURER OR PUBLISHER—IN FACT, ANY CONSUMER OF PRINTING—IN THE QUALITY OF HIS PRINTING.

Quality in printing, as well as pulling power, is largely good composition, and if you give the purchaser quality you create a satisfied customer.

There is business-building power and prestige for the printer in his ability to help his customers tell about their goods in an attractive and forcible way.

Advertisers want distinctive faces: and distinctive faces—to set by hand—cost money.

THE MONOTYPE COMPOSING MACHINE IS THE ONLY EFFICIENT MACHINE THAT GUARANTEES A PRODUCT EQUAL TO NEW FOUNDRY TYPE SET BY HAND, AND IS, IN ADDITION, A COMPLETE TYPE FOUNDRY, BECAUSE IT WILL CAST ALL DISPLAY TYPE, BORDERS, ORNAMENTS AND SPACING MATERIAL UP TO AND INCLUDING 36 POINT.

THE MONOTYPE IS THE MACHINE OF GREATEST PRODUCTIVENESS, HENCE THE GREATEST PROFITABLENESS.

Composed and cast on the Monotype.

Fire Prevention in the Printing OFFICE.

Writing on this subject in the *Printing Trade News*, Mr. G. D. Crain, Jun., says that:—The proverbial superiority of the ounce of prevention over the pound of cure is nowhere better illustrated than in the comparatively low cost of adequate fire protection measures over the positive disaster which fire often means, even with a full load of insurance; and the printer who thinks he has done his full duty to his plant and himself when he has procured and carefully deposited in his little safe a policy amounting to about one-third the value of his stock and machinery has much to learn.

Fire underwriters themselves are devoting more and more attention to the prevention phase of their business—for it is their business—with the obvious object of cutting down the number of losses. It would hardly seem to require argument to show that it is considerably more to the advantage of the assured than of the companies, even, to do everything possible to prevent fire. Through many channels, therefore, interest is being spurred to action which should have its effect in lessening the tremendous total of the annual fire loss in this country.

Printing plants, as fire risks, are somewhat in a class of their own. They have all of the points of hazard common to plants of all sorts requiring power equipment and machinery; and in addition to these, they have certain other elements of risk peculiar to themselves. It will not do, therefore, for the printer to imitate his friend who runs a bakery, or a machine shop, in his fire prevention measures, he must do certain special things which his business calls for, after he has taken the precautions required in other plants.

For one thing, he usually uses gasoline or benzine to clean type. Now, from the standpoint of the insurer, there could hardly be anything more hateful than either of these very useful and indispensable substances. They are extremely volatile, and extremely inflammable, almost to the point of explosiveness, both in liquid and gaseous forms. It is estimated by those who ought to know that a pint of gasoline will, upon evaporation in a closed space, render inflammable 200 cubic feet of air. This is not true when the room is ventilated; that is, when the air is constantly changing. Therefore, *ventilate!* This will to a great extent eliminate the danger arising from the volatilisation of the liquid, as the fire must be closer to the container in order to start a blaze. It is strongly urged by insurance inspectors, also, that not more than one gallon be kept in the building at any one time; and that the quantity kept be contained in safety cans. These are of various patented designs, such that the liquid cannot be spilled out, no matter how the can is kicked over or turned upside down. The advisability in any case of keeping the liquid at a distance from any open fire is obvious.

Another patented device comes into play with the disposition of oil-soaked waste, which is used and accumulates wherever machinery is operation. When allowed to lie around on the floor or in corners, it offers the finest starting place in the world for a fire, awaiting only the spark on the end of an apparently burned-out and tossed-aside match to spring into destructive action. Experts recommend a special can for this and other inflammable refuse, of a standard design, the principal feature of which is a self-closing lid, thus discounting even that degree of carelessness which, after placing the waste in the metal can, would forget to place a separate top on it.

The waste paper, which is inseparable from the operation of a printing office, is another grave source of danger in the starting of a fire, and a maker of speedily spreading blazes when once the fire has started. Some printers permit such litter to accumulate until walking about is a matter of considerable difficulty, having a weekly or monthly or semi-annual clean-up, after which the stratification of cast-off proofs and other *débris* begins again. This should not be allowed. A closed bin, preferably metal or metal-lined, should be provided as a receptacle into which all waste paper should go, and it should be disposed of daily, unless a tight cover can be used, in order to prevent all danger from this source over night. The ordinary metal garbage can would serve this purpose very well in the small plant, and could also be used in such plants as a receiver for oily waste and other trash.

Linotyping machines, stereotyping machines and other equipment requiring the direct application of heat, are obviously a prolific source of danger of fire, and the fuel used may be of a character which renders the danger greater. Gas, of course, is almost the ideal fuel for this purpose, because of the ease with which it can be controlled. In places where gas is not available, however, it is necessary to use gasoline, and this is always dangerous by its very presence, as already pointed out. In any case, such machines should be placed upon some sort of metal flooring or floor covering, and never upon the bare wood; and concrete is better still. Where these measures are used, there is nothing to catch fire in case the machine or the fuel decides to become unruly.

Presses, like other machinery, in printing or any other plants, requiring constant oiling, should likewise be placed upon metal or concrete, instead of upon wood. There is always more or less oil gradually dropping from such machines to the floor beneath, and where this floor is of wood, its saturation with lubricating oil renders it inflammable in the highest degree.

Where electrical equipment is used, as in many modern plants, the greatest care should be used in order to prevent fire from this source. It is none the less dangerous that this is not apparent. A whirring motor or a lifeless looking wire may seem harmless enough, but the power they represent may take shape in flame as well as in light or other forms of energy. Motors should always be properly enclosed, and wires not only insulated, but, if possible, carried in conduits. In a large plant of a big publishing house in the Middle West all wires are not only placed in conduits, but the conduits are embedded beneath the wood floors in several inches of cinder concrete, thus placing them beyond any possibility of causing fire. There is probably much less danger from electric equipment than from a steam plant, and possibly less from either than from gasoline power, unless the engine is located, as it should be in any case, at some distance from the plant proper.

If larger plants than the average are considered, and those housed in big buildings of their own, such as newspapers of the larger cities occupy, an immensely larger field than that peculiar to printing plants as such is opened up. The architectural requirements of larger buildings in order to render them fireproof, in the strict sense of the word, are numerous, and yet not nearly so well understood as they should be, even among architects themselves. Many a man has ordered a fireproof building, as he would a medium broiled steak, relying upon his architect as upon his cook to turn out what was called for, only to find that when the building was completed the experts of the underwriters could pick enough holes in the fireproof scheme of that building to make it look like a very fire-trap. The vital matters here are the material of which the building itself is constructed, the kind of framework used, the roofing and flooring material, the question of open elevator shafts and stairways, to form flues and conduits for the spread of the flames; and many other things.

The printer or newspaper man has not always absolute control over the structural details of the building in which his plant is housed, and, even if he builds it himself, it may not be just as he would like to have it in the important respect of being fireproof, or nearly so: but there is practically no case where he cannot take the fundamental precautions here laid down. If he cannot provide concrete, or concrete finished floors, or iron or steel sheeting for his machinery to rest upon, he can use zinc, such as is used under stoves.

There is perhaps no kind of plant which suffers more from a fire than a printing house. The type, half melted and scattered, is a total loss, save as scrap metal; the paper stock is highly inflammable, and the machinery itself is much more delicate than that in most industrial concerns. There is every reason, therefore, why the printer should take a few extra precautions in the way of fire prevention, even if it were not a fact that his business adds a few more hazards to the ordinary industrial risk. Apply the ounce of prevention, take the stitch in time and get a better insurance rate.

An Automatic Card Feeder

For Attaching to Ruling Machines.

An ingenious appliance in the form of an automatic card feeder has been introduced by the W. O. Hickok Manufacturing Co., of Harrisburg, Pa., U.S.A. It has been designed to work in connection with any of the firm's ruling machines, and our illustration gives some idea of its appearance. It is very rapid, and will feed cards as quickly as desired. It has been introduced. It will feed a great many more cards per hour than the ruling machine is able take to care of. These card feeders have become very popular in the United States.

Hickok's Automatic Card Feeder.

is also arranged for struck or down line work, and will space cards accurately to the striker gate of any Hickok Automatic Ruling Machine. It takes a card from 3 by 3 inches to 10 by 10 inches, and is regularly equipped with striker gears for cards 3 by 5, 4 by 6, and 5 by 8 inches, although special gears for odd-sized cards can be furnished at a small additional cost. It is very easy to attach to the ruling machine, and is positive in its feeding. The reason for feeding cards singly is, that it is impossible to get a perfect register by ruling them in sheets and cutting them up afterwards; therefore this small card feeder

Workmen's Compensation.

A Curious American Decision.

In a recent issue of our American contemporary, the *Printing Trade News*, it is stated that: "Workmen's compensation laws are bringing forth decisions of considerable importance to employers of labour. A few weeks ago the Wisconsin Industrial Commission awarded Millie Smith, widow of Patrick Smith, a judgment for $2,040, to be paid by the Nebraska-Edwards Paper Co. in weekly instalments. Smith toppled from a wagon while drunk and was killed. The law omitted any reference to injury through intoxication, though the Commission stated it was discussed while the Bill was under consideration, and the point was made that any one using liquor excessively should not be employed if deemed unfit or dangerous. Manufacturers are reported to be greatly impressed with the decision, and intend taking special care not to employ habitual drinkers. Some are offering a premium to total abstainers. The Circuit Court of Dane county has been appealed to by the paper company to review and set aside the findings and award. Wisconsin employers, if the award is upheld, take a great risk if they employ anyone who occasionally is over-indulgent with liquor, since at any time an accident is possible while they are irresponsible from drinking. The injury and annoyance commonly resulting through absence when most needed, or by appearing in an unfit condition have been bad enough before, but this makes a climax. It is a noticeable feature in modern printing offices that there is a great improvement in temperance over the old days when all composition was done by hand." This decision should cause quite a rush on the temperance societies, if it forces employers to insist on their hands being total abstainers.

Paper and Pulp Makers' Directory

British Patent No. 3,551, 1912.

WRITE FOR PRICES AND TESTIMONIALS.

Over 2,000 of the MOST PROGRESSIVE COMPOSING ROOMS in the STATES USE

☛ A PRINTERS' TOOL, designed on lines suggested by the Practical Printer, that will Saw, Trim, Mitre, Bevel, Drill, Rout, Mortise, inside and out, Jig-Saw, Grind, and Plane Type-high—every operation to point measurement. . .

The Miller Saw and Trimmer

Among British Users—

Messrs. Thos. Nelson and Sons, Edinburgh, have installed a second.

Messrs. Tillotson and Sons, Ltd., of Mealhouse Lane, Bolton, write:

"The Saw and Trimmer which you supplied us with early last year has proved a veritable acquisition to our Composing Department. It is one of the best investments we have ever made: there seems no limit to its usefulness."

Messrs. the Arthur Cox Illustrating Co., Ltd., of Ludgate Hill, Birmingham, write:

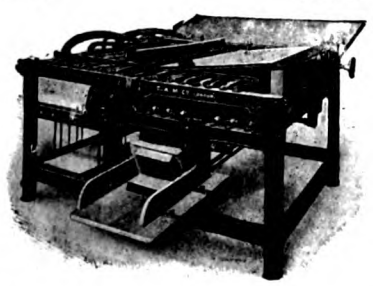
"After submitting the Miller Saw Bowler and Trimmer to exhaustive tests, we are pleased to say it has proved itself to be just the tool we have been seeking. It fulfils all your claims as regards accuracy and universal utility, and we find it indispensable for the various out-of-the-way jobs that are continually cropping up in a mounting room. It certainly is a big step in front of any other squaring machine we know of for the accurate handling of big numbers of small or medium sized blocks."

Messrs. Turner and Dunnett, of Liverpool, write:

"Your favour of the 22nd instant is to hand. We have now had the Miller Saw in use for over 12 months and have proved it to be a most useful machine both for the stereo and Composing Departments. For cutting and mitreing brass border rules, squaring half-tone blocks, routing for two-colour work and the numerous little jobs that require quick and accurate execution, it has more than fulfilled our expectations."

FURTHER TESTIMONY TO OUR JOB FOLDER.

Messrs. Garside and Jolly, of Warrington, write Sept. 12th, 1912:



The Quad Demy Folding Machine purchased in June is doing the work required in a very satisfactory manner. Though of the ordinary pattern, it is being used with accurate results for an awkward sheet of which one dimension is under the minimum size limit guaranteed, viz., a sheet 34½ in. by 14 in., folded to long 12mo (11½ in. by 3⅛ in.). The quotations from other makers for a machine to fold this special size sheet were quite prohibitive, being two, three, and four times the price of your machine. The miscellaneous folding done has also been very true and even.

Yours truly, (Signed) F. GARSIDE.

THE BRITISH FOLDER.

MOST UP-TO-DATE DROP-ROLL JOB OR NEWSPAPER FOLDERS ON THE MARKET.

FOLDS INSETS

PASTES TRIMS

Up to 2,500 complete copies per hour.

Messrs. Henry Detloff, Ltd., 26, Sun Street, Finsbury Square, write:

"The Combination Newspaper and Job Folding Machine recently installed by you for us, is proving in every way satisfactory. It is running at a good speed, yet is so easy to feed that the output can be confidently relied on. The quantity and quality of the machine's product is excellent."

"GAZETTE" Office, Uxbridge,
February 6th, 1911.

Canadian-American Machinery Co., Ltd.,

Dear Sirs,

According to my promise I have the greatest of pleasure to write you concerning the British Folder, inasmuch as in addition to giving me the advantage of producing 10 or 12-page newspapers (insetted, pasted, folded, and cut at heads), I am able to fold the high-class publications herewith enclosed, which alone should be a sufficient recommendation to anyone who is laying down a folding machine.

(Signed) CHARLES E. KING.

Messrs. Jas. Broadley, Ltd., of Gutenberg Works, Accrington, write:

"We have now had the Miller Saw Trimmer, Jig Saw and Router running sufficiently long to be able to speak to its value. We have tested the machine in every possible manner and have found it will do all that you claim for it with a degree of accuracy which has been a revelation to us. We are at a loss to know how we got along without it in the past. . . ."

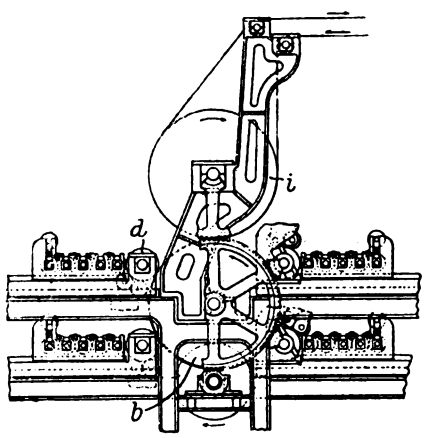
NEW INVENTIONS AND IMPROVEMENTS.

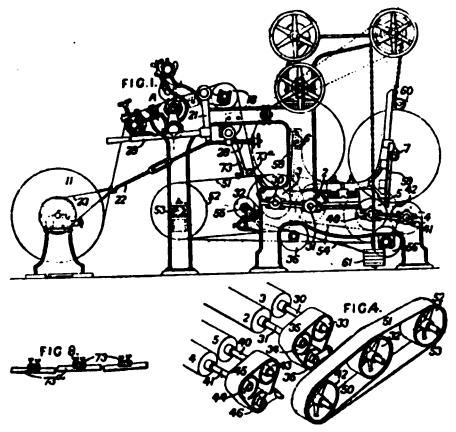
Copying Documents, etc.



Under an invention by Messrs. Hurwitz and Co., letters, drawings, etc., to be copied are written or drawn with an ammoniacal ink, for instance one containing gallic acid, sulphate or chloride of iron, or both, gum arabic, ammonia, and water. The document is pressed against a glass, porcelain, enamel, or like roller or plate, which is previously coated with a solution containing grape sugar and alum, the preferred solution consisting of grape sugar, alum, hydrochloric acid, magnesium chloride, and water. The composition with the design on is then treated with a solution of boracic acid in glycerine in order to render the blank parts insensible to the subsequent inking, which takes place before prints are obtained. The grape-sugar

composition referred to may be used for cleaning an old design off. Instead of using an ammoniacal ink as described, a dried ink may be applied to a design, etc., produced in ordinary ink. The process may be carried out by the apparatus shown in Fig. 3, in which a glass sheet *a* mounted on a resilient cushion *f* is supported by a bed *r* with bevelled edges *c*. The grape sugar solution is applied to the sheet *a*, and when set, a letter, etc., is placed on the bed and pressure is applied thereto by a pad *g* on a cover *k* pressed by means of springs *i* on to the letter, the pressure being applied for from a half to eight minutes according to the nature of the document. To store the plate *a*, it is placed with its coated side downwards and with its edges resting on the edges *c*

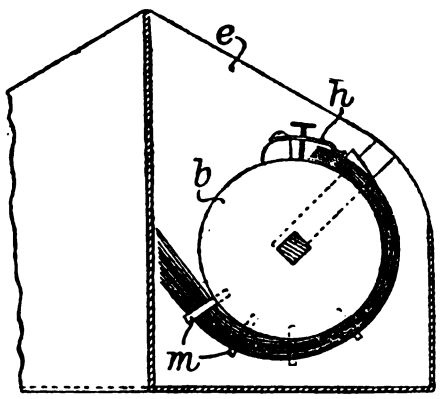
Rotary Offset Machines.



A lithographic machine for printing on paper, fabric, etc., patented by Mr. J. A. J. Hayes, is constructed with continuous printing, offset, and impression surfaces, so that a continuous unbroken pattern may be printed. As shown, a machine of the kind described in specification 9,365, 1907, is employed, the printing cylinder *d* being similarly mounted and driven, but being formed with perfectly continuous surfaces. The impression cylinder

of the machine described in the before-mentioned specification is replaced by an offset cylinder *b* having a continuous surface, and there is an additional impression cylinder *i* which is also formed with a continuous surface. The cylinders *d* are exact factors of the cylinder *b*.

Web Feeding and Winding Apparatus.

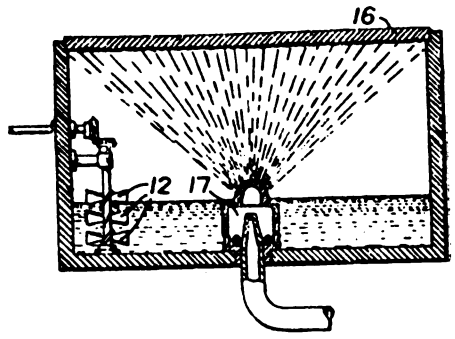


This invention relates to web feeding and winding apparatus particularly adapted for use with a slitting machine, such as that described in Specification 3,735, 1911. The web passes to the slitting mechanism A from the roll 11, which is braked by a band 23 connected by a link 22 to one arm 21 of a pivoted frame, the other arm of which carries a roller 18. Should the web become too taut, the roller 18 is depressed against the action of the spring 28, thus slackening the band 23. A hand lever 29 is provided on the arm 21. The series of narrow webs proceed from the slitting mechanism over a spreading device 73 consisting of a number of adjustable resilient surfaces 73ª which can be arranged, for example, as shown in Fig. 8, for separating the paths of three webs which are to be wound on a common spindle. After passing the spreader, the several strips pass between a roller 53 and an endless belt 54 passing around rollers 55, 56, the former of which is adjustable to lighten the belt. The various strips then pass around the rollers 3 or 5, and are wound on spindles 6 or 7, which rest on and are rotated by the rollers 2, 3, 4, 5 respectively. The rollers 2, 3, 4, 5 are driven by a belt 51

from the shaft 53, as shown in Fig. 4. The shafts 30, 40 of the rollers 3, 5 carry respectively pulleys 32, 42, around which pass a belt 50, and also the driving belt 51 driven from the pulley 52 on the shaft 53. Adjacent to the pulleys 32, 42 are pulleys 33, 43, encircled by endless belts 35, 45, which also pass around pulleys 34, 44, on the shafts 31, 41 of the adjacent rollers 2, 4. These belts are kept taut by jockey pulleys 36, 46, held down by counterweights, by adjusting which any degree of slip can be allowed to the rollers 2, 4, by which, owing to the inclination of the guides for the spindles 6, 7, the winding is chiefly effected. The spindles 6, 7 are carried in bearings which slide on inclined guides 58, 59. A heavy roller 60, the pressure of which may be varied by an adjustable counterweight 61, may rest on the paper rolls during winding. Mr. J. A. White is the patentee.

Making Paper Bags.

Paper bags of the kind in which one of the sides is longer than the other, or in which a segmental portion is removed from the shorter side, are, under an invention by Messrs. M. and S. Blogg, held or stored in a device in such a manner that a bag can be opened and removed easily. The bags are laid round a drum *b* or a curved surface, and are held at the top by means of a blade spring *h* which presses on the centre of the

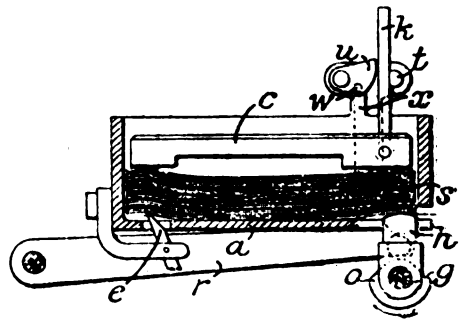


bag tops. By reason of the shape of the bags, the spring presses on one side only of the outermost bag, and the other side of the bag bulges out so that a finger can be inserted in the open mouth and the bag removed. The bottoms of the bags are held either by an extension of the spring *h* or by a separate clip *m* as shown. Several of the holders are arranged in a casing *e* and they may be of different sizes.

Photo-Mechanical Printing Surfaces.

This invention relates to an improvement on the method described in Specification 11,528, 1910, for obtaining separate printing surfaces for the component colours. The component negatives are, in accordance with the above-mentioned specification, mounted endways on a glass plate, and marked for subsequent sub-division with an allowance for a margin. A piece of carbon tissue, cut lengthways, is exposed under a screen and then independently exposed under the negatives simultaneously. According to the present invention, instead of cutting the prints and manipulating them separately under identical conditions, the undivided carbon tissue is first of all washed as a whole before it is divided into separate prints for subsequent identical treatment. The division may be effected under the water. The prints are afterwards used as transfer resists for obtaining etched printing surfaces. Other specifications are referred to.

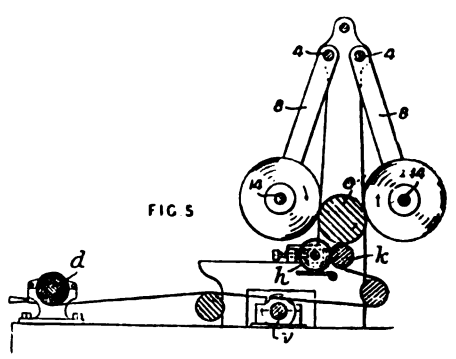
Coating Electrotypes.



Under an invention by Mr. H. S. Levy, an electrotype mould 16 to be coated with graphite or other conductive powder is placed face downwards above a device for projecting spray containing the powder, and is not immersed in liquid. The spraying device, or the mould itself, may be moved so as to produce even distribution. The aqueous or

other liquid from which the spray is raised is agitated by paddles 12, to keep the powder in suspension. The spraying device may be an atomiser 17 or perforated tube through which compressed air is forced, or a paddle-wheel. Non-adherent particles may be afterwards washed off the mould while this is still supported face downwards.

Feeding Sheets.



In a machine for feeding sheets to printing, ruling, or pasting machines, the invention of Mr. H. Kurkiewicz, the pile of sheets in the hopper *a* rest at the rear on an inclined knife *e*, and are fed by two friction feeders *h* on a shaft *g* arranged beneath the front of the pile. A presser bar *c* rests permanently on the back of the pile, and is hinged at the front to a rod *k*, adapted to be gripped between a pin *t* and

an eccentric plate *u* on an extension *s* of a lever *r*, which is oscillated by a cam *o* on the shaft *g*. On the downward movement of the lever *r* a pin *w* on the plate *u* engages a projection *x* on the hopper, releasing the bar *k* and allowing the presser to fall upon the pile,

Cutting and Winding Paper.

In a machine for slitting and winding paper, as patented by Mr. P. Hellbeg, the paper strips are supported by a drum for their whole length in the interval between cutting and winding, and are wound on separate bosses spaced apart. The grooved roll, with which the cutting-discs coact, is driven by gearing from the drum, which is itself driven frictionally from the paper being wound. The web of paper from a spindle *d*

passes between cutting-rolls *h*, *k*, and the cut strips pass over a drum *o*, and are wound alternately on spindles 14. These spindles are carried by pivoted arms 8, and bear gravitationally on the drum *o*. They are driven by chain gearing from the spindles 4, which are similarly driven from the shaft *v*,

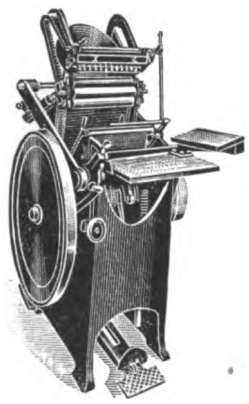
Digitized by Google

The drum *o*, which is frictionally driven by the rolls of paper, drives, through gearing, the grooved cutting roll *k*. The spindles *d* are provided with removable bosses on which the strips are wound, and are mounted in bearings readily detachable from the arms 8. The spindle *d*, which may be adjusted laterally, is furnished with brake blocks operated from a hand-wheel to vary the tension of the web. The cut strips are specially intended for spinning into threads, etc.

Photo-Mechanical Printing.

Mr. N. Bendixon's invention relates to a modification of the method described in Specification 17,215, 1908, for producing negatives for making printing blocks to give effects in which no pattern appears in the textual matter of the print, or alternatively in which a different pattern appears there to that in the background. A diapositive of the original is printed in combination with the pattern plate. From the negative so obtained, which has no pattern in the textual matter, a diapositive is made, and this diapositive is reproduced in combination with an original negative, the two plates being shifted slightly relatively to each other. The final plate obtained is subsequently reproduced through a screen to obtain a photo-mechanical printing negative. The specification as open to inspection under Section 91 (3) (*a*) comprises also a method of obtaining different patterns in the textual matter and background. The negative is first combined with one pattern, and the plate thus obtained is combined with the diapositive plate relatively shifted, and with a different pattern plate sandwiched between.

Imitation Oil Paintings.



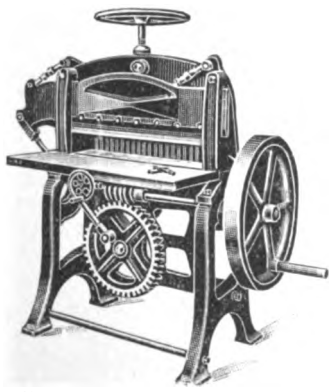
Under a patent by Mr. H. P. Thompson, printed pictures, etc., are treated so as to resemble oil paintings by embossing them by means of an electrotype surface obtained from a wax matrix prepared in the following manner. A copy of the picture is made transparent, and is fixed face downwards on the front of a glass or other transparent sheet. The back of the print is then covered with wax, and by means of a wire, or bristle brush, or other tools, marks are made on the wax by the aid of a reverse picture seen through the wax. An electrotype surface is made from the wax matrix, and is used to emboss the prints from the back; or a reverse electrotype can be made from the first electrotype and be used to emboss the prints from the front. Alternatively, such a reverse electrotype can be made by fastening the print face downwards on glass and coating the glass on the other side with wax, or by securing the print face upwards and coating the face of the print. Where the canvas on the original picture is shown, an imprint on the wax may be obtained by pressing canvas upon it. The provisional specification also states that the embossing-block may be produced by coating a metal or wooden block with wax, tracing a reverse of the picture thereon in dark colour, and adding a second layer of wax, which is treated to form the requisite brush marks; an electrotype is then taken from this.

Celluloid Printing Plates.

Dies for making celluloid or similar printing plates, as patented by Mr. A. E. Bacigalupi, are formed of a plastic composition which sets hard. It comprises hydrated silicate of magnesia, carbonate of lime, baryta, powdered slate, and manganese earth, in suitable proportions, and also a small amount of calcareous or other substances such as plaster or talc. These materials are ground, mixed, and made into a paste with water.

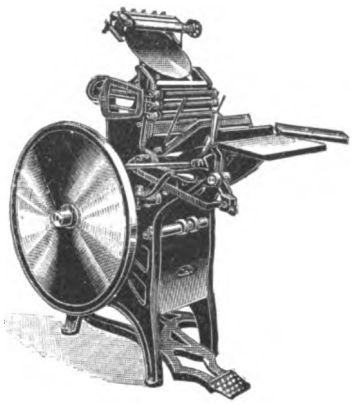
T. C. THOMPSON & SON'S SPECIALITIES

All our own Manufacture.



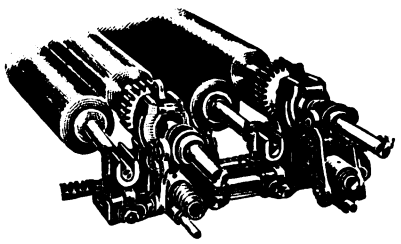
PATENT "GEARED-INKER" TRIUMPH PLATEN PRESS.

Made in two sizes Crown Folio. Foolscap.
The only Platen fitted with Geared Inking with Geared reciprocating Rider Roller.



SINGLE-HEADED "RAPID" COMBINED PUNCHING & EYELETTING MACHINE.

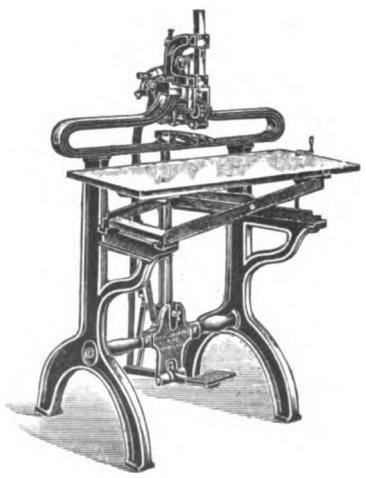
Punches hole clean out. Automatically feeds and inserts the Eyelet at one stroke. Can be used for punching only. Speed over 3,000 per hour.



"GEM" GUILLOTINE.

Made in three sizes.
No. 1 to cut 24 inches. No. 2 to cut 26 inches.
No. 3 to cut 32 inches.
Strong and silent, Aocurate cutting guaranteed.

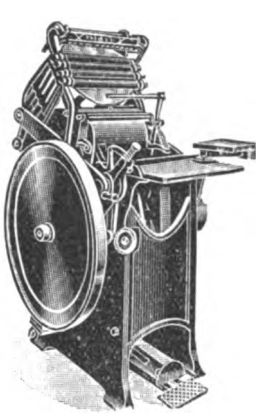
PATENT "GEM" PLATEN PRESS.



Made in two sizes 8 by 5 inside chase.
11 by 7 " "
Faster than any other platen. Best in design.
Absolutely silent.

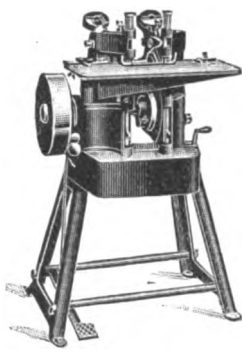
SELF-CONTAINED GEARED INKING APPARATUS.

With Reciprocating Riders.



Suit any make or size of Wharfedale.
Long Roller Bearings. Simple Adjustment.
Steel Machine-cut Racks and Gears.

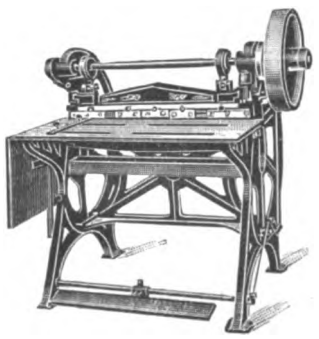
SINGLE TREADLE PAGING MACHINE.



With Latest Improved Disc Inking.

Fewest working parts. Can be worked at Lightning Speed. Hundreds in use.

"TRIUMPH" PLATEN PRESS WITH ORDINARY INKING.



Made in two sizes Crown Folio. Foolscap Folio
Solid impression. Speed 2,000 per hour.
Many Improvements.

DOUBLE-HEADED "RAPID" COMBINED PUNCHING & EYELETTING MACHINE.

Two Machines in one.

Either or both heads can be used for punching only. One head can be put out of action instantly. Inserts 6,000 to 8,000 eyelets per hour.

"EXCELSIOR" POWER PERFORATOR WITH SLIDING & LIFTING SECTIONS.

Treadle Perforators with Moveable Section.
Latest Design. Sizes—32, 27, and 20 inches. Hand perforator, open ends. Used in all the largest houses.

Our Special Colonial Issue.

ALTHOUGH week by week we endeavour to make the contents of the *British and Colonial Printer and Stationer* of use and interest to our Colonial readers, yet in the special issues which we publish from time to time, and of which this is one, we address ourselves more particularly to our friends abroad, both in their interest and the interests of our advertisers, who support us by inserting their business announcements. To this end we endeavour to reach every good house connected with printing, stationery, or fancy goods, throughout the widely-spread British Colonies; our well-kept and carefully compiled lists, the result of thirty-five years' experience enabling us to do so in a manner that cannot be attempted by less experienced contemporaries. Buying judiciously is the secret of half the success so much desired in business, and a careful study of the descriptive notices and advertisements in this issue will be found advantageous to the distant buyer, who will find in them something to suit all branches of the trades we represent in the numerous pages of business announcements that we this week send forth to our readers. Our advertisers are among the best houses in the trade, many of them having long experience in the filling of Colonial orders, and, knowing the requirements, may be depended on to satisfy the wants of purchasers; and here we would say that there is one thing that ought specially to be borne in mind; the cost of transit of good things is the same as that of bad. It costs no more to import the best goods than it does to import the worst. Therefore, be sure that you are dealing with firms that can be depended on to give value for money, and to act in their customers' interests as well as their own. Our aim, and we may hope that it is a successful one, is to bring together the right people at home and the right people abroad for mutual advantage and for mutual service, and our success in bringing together the Colonial buyer and the Home producer has more than justified our action in issuing these special export numbers, while at the same time it has increased our personal intimacy and correspondence with "our kin across the sea." We have referred above to the advertisements in the pages of this number, and in addition thereto we give an index to Home firms (that embraces the widest range of trade supplies) in our "Buyers' Guide," containing particulars of the manufactures of the leading houses. Our great object is to promote as much as possible a mutuality of interests, and our chief wish is to be useful to our clientele both at home and abroad.

* * *

A Great Field for Enterprise.

A REMARKABLE change in the attitude of home manufacturers towards Colonial consumers and customers has been taking place during the last few years. We refer more particularly to home manufacturers concerned with the printing and stationery interests—typefounders, ink makers, roller composition makers, engineers, papermakers, and cognate traders, and to their customers, the newspaper printers, the general printers, and the stationers of Britain beyond the seas. Formerly the Colonial market was, if not entirely ignored, regarded as of little importance. Then the possibilities of Colonial business was grasped, but America and other competitive countries also saw the rising market for their goods, and to-day the British trader has to face considerable competition in our own Colonies. Still the field of enterprise is an immense one, for a glance at the map of the world and the coloured streaks that mark British possessions will show what a market there is for our goods. The essentials are that traders must have a good article to sell, it must be adapted to the requirements of Colonial buyers, and it must be advertised judiciously and sufficiently, the last point is imperative, but our modesty prevents our dwelling on it.

* * *

Is Printing Profitable?

WE often hear complaints about the general unprofitableness of the printing business, and it is said that, considering the amount of money invested in plant, and the sums payable weekly as wages, no other industrial occupation brings in such inadequate returns. The remark, too, is common, that "low prices have ruined the trade," and that shortly no one will be able to make a living at it. We venture to say that the men who thus inveigh against the remunerativeness of the profession are mostly unsuccessful men, that is systematically unsuccessful; not as the result of a single ill-timed or ill-judged transaction. But, then, in every other trade or profession we find the same class of men, quite unfit to carry on their occupation after a profitable manner, and who, perhaps not unnaturally, declare it to be the worst that ever a man put his hand to. It does not require much exercise o the reasoning faculty to arrive at the conclusion that if what all these disappointed traders said were true, there would be no profitable trade at all, and that there are really profitable trades no one can deny. If we sift the subject properly, it is probable that we will find that the printing business is quite as remunera-

Digitized by Google

tive as any other, *if properly conducted*. And here is the real gist of the matter—if properly conducted. For instance, a business is not properly carried on with old, obsolete, worn-out machinery and plant. The wants of the trade a couple of decades ago are not the wants of the trade to-day. Where a run of 5,000 was considered a long one, runs of hundreds of thousands, or even millions, are now quite common, and a considerable cheapening of prices has taken place. How has this been brought about? By the employment of the best and most rapid machinery. It is of the first importance that the printer should advance with the times. If he holds back in the race, even for the shortest period, his place will be filled by some one who is more enterprising and wide awake. This is the Age of Machinery, the individuals who exercise the greatest influence on the destinies of their fellow-men are not kings or queens, emperors or presidents, but inventors and engineers, those who create new industries and invigorate old ones. He who makes two blades of grass to grow where only one grew before is said to be a benefactor of the species; how much more then the man, who, discovering a new process, or devising a new method, brings into existence a fresh department of industry and gives employment to perhaps thousands of his fellow beings. This is the era of new and improved machinery for facilitating the production of printed matter, and the printer of to-day has ready to his hand appliances that by their use should lead him on to fortune. The engineers are striving with each other as to which of them will put the best machines on the market. We have many new flat-beds, two-revolutions, perfectors, and rotaries of wonderful capacities, the aims of whose makers have been to assist the printer to turn out his work with speed and economy. We have, too, for economy in the composing-room, the Linotype, the Monotype, the Typograph, and other appliances for the speedy setting up of matter. All these improvements, if adopted and well handled, go far to make the printer's business a profitable one. To make money nowadays the printer must have his office fitted to meet the varied demands on its resources, and he must also have his wits in order to utilise to the utmost the appliances and opportunities in his possession.

The death is announced from America of Dr. Benjamin Eli Smith, managing editor of the "Century Dictionary" from 1889 to 1891 and general editor since 1894. He also edited allied publications, including the "Century Atlas."

The editor-in-chief of the *Morgenbladet*, Christiania, Mr. Nils Vogt, has resigned his position, his desire being to be able to devote more time to literary work of special interest to himself. The new editor of the *Morgenbladet* will be Mr. C. J. Hambro. The change will take place July 1st next.

An Example

of the many letters received every week from enthusiastic Linotype users.

Increased Work.

Speed in all Changes.

Standing Matter.

Avoids Overtime.

Anticipates Another Machine.

The Purchase Justified.

I am very pleased to say that since the installation of Linotype Model 4 Triplex Machine, the work has increased to such an extent that, without its many strong advantages, it could not have been undertaken. As it is, with the simplicity and quickness of change of body and measure, not to speak of the advantages of the Automatic Quadder, I have easily overcome the extra pressure. When I take into account that a large amount of the work at present in hand will have to stand for some time, and that this will be free from "pi," and not require any of the men picking various letters therefrom, it adds considerably to the value of the matter set. In fact, I don't know how I have done without the machine so long; but for it I would have been working overtime for weeks, whereas I have had no overtime at all. These facts give me every hope that, with the continuance of the present orders, I may ere long be compelled to consider the advisability of again placing an order with you for a machine similar to this with different body founts.

I should like to add that in every respect your points of recommendation in persuading me to purchase the machine have been fulfilled to the letter, whilst the courtesy and attention all through the transaction and afterwards have been most marked.

This is the experience of thousands of Linotype users. Linotype advantages are available to *every* Printer who permits himself to have them.

Trade Notes.

MESSRS. METHUEN are issuing a new Sevenpenny Library, in which popular novels will be issued at this popular price. A feature will be the "picture jackets" that will make their appearance attractive on the bookstall or in the window. Among the authors represented in the first batch are C. J. Cutcliffe-Hyne, Max Pemberton, Baring Gould, E. P. Oppenheim, Eden Phillpotts, and others.

THE dangers of celluloid eyeshades are exemplified in an accident that happened the other day to Mr. G. F. Hallock, associate editor of the Port Jefferson (N. Y.) *Echo*. He was wearing a celluloid shade over his eyes, while in the composing-room of the *Echo* office, and in lighting a cigar the shade caught fire with a slight explosion, burning his eyelashes and eyebrows entirely off and severely injuring the flesh. Mr. Hallock snatched the burning shade from his head in time to prevent serious injury to his eyes.

THE city of Dresden has a newspaper of its own, the property having been bequeathed to the municipality. In 1856, states the United States Consul, Dr. Justus Guentz, publisher of the *Dresdner Anzeiger*, and proprietor of an advertising bureau, with a concession from the Saxon Government known as the "Koenigliches Saechsisches Adresse-Comptoir," willed the bureau and the right of publishing the *Dresdner Anzeiger* as a special foundation for the common welfare, under the condition that the profits should be used for beautifying Dresden and for charitable purposes. The annual profit amounts to about £12,000.

THE ASHCROFT PAPER TESTERS AND THICKNESS GAUGES.—The latest development in paper testers is a small compact instrument $1\frac{1}{2}$ inches thick, $4\frac{3}{8}$ inches long, and $3\frac{3}{4}$ inches high, which is being marketed by the Ashcroft Manufacturing Co., of New York, well-known manufacturers of instruments of precision for over half-a-century. The paper tester is supplied in two grades, one for testing the strength of thick papers and the other for testing thin papers. In design the instrument is a radical departure from those now in general use, and it is claimed that it will remain accurate for many years without readjusting. The firm have also put on the market a gauge for testing the substance of paper and boards. The sole British agents are Messrs. H. B. Legge and Co., of 81, Cannon-street, London, E.C.

MR. G. T. SHAW, the city librarian of Liverpool, lectured the other night on "Public Libraries and their Work." After referring to the formation of subscription libraries in the eighteenth century, he mentioned that the first rate-supported library was established in Lancashire, the Public Libraries Act being introduced into Parliament by a Liverpool man, William Ewart. Liverpool obtained in 1852 a private Act which authorised the payment of lecturers as well as the establishment of libraries, though the free lectures were not commenced at the Picton Hall till 1886. The lecturer described at some length the arrangements and working of the Liverpool Corporation libraries, and compared them with those of other towns, among the points dealt with being the provision of reading-rooms for students and for children, and of books for the blind. He also spoke of the effort now being made, and estimated to occupy six years, to form a single catalogue of the 160,000 volumes of the reference library.

NEWSPAPERS AND BOOKS.—Addressing the Hampstead Subscription Library and Literary Society on "Newspapers and Books," Mr. Richard Whiteing said, there were good and bad newspapers; but what struck him most was the immense preponderance of good ones. He did not except the much disparaged half-penny paper, which he thought in its average was a most astonishing and most helpful thing. It was impossible to exaggerate the part the newspaper played in life, and difficult to exaggerate the care, skill and judgment that went to make one. And he felt very strongly, Mr. Whiteing added, about what he would call the ignorant disparagement of the newspaper. With all its errors, the work was so well done that he felt extremely impatient of anything said in disparagement of it. The book was essential, because the more they multiplied experiences of the raw material of their epic of life, as found in the newspapers, the more they needed some co-ordinating power that would show them some completeness in the great mass of events. That was the glorious function of the book, rightly understood. But the book had not filled the rôle of the newspaper in making itself accessible; its price was prohibitive.

THE death has taken place at New York, of Mr. Howard N. Thompson, formerly a journalist with a European reputation.

AMONG the additions to the British Museum to be opened shortly there will be a "journal room," in which will be placed the chief periodicals of the world. Each journal will be available as soon as possible after publication. The use of the journal room will be restricted to the holders of readers' tickets.

Testing the Standards.

The printer's engineer, the typefounder, matrix punch cutter, and others who have to deal with fine measurements in their daily work, should be interested in the report of the Board of Trade upon the administration of the Weights and Measures Acts, as it includes a report by the Deputy Warden of the Standards upon the tests of the several Parliamentary copies of the Imperial standard yard and the Imperial standard pound made last year. The standard yard and its copies are made of a bronze alloy. The standard pound and its copies are made of platinum. The results of the yard tests show the following differences between the copies:—Royal Mint copy, 23 millionths of an inch short of the standard; Royal Society copy, 49 millionths of an inch short; Greenwich Observatory copy, 43 millionths of an inch short; Standard Department copy, 215 millionths of an inch short. A comparative table shows the interesting fact that the Mint copy has lengthened by one millionth of an inch, the Royal Society copy has lengthened by 47 millionths of an inch, the Observatory copy has lengthened by 42 millionths of an inch, and the Standards Department copy has shortened by 23 millionths of an inch during 10 years, The tests of the pound weight show the following differences:—The Royal Mint copy is 364 hundred-thousandths of a grain heavier than the standard, the Royal Society copy is 68 hundred-thousandths of a grain heavier; the Greenwich Observatory copy is 84 hundred-thousandths of a grain lighter, the Standards Department copy is 261 hundred-thousandths of a grain lighter. In this case the changes during the past 10 years have been:—An addition of 18 hundred-thousandths of a grain in weight to the Mint copy, a loss of 6 hundred-thousandths of a grain in weight in the Royal Society copy, an addition of 79 hundred-thousandths of a grain in weight to the Observatory copy, an addition of 23 hundred-thousandths of a grain in weight to the Standard Department copy.

All Work, No Profit.

A writer in the *American Bulletin* says that:—While the large print shop is adopting all kinds of time-slips, cost-blanks, index systems, time recording clocks, and the thousand and one systems of keeping tab on each job and each workman, and can tell in an instant just how long each process of handling a piece of work required, and whether or not the estimate was conducive of profit, the proprietor of the small shop stands still—absolutely still. Apparently he is content to guess as to his business profits; should he have sufficient money to pay the men when Saturday comes around, and a small surplus for his Sunday cigars, he knows he has at least made some profit, and it will be a week before the pay-day bogie again makes him scratch the place where his hair used to be. But often he would gladly welcome some system of elastic currency which would enable him to overcome the deficiency which has become apparent at the completion of some—to him—large job. He had "guessed" that thirty hours would be ample time for the setting of the type, and while the men had worked industriously and hard, yet this guess proved wrong—far wrong. He is sure that he personally could have made better time, and wishes competition would have permitted him to add further leeway, but he had to trust his men to make time for him, and this they did not do. So he sighs a great big sigh and wonders what can be the reason.

Apparently he is content—but only apparently. While his men are sleeping the refreshing sleep of the just, he is often pacing the floor, revolving plan after plan, scheme after scheme, in his effort to locate the difficulty. Occasionally it occurs to him that had the men more material they would be able to finish work faster; but, hoopsnake-like, he must make larger profits to enable him to get this material, and to make larger profits he must turn the work out faster, and to turn the work out faster he must have more material. And thus his revolvings revolve. Any way he looks at the problem he follows the circle back to the starting point. How others do it is a mystery to him. His own case seems helpless.

The pursuance of a fallacy will always remain pursuance; and a fallacy will never be anything else. Nothing but a radical change will avail much that is different, and as matters are clearly at rock bottom now, a change must come, and should come sufficiently ahead of the sheriff to be given a fair chance to prove its merit.

Now, Mr. Small Printer, you have a good run of trade, have several good men in your employ, and should make money. But you don't. Let's see what your predicament looks like through eyes other than your own. We'll take a walk through your composing-room and see the conditions under which your men work, and perhaps we'll find sufficient reason for the dilatory aspect of each job. Don't be surprised if I scold you and prove to you that 90 per cent. of the fault is your own. I've got you now where you'll have to listen, and I'm going to talk to you as I think you should be talked to.

There's a man pulling out case after case; he's been walking around quite a while now, and doubtless has but little accomplished. Something's wrong—let's see what his trouble is. "Can't find a twelve-point quad anywhere!" replies the "comp" when questioned. Now, isn't this a nice condition, to start off with? Not a twelve-point quad anywhere! But, however, we'll go further.

Here is a job with sorts missing, and all the leads and slugs pulled out—the loose string alone saves it from being a mass of pi. And here's another the same way! And another! Gracious, man, all on this bank seem to be in the same condition! Right here you deserve the severest kind of scolding, and should get it; but we'll go further.

Snip, snip, snip! What's that man cutting with the scissors? Cardboard and paper for justifying! Justifying what? Can it be possible that he is compelled to use type bodies not on the point system? Well, well; and this in the twentieth century! However, we'll pass him and look around some more.

That man on the stone has just placed some blotter on each side of the job he is locking up; why in the name of goodness does he do this? You don't mean to tell me that the composition is so bad as to require this! Surely you haven't permitted the men from time to time to cut your labour-saving material! And yet this must be the case, for there stands a man at the lead cutter now—chop, chop, chop; cutting some standard size to suit his job, perhaps into some odd measure. Why, look! your lead cutter is not graduated to picas or nonpareils! Let's pass him quickly, before I do something harsh to him.

What's the stoneman now cutting with that dull saw? Furniture to lock up his form! And yet you wonder it takes them so long! Snip, snip; chop, chop; zizz, zizz! Day after day all new stuff you buy is cut, smaller, smaller, smaller, until after a while it blows away at the least draught. But enough of this; the problem is clearing. Let's see the material the men work with.

All these dingy cabinets, and these tall racks of cases—what do they contain? Type faces that you haven't used for a long while, but can't discard for fear of being needed! Nonsense! When did you last use this two-line small pica shaded letter? Can't remember? You bet you can't. And further, you know you'll never use it again. Really every face in this entire cabinet is so obsolete that the men never open it. What use is the entire lot anyway? And this rack—each case pulled out discloses old faces covered with dust; have any of your men during the last decade used any of this stuff? If so, you can rest assured it was by force of necessity, or through desperation, and not because typographic style demanded it. And this lot of ornaments and borders, not one of them has been touched for years, and not one of them will be touched for years to come. "Comps" will come and go, but one look at this mass of junk will suffice them, and each and all will pass it by. Further, your customer is educated to good printing, and wouldn't have this old stuff twice if you did use it. Doubtless he wouldn't accept the job if you dared use it at all.

Messrs. H. O. Strong and Sons, Ltd., Norfolk Works, St. Paul's, Bristol, a firm of manufacturers of machines and tools for printers established since 1877, have issued a very neat and compact little catalogue of their specialities, the illustrations in which are printed in chocolate and the letterpress in green ink. There is a brief article on cutters preparing some illustrations of their stock designs, and other contents relate to blocking and embossing presses, bookbinders' presses, eyeletting machines, guillotines and guillotine knives, knife grinding, the "Swift" maturing machine, the "Bear" punch, the "Dreadnought" punch, punching machines, relief stamping presses, and the "Strong" round-cornering machine. In addition to this there are some illustrations of the Norfolk Works exterior and interior, and some particulars as to terms of business. The book, which measures 8½ by 5½ inches, is strongly bound in stiff dark green paper boards.

The New York Master Printers' Association has developed among its members and the trade generally an interest in organisation and co-operation, which is the healthiest sign of the need and value of such an institution. The monthly meetings are remarkable for the prevailing spirit of good fellowship, and for the fact that printers of varied individual interests, whose problems, perhaps, are often widely scattered, find a common gathering place in the Association rooms. The attendance is larger at each meeting than that of the previous month, and there are many members who feel that they cannot possibly afford to miss a single meeting. This Association has won and maintained the interest and attention of some of the best printers in Greater New York.

A new weekly journal, entitled the *New Statesman*, is announced. It is to be published under the editorship of Mr. and Mrs. Sidney Webb.

Inks which really suit each climate

That is what Kidd's Ink Service means to the printer abroad. It is no figure of speech, but a positive fact—the outcome of direct personal knowledge. Whether your business is in Canada or Australia, India or South Africa, or any other country which owns allegiance to King George V., you will find within easy distance one or more of Kidd's Agents well stocked with printing inks which will exactly suit your needs and packed just in the quantities you require. And it is well worth noting that Kidd's Inks have the reputation of being value for money—always, and Britain's best.

JOHN KIDD & CO., LTD.,

Ink to Write on Black Paper.

This ink is very useful for writing on some kinds of show cards and tickets for labelling collections. The writing is very clear and something out of the ordinary. The ink can be made very easily. A very thin mixture is first prepared with 100 parts of water and 5 to 20 ozs. gum arabic. Then, in this liquid, a light white powder (levigated chalk, or starch preferred) is triterated. The ink is now complete, and can be used with pen or brush. It should always be well shaken before use. Very clear white lines are obtained on all kinds of dark paper besides black. Chalk is better than starch, as the latter only turns white when dry. Avoid white powders, which do not cover well and give pale lines (talc, kaolin, zinc oxide, lithopone), or which are too heavy and give a sediment (white lead, permanent white). The proportions are very approximate, and practically no measurements can be made. The ink can be effaced by washing it with a hair pencil and the writing thus retouched. If the cards have to resist the effects of rubbing, they must be finally sprayed over with a little copal varnish containing a small quantity of alcohol.—*La Nature.*

Royal Prussian Testing Institute.

The Annual Report.

The annual report of the Royal Prussian Testing Institute, at Berlin-Lichterfeld West, for the year April, 1911-12, is to hand in the form of a 4to pamphlet of 74 pages. The institute comprises six departments, under the heads of metals, building materials, paper and textiles, metallography, general chemistry, oils. In these laboratories the work of testing materials, judicial *expertises*, and the elucidation of technical difficulties is undertaken primarily on behalf of Government and public bodies, but secondarily also for private firms and individuals.

Department 3, for paper and textiles, is under the direction of Professor Herzberg, well known in this country as the leading expert in paper technology. Being connected with the Technical High School of Berlin, it has hitherto been the custom for the Institute to take in a limited number of students for testing work, but so far as Department 3 is concerned this practice has had to be suspended owing to the unexpected increase in the routine work of the department. The German Papermakers' Association has petitioned the Government to make arrangements which will enable the educational work of the department to be resumed as soon as possible.

During the year 1,559 samples of paper and nearly 100 samples of boards, half-stuffs and other papermaking materials have been tested. The proportion of work received from public bodies as compared with private firms was a little more than half. With regard to the papers, the great bulk of the testing related to the composition and strength, in order to ascertain whether these properties complied with the normal specifications drawn up for papers to be used for specified purposes. In the case of the samples of wood pulp and other half-stuffs the tests related to the length of fibre, proportions of shive, resin, ash and reducing constituents.

Short notes are given in the report recounting certain individual problems of interest investigated during the year. In a law suit a document was submitted from the court for an opinion as to whether it was written prior to the year 1878, or whether it was a later fabrication. It was impossible to pronounce a definite opinion on this point either from examination of the paper or the ink. Certain brown specks on the document which were thought to be indicative of its age were, however, certified to consist of some foreign brown powder, apparently brick dust. At the request of a meterological observatory, the experts of the Institute were able to recommend a special paper suitable for registering the duration of bright sunshine by charring under the heat concentrated by a powerful lens. A safety cheque paper was submitted to the Institute, which on treatment with acids, gave a blue coloration, and with alkalis or oxidising agents a brown. Writing on this paper could be removed by means of oxalic acid and bleaching liquor, but the treated places retained a brown stain, thus confirming the claims of the manufacturers.

Out of over 1,000 papers submitted by public offices, 91·3 per cent. conformed with the standard specifications, whilst the remainder fell short only in a minor degree. This is a very satisfactory result.

Finally may be mentioned the experiments carried out by the Institute on the preservation of manuscript documents. The treatment with "Cellite" varnish, previously recommended, has maintained its satisfactory position, particularly the increase in strength and pliability thereby imparted to the documents is a cause for much satisfaction.

After all Permink is the only genuine Pen Carbon Paper which gives Universal Satisfaction!! All wise Stationers Stock it

THE undermentioned candidates have been awarded trade scholarships at the L.C.C. Central School of Arts and Crafts—Book Production. The scholarships are tenable for three years, with maintenance grants of £6 for the first year, £6 for the second year, and £15 for the third year:—Arthur T. Blunsum, Leonard A. Burlace, George E. Drew, Arthur A. Dudley, William L. Hayward, George F. L. James, Walter D. Peers, Leonard T. Read, Edward Webb, Herbert W. Willmott.

Delivering Sheets.

In an invention by Messrs. C. Mayer and F. Trautmann, a stand or table for supporting the laying-out trays with the freshly printed sheets from a printing press, arranged so that the tray receiving the sheets is at a fixed working level, comprises a frame *g* having two fixed table *a*¹ and bearings *l* for supporting four vertical screws *d*. Supported on the screws *d* is a frame *b*, on which are two rails *e* to accommodate rollers *r* on a table *a*. The screws *d* are connected by an endless chain *t* which can be tensioned by a pulley *s*. After a small pile of sheets has been delivered on to the table *a*, a tray *f* is withdrawn from beneath the table and placed over the pile, the table *a* being lowered a distance equal to the thickness of a tray by turing the screws *d* by means of a key applied to the squared end

of one of them. The operation is continued until all the trays are supported on the table *a*, which is then run out on the rollers *r* on to a truck having rails aligning with the rails *e*. In a modification, the table *a* is supported on cranked arms which engage the screws *d* so that the table can be lowered to the floor level, and the screws *d* interconnected at the top so that the *a* with its trays can be run straight out without the use of a truck. In a further modification, the table for supporting the pile of trays is suspended from four chains which pass over sprocket-wheels on an horizontal shaft, which is turned to raise or lower the table by a handle with a spring bolt which engages a notched disc on the shaft. The lower tray is furnished with rollers so that the pile can be removed without the use of a separate truck.

Mr. Cecil B. Johnson (Ben Johnson's), York: The men like it (the costing system). . . The foremen like it. . . The management like it. . . The travellers like it. . . The directors like it, because the **profits are larger and the anxiety is less,** while the fact that our turnover has increased steadily since the system was installed proves that our customers like it. (At the Costing Congress.)

Plant Values and the Costing System

The Costing Congress has urged that the standard unit of production of printing shall be **the hour** (or a unit of piece work like 1,000 ens). This unit shall comprise the whole cost—everything but profit. Each department shall have its accounts kept as if it were an independent business. We must get at the hour cost—or piece unit cost—of each department.

Therefore, for each department, before we can fix the correct hour cost, we want first the wages and second the whole departmental cost, and for that second part we have to arrive at the proper apportionment of many different things, rent, rates, light, heat, power, depreciation——

Stop there a moment. **Depreciation.**

On that Mr. Howard Hazell, the spokesman for the Costing Committee of the Masters' Federation, said in his main exposition that depreciation is a thing the printer often overlooks. "You will find the different values of your plant," Mr. Hazell proceeded, as he was explaining how to get at the unit hour cost, "from your inventory, if you have an inventory."

Have you an inventory? Complete? Up-to-date? Are there things it would cost you much to replace and which you yet cannot say are certainly included somewhere in your books or papers?

Start your costing system right. Get an inventory made. With that and your other items of last year's expenses you can then attach a very closely correct amount to each department as its departmental cost, and when you have added the percentage for recovery of the overhead expenses on the plan advised by the Costing Committee (finding, *i.e.*, what percentage they are of the combined wages plus departmental costs) . . . you have gone far towards making Mr. Johnson's experience at York also your own.

An independent inventory practically also transfers the onus of proof from you to any fire office or any party who might conceivably have an interest in belittling value. Let, then, the question as to what would be needed to replace your plant and equipment in their present condition on the open market be answered item by item in a detailed fully priced inventory, prepared by

TO TRADE BOOKBINDERS, BOOKBINDERS' PLANT AND MATERIAL MANUFACTURERS AND DEALERS, PUBLISHERS, LIBRARIANS, AND OTHERS INTERESTED IN THE BOOKBINDING INDUSTRY.

THE Publishers of the *BRITISH AND COLONIAL PRINTER AND STATIONER* have pleasure in announcing that an ILLUSTRATED MONTHLY SECTION of that journal is now devoted to matter concerning the BOOKBINDING TRADES.

All branches of bookbinding are dealt with, from practical and technical standpoints, and the historical and artistic aspects of the industry also receive attention. Illustrations of hand-tooled bookbindings and publishers' cases which are remarkable for their artistic design, their historic interest, or their novel character are presented from time to time.

The BOOKBINDING SECTION appeals to all those who are interested in bookbinding, whether as a trade or as an art, as all phases of the subject receive their due share of attention in its columns.

The Editor will welcome any news of trade interest that may be sent him, and is prepared to consider original articles of a technical and practical character, with a view to their publication. Information concerning the working of the technical classes in bookbinding, and notices of meetings of trade unions and other bodies associated with the bookbinding industry, are also invited; arrangements can usually be made, if desired, to report the latter, as well as lectures, etc., for the BOOKBINDING SECTION. Illustrations and particulars of new machinery and appliances, and information concerning new materials and methods for use in the trade, are likewise of interest. The publishers having no end to serve save the presentation of matter of value to the various branches of the trade, the pages of the BOOKBINDING SECTION are open to all, employers and employed, unionists and non-unionists, for the free discussion of trade matters.

As far as READERS are concerned, copies of those issues of the *British and Colonial Printer and Stationer* that contain the BOOKBINDING SECTION will be sent regularly on application, at special rates.

With regard to ADVERTISEMENTS, the bookbinding trade announcements are placed in a POSITION NEXT TO OR FACING READING MATTER in the BOOKBINDING SECTION. ADVERTISING RATES sent on application. Arrangements have been made to circulate the journal in quarters likely to be most productive to advertisers of a return for their outlay, and no effort is spared to study the interests of advertisers and readers alike.

Orders for advertisements in and subscriptions to the BOOKBINDING NUMBERS of the *British and Colonial Printer and Stationer* should be addressed to the publishers:—

All-Size and Colour Rotaries.

Seeing that rotary printing machines have lately been coming into very extensive use, the particulars given below may be of general interest. We recently referred to a rotary brought out by Messrs. H. Nedden and Co., 11-12, Finsbury-square, E.C., and now illustrate herewith another machine of the same class brought out by the same firm, which shows better even than the one we have already noticed the adaptability of rotary machines to the manifold demands made upon printers to cope with long runs of printing in a limited space of time. Most rotary printing machines, as printers are aware, are built for one particular kind of work only, being more or less useless for work of a varied character. The average printer, therefore, hesitates to install one through fear of not being able to keep it going, preferring

An All-Size Colour Rotary.

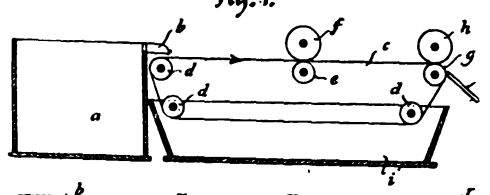
to keep to the ordinary flat-bed machine, which, by its slow movements, handicaps him severely when it comes to long runs, whilst a rotary printing machine would give him from three to four times the output of the flat-bed machine, even when fitted with a modern automatic feeder. On the machine forming the subject of this notice the paper may be printed either in one or two colours on one side, or in one colour on both sides, all that is necessary being the simple alteration of a gear wheel. Further, the paper may either be cut and delivered in sheets or re-reeled after having been printed. The advantages of this will be obvious, particularly in view of the fact that a rotary machine has hitherto been regarded as being suitable for one kind of work only.

The re-reeling attachment will also be found to be a very useful attribute of the machine in view of the ever-increasing demand for paper in reels. Wrapping paper for instance is often supplied in reels, and used either on wrapping machines, or pieces of the desired size are cut off as required. Also strips of gummed paper coming from a reel are extensively used for sealing parcels. Many firms, as is well known, are desirous of having some kind of printing or advertisement appear on these reels, but are not able to have this done on account of printers not having suitable machinery for having such paper printed and re-reeled. Here, however, the re-reeling attachment is an alternative to the ordinary sheet delivery, and an integral part of the machine.

In the matter of price also, we are given to understand this machine is on the whole no more expensive than a flat-bed machine with the necessary feeder, requiring moreover less attention, and giving a greater output. The machines are made for standard sizes of paper or to special requirements.

It is of course impossible to go into the many merits of this machine in the limited space at our disposal, but further particulars can be supplied on application to Messrs. H. Nedden and Co., at the address given.

CO-OPERATIVE PRINTING.—The Co-operative Wholesale Society, which had a trading turnover for the past six months of £15,830,886, has three printing works the total supplies from which for the past half year amounted to £106,062, showing an increase of £3,135 or 3 per cent. on the corresponding period a year before. At the Longsight (Manchester) works the supplies were £81,005 and the profit £1,118; at the Leicester works the supplies were £12,046 and the profit £635, and from the Pelaw-on-Tyne printing works the supplies were £11,063 and the profit £257. To cope with the business that is developed both in printing and box-making at Leicester the committee have purchased 431 square yards of land at the rear of their present works, for extensions.



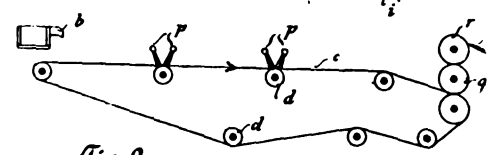
Treatment of Waste Paper.

An English patent has been granted to Mr. Carl Kurtz-Hähnle, of Reutlingen, covering a process of producing pulp from paper printed or written upon, a saving in chemicals being claimed over existing methods.

The old raw materials are first soaked with diluted lye, until the connection between the paper and the colour or ink is sufficiently loosened, then subjected to a light pressure for squeezing out the superfluous liquid. The materials received from the tank *a* (Fig. 1) through the overflow spout *b* are delivered on to an endless conveying sieve *c*, which runs over the guide rollers *d* and carries the materials between the pairs of rollers *e*, *f* and *g*, *h*, which press out the superfluous lye. The squeezing rollers *f*, *h* are only lightly loaded The pressed out lye collects in the tank *i* placed below the sieve *c* and may be used again. The materials themselves reach a delivery board *k* from which they are removed for further treatment. This delivery board *k* may be connected with a vat *l* (Fig. 3) in the pipe-shaped part l^x of which is a rotating conveyer screw *m*, the pitch of which decreases towards its upper end. Below the perforated inclined bottom *n* of the conveying pipe l_x is arranged a suitable gutter *o* for conveying the superfluous liquid out of the vat *l*.

The material treated in the manner above-described is then put into a suitable vessel

Fig. 1.



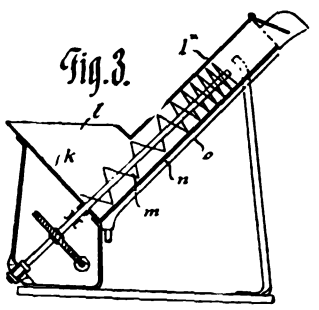


Fig. 2.

Fig. 3.

and a convenient quantity of water is introduced, whereupon the material is reduced to fibres by means of beaters or agitators, so that the printer's and other similar inks gradually separate from the fibres. Agitating apparatus of any improved construction capable of finely dividing the material by means of rotary agitators or beaters may be employed.

In order to free the fibrous mass from the loosened impurities, it is now passed on to an endless sieve of fine wire-gauze *c* (Fig. 2) passing therewith over the rollers *d* and beneath sprinklers *p*, so that the sprays of water from the latter can carry off the impurities. At the delivery end of the sieve the completely cleaned fibrous mass is passed between couching rollers *q*, and is carried up by them to the roller *r* from which it is removed by the scraper *s*, and allowed to fall out.

According to the patentee, the process can be carried out continuously, even for the largest quantities, and requires but small quantities of chemicals and small outlays for wages and driving power, so that it can be employed most advantageously for all sorts of old paper, including paper of the lowest quality.

The lye employed in the process consists preferably of a solution of sodium peroxide, or of the peroxide of an alkaline earth such as magnesium peroxide for example, and colloid silicic acid of about one per cent. strength. A suitable solution of one per cent. strength is made by adding one kilogramme of the combined chemicals to 100 litres of water, the one kilogramme being composed of 30 grammes of sodium peroxide and 970 grammes of colloid silicic acid. Of course the proportions differ according to the strength of the colloid silicic acid, but instead of the above-mentioned alkaline solutions other chemical agents, which produce a similar effect of dissolving ink or colour from the paper, may be employed. For the selection of the chemical agent it is always essential that the chemical be capable of producing a sufficient effect upon the paper to be cleaned, or upon the impurities to be removed without altering the paper mass to a degree which exceeds the absolute necessity.

The Best Investment you can make for the YEAR is to install a

Davis Typecaster

THIS simple machine is the greatest source of economy offered to the Printing Trade in recent years. It enables any printer, on a very small outlay, to cast ALL his type, spaces and quads, in ANY face and ANY body size from 3 to 30 point, at an average cost of ***less than half typefounders' prices.***

The leading firms all over the Kingdom are installing the DAVIS TYPECASTER and saving half their type bills. Write or 'phone us.

OUR Buyers' Guide TO THE Export Markets FOR THE

PRINTING, STATIONERY, PAPER, BOOKBINDING, BOOK-MAKING AND ALLIED TRADES, IMPORTERS, AND COLONIAL STORES.

A Useful GUIDE for COLONIAL and FOREIGN BUYERS.

Up-to-Date.

PRINTERS' ENGINEERS AND PRINTING MACHINE MAKERS.

Albert and Co. Act.-Ges., Frankenthal, Germany.—This is one of the largest firms in the world of printers' engineers, and their manufactures are well known in all countries. Everything is made, from a platen press to a newspaper rotary, including high-art, two-revolution, collotype, tinplate, and litho machines. The firm's work is of the highest class, and a number of improvements have just been made in their colour presses, which include All-Size rotaries and rotaries that print in from two to six colours and do the finest half-tone illustrative work. Mr. Adolf Bartzack, Paternoster House, 34, Paternoster-row, E.C., is the London agent, and the firm has branches at Paris, St. Petersburg, Moscow, Odessa, Warsaw, Milan, Madrid, Budapest, Stockholm, Christiania, Copenhagen, Amsterdam and Brussels.

The Canadian-American Machinery Company, Limited, 8, Bouverie-street, London, E.C., are the general concessionnaires of the Walkup Rotary Press Feeder for changing the reels on a rotary press, either individually or simultaneously without stopping the press, saving time, spoils, space and power. Among the leading agencies in this firm's hands is that of the Brown and Carver (Oswego) Cutters, which are made in 90 different styles and sizes from the 16-in. bench cutter up to the 84-in. Automatic Clamp Cutter weighing nine tons. Also that of the Meisel Printing Press and Manufacturing Co., who make presses for printing, numbering, perforating and folding, counter cash sales and manifold books, Bed and Platen presses for printing tissue, gummed, waxed, and other papers from type or plates, delivering any size sheets or rewinding the printed product, ticket presses for street-car and strip tickets, trading stamps, etc. Slitters and rewinders for slitting wrapping paper and toilet requisites, and centre winding machines for tag or cardboard stock, rewinding up to 40-in. in diameter. They are manufacturers of the British Newspaper and Job Folders for folding, insetting and trimming at head 4, 6, 8, 10, 12 newspapers and upwards, turning same out with all the appearance of having been printed on a rotary press, and this at a guaranteed speed of 2,000 per hour and upwards. They manufacture Roller Washing machines for letterpress rollers, and Graining and Washing machines for lithographic and offset press rollers, and handle the Galley Cutters and Creasers of the platen type made in five sizes from 20-in. to 30-in. up to the Mammoth 30-in. by 44-in. inside chase, and have introduced a heavy Drum Cylinder Cutter and Creaser, capable of cutting and creasing boards up to 28-in. by 45-in., at a speed of 1,400 sheets per hour, with smaller sizes speedier in proportion.

The District Engineering Co., Florence-road, Upton-park, London, E., make a specialty of brazing cast iron. The process is a means of uniting broken or fractured iron castings, and restoring them to their original strength at a very reasonable cost. In some cases where several new castings have broken in succession (owing to the fact that they are not strong enough to resist the strain put upon them), mild steel can be reinforced, making the casting much stronger without obstruction. It might be an advantage to printers and the allied trades (like machinery users in other industries) to know that there is no need to have machines standing idle while a new casting is coming from abroad, or to scrap an out-of-date machine, on which good work can be done, because a broken casting on same can only be replaced by a new one at a very great expense. Such parts as cylinders, racks, brackets, side frames, roller brackets, presses, guillotines, pumps, cranes, etc., etc., can be repaired by this process, effecting a saving of both time and money.

Duplex Printing Press Co., Zurich, Switzerland.—The particular appliance made by this firm is the Swiss Duplex Flat-Bed Rotary for newspaper work. By its use the cost of stereotyping is saved, and it is capable of delivering, direct from type forms 5,500 to 6,000 complete copies per hour of a four, six or eight-page paper, folded and counted. For newspapers of medium circulation it is claimed to be a most economical machine.

Elliott and Co. (Otley), Ltd., Steel Croft Works, Otley, Yorks.—One of the famous firms of printing machine builders of this home of British printers' engineers. Their improved make of Wharfedale is well known in the trade, and the firm is now manufacturing printing machinery with clean printed side up delivery to suit progressive ideas. Messrs. Elliott and Co. claim the honour of producing the first two-revolution machine built at Otley, and their new "Caradoc" stop cylinder, and the "Elliott" two-revolution press are their leading lines to-day. The latter machine is of high-class design and construction, and even while running at a rate of nearly 2,000 an hour, is all that can be desired. The toothed-gearing is all cut by accurate machinery, the inking is specially excellent, and many improvements have been introduced that tend to perfection of printing. As a testimony to its quality, we may note that one firm of printers have five presses in use, and have ordered others. The latest addition to Messrs. Elliott and Co.'s machines is the "Elliott Auto-Wharfe," that combines feeder and machine in one, and is the first of its class to be offered to the printer. As a labour-saver this press should prove a success. The firm also manufactures self-clamp and other guillotines, bookbinding and other appliances. The managing director is Mr. Robert Elliott, a gentleman who has had a thorough practical training in the construction of modern printing machinery.

Messrs. A. Edler and Co., Bath-place, Rivington-street, London, E.C., handle many high-class special machines for the printing and allied trades. Among their leading specialities are rotary letterpress machines for commercial work. These are suitable for practically any class and quality of paper, including tissue, and the output in many cases amounts to quite 6,000 sheets per hour. In their showrooms they have some of the most modern machinery, including the latest book-sewing machines. Their "Victory" Book Sewer can be fitted with a new patented appliance for automatically folding and sewing continuous guards in one operation. They are the sole agents for the well-known litho and collotype machine works of Faber and Schleicher, Ltd., Offenbach, and also of the famous Typecasting Machine works of Messrs. Foucher, of Paris. A long illustrated notice of the firm's new premises appeared in our issue of March 21st, 1912.

The Goss Printing Press Company of England, Ltd., 53, Fleet-street, London, E.C. Works: Hayes, Middlesex.—This is the British branch of the well-known Goss Printing Press Co., of Chicago, U.S.A., whose fast newspaper presses are known throughout the world. The "Straight-Line" printing machines made by the firm can be adapted to the requirements of any newspaper office, and their Patent Straight-Line Low Down Central Folder Quadruple Machine will print in book form a 16-pp. newspaper at the rate of 40,000 per hour. A feature of the machines is the absence of angle turning bars. The Goss presses are in many British newspaper offices, and the *News of the World* has installed a 64-plate Straight-Line Goss Press to insert 16-pp. without turning bars. Other machines are turned out by the firm that are well worth the notice of the newspaper publishers who desire to improve their half-tone block printing. A notice of the firm's British works appeared in our issue of March 23rd, 1911.

R. Hoe and Co., Ltd., Mansfield-street, Borough-road, London, S.E.—The name of Hoe and Co. will always be associated with the greatest inventions in the way of typographical engineering that the world has witnessed, and in a brief notice, such as this, of their productions, but a very few can be mentioned. Their latest achievement is the marvellous Double Octuple Rotary Perfecting Press, which has a capacity of considerably over 200,000 finished newspapers per hour, all inset, pasted, cut and folded, with cover and centre pages printed in several colours. The "Sextuple Presses" print either in one or more colours, and in many combinations of pages. The "X" pattern Quadruple Press, runs at a speed of 48,000 4, 6, or 8 pages; 24,000 12, 14 or 16 pages; or 12,000 20 or 24 pages per hour, folded, counted and pasted. Another press prints and folds 96,000 two-page supplements, or 48,000 four-page papers, or 24,000 eight-page papers per hour. These are machines using a double width roll of paper. Other machines, having a single roll, print and fold four or six-page papers at 24,000, and eight or twelve-page papers at 12,000 copies per hour, the supplements being insetted, and, if desired, pasted in as they pass through the machine. The firm does not confine itself to newspaper machines only, but supplies fast machines of improved design for journals having moderate circulations and limited resources. Flat-bed and two-revolution cylinder presses are also made, and stereotyping, and other appliances are constructed to meet the most exacting requirements of the newspaper or magazine printer.

Peter Hooker, Ltd., Blackhorse-lane, Walthamstow, E.—This firm have a ticket printing machine which represents a great advance upon the older Lewthwaite machines, upon whose principles it is based. The machine automatically feeds and delivers 10,000 to 12,000 tickets an hour, printed in one or more colours on both sides, and consecutively numbered.

The Lanston Monotype Corporation, Ltd., 43, Fetter-lane, London, E.C. Works at Horley.—This firm is introducing to the printing trade of Great Britain, the Colonies, and the European continent the Monotype Composing Machine, an apparatus that casts and sets up the types entirely automatically from reels of perforated paper prepared on specially constructed keyboards. The types are cast singly, and placed on galleys in their proper order, and the type can, when printed from, be used again in the ordinary manner, or thrown into the melting pot and recast, which is the most convenient method. Many important improvements have lately been made that place the Monotype in the front rank. A number of labour-saving machines and appliances for the printer are also handled, including the well-known Harris Rotary Presses, the latest addition to which is the Harris Rotary Offset Press, a machine that will revolutionise the present methods of lithographic printing.

The P. Lawrence Printing Machinery Co., Ltd, 57, Shoe-lane, London, E.C.—This concern has for a great many years sold the "Colt's Armory" presses, manufactured by the John Thomson Press Co. They are the sole agents for the platen presses manufactured by this company, including their Cutting and Scoring, Printing and Embossing presses, which have a world-wide reputation and are used by practically all the progressive and up-to-date printers in Great Britain, the United States and elsewhere. Various sizes and styles of these machines are kept in stock in the Shoe-lane show-room, where they may be seen in operation. They also have on exhibition their latest platen machine called the "Laureate." This is an entirely new machine with many wholly new movements, and will print with one inking forms that heretofore have required double rolling. The machine has four form rollers, operated without cams, the throw-off may be operated with one finger, and reciprocating ink cylinders act directly on form rollers. The firm are the exclusive agents for the new Hodgman Cylinder press manufactured by Huber-Hodgman Printing Press Co., the construction of which is of such an advanced character that it is practically in a class by itself. The company also represents the Thomson Typecasting machine, which excels in many ways in casting individual type. This appliance casts type in sizes from six to forty-eight points. The company also sell labour-saving metal furniture and blocks with adjustable hooks, valuable for making register easily in printing three-colour work, as also for book and general plate printing. They are agents also for the Oswego Cutting Machine.

Linotype and Machinery Ltd., 188-189, Fleet-street, London, E.C.—This firm, which is an amalgamation of the Linotype Co., Ltd., and the Machinery Trust, Ltd., are the manufacturers of the Linotype Composing Machine, now so universally used in all parts of the civilised world. The Linotype is constructed at the firm's extensive works at Broadheath, near Manchester, where also is made the celebrated "Miehle" letterpress printing ma-

Digitized by Google

chine that is so much appreciated by printers for doing the best illustrated and other work at a high speed. Another machine is the "Centurette," a small sized two-revolution press, embodying the best features of the well-known "Miehle" and "Century" presses. It is extremely popular in the printing trade, on account of its moderate price, its high speed, and efficiency. It has already been ordered by some of the leading houses at home and abroad, and may be seen in operation at the Fleet-street show-rooms. One of the introductions of the company is the "L and M" rotary press for litho printing from metal plates, a first-class, reliable, up-to-date machine that produces the finest work at a speed that is much in advance of what can be obtained on the fastest flat-bed litho press. The "Autoplate," a machine for the rapid stereotyping of newspapers, is also made by the firm, and they supply everything in the way of machinery that can be needed by the printer. A system of coupling up Miehle Presses for colour work, in tandem fashion, and an arrangement for transforming a letter-press machine into a litho machine, have been introduced. The company also manufactures the "Duplex" Tubular Plate Press, which represents the latest development in rotaries. It prints, folds, and delivers newspapers of any number of pages from two up to their maximum (by two's) from a single set of stereo plates, at the rate of 25,000 per hour. The newest appliance put on the market is the L. and M. "Renaissance" press for machine photogravure at high speed.

George Mann and Co., Ltd., Larchfield Works, Hunslet, Leeds, and **Henry-street, Gray's-inn-road, London.**—The great success attending the manufacture of the Mann type of offset machine still continues. As will be seen from their various advertisements they are now being built in sizes from demy-quarto to eight-crown, and in the Two-Colour Rotary Offset and Perfecting Machines they have been built from quad-crown to eight-crown. Firms that are interested in the very latest in lithography should not hesitate to apply to Messrs. Mann and Co. for some of their offset publications; a catalogue, calendar, show-bills, and all types of offset work have been produced throughout by this new method, and are at the disposal of printers for the asking. Repeat orders are quite a common occurrence from some of the best houses in the country and also on the Continent. The Patent Rotary Tin Printing Machine also continues to give satisfaction, and meets with a ready sale. The new offices opened by this firm recently include New York, Berlin, and Birmingham, and these centres are adding numerous orders to the already complete list which is obtained from British users. Messrs. Dryden and Foord's business and Messrs. Geo. Newsum and Co., Ltd.'s, have both in recent years been acquired by the firm, and the usual business dealt with by these firms is receiving the attention of the expert staff of Geo. Mann and Co., Ltd.

Miehle Printing Press and Manufacturing Co., Ltd., 85, Fleet-street, London, E.C., supply the celebrated American-make of printing presses that are known by the title of "Miehle." The machines are built in various styles, as Perfectors, in two sizes; Two-Colour Presses, in three sizes; and Single Two-revolution Presses, the latter in eleven sizes, from eight-medium to double-crown. These presses are very fast running, the perfectors being speeded up to 1,900 per hour, and the two-colour and two-revolution presses to 1,700 and 2,700 per hour respectively. The firm claim to be the largest manufacturers of two-revolution presses in the world. Arrangements can be made to see the macnines at work.

George Newsum and Co., Ltd., 211-213, Hunslet-road, Leeds.—This old-established firm are makers of lithographic machines, bronzing machines, hand and steam litho presses, sheet varnishing and gumming machines. Being incorporated with Messrs. Geo. Mann and Co., Ltd., they have the full advantage of the use of all the very latest machine tools and appliances which have recently been installed.

Digitized by Google

The Northern Press and Engineering Co., Ltd., South Shields; and 18 and 19, Whitefriars-street, London, E.C.—This is an entirely British firm having extensive, well organised works, equipped with the most modern labour-saving machinery, and are in a position second to none for the manufacture of printing machinery expeditiously and economically. They are makers of all kinds of high-class fast rotary machines working from one up to eight rolls of paper, either single or double width; special magazine and novelette machines; fine art all-size presses which will print sheets 60 by 40 inches down to 30 by 20 inches, and deliver them open or folded in any manner desired; the "Norpress" Flat-Bed Web Machine for printing from type forms, producing up to twelve pages at one operation, delivering the product folded and counted. Their "Multiplate" Automatic Casting, Boring, and Trimming Machine will produce finished stereo-plates at a speed of five plates in two minutes. All kinds of improved machines requisite in the stereo foundry are supplied. The finest half-tone illustrations can be produced on their machines, and they make a speciality of designing and constructing machinery to suit customers' requirements, combining with simplicity, efficiency and accessibility. A description of their various machines appeared in our issue of June 30th last.

John Ratcliff and Sons, Junction Foundry, Upper Wortley, Leeds.—Makers of the "Reliable" litho machine. From the very beginning of this house the partners made solidity a feature of their machine, knowing from experience the value of apparatus capable of bearing excessively heavy strains in certain classes of colour work. With solidity they have added high speed to their machines, which are constructed with an automatic damping apparatus and flyers. The above machine has been used for embossing in oleographic work, which is ample testimony to its strength. The latest addition to the firm's lithographic presses is the "Reliable" Offset Flat-Bed Litho Machine, which has been put on the market to enable work of the highest class to be produced, either in black or colours, by the new rubber offset process, the price being low enough to place it within the reach of almost every lithographer. This machine may be used for working from either stones or metal plates. The varnishing machines, and litho and copper-plate presses turned out by the firm are well known in the trade, as are also their bronzers. They also construct collotype machines. In addition they make a strong colour grinding mill, a colour mixer, and also a litho stone grinder built upon novel principles.

A. Sauvee and Co., Ltd., 60, Park-street, Southwark, London, E.C.—Newspaper, rotary, perfecting and other printing machines are handled by this firm, whose name is well known in the trade. There is practically no requirement of the printer in the way of machinery that they cannot supply. Among their latest introductions is the "Elby" High-Speed Perfecting machine, an all-size reel or hand-feed with a guaranteed capacity of 2,000 per hour, thus giving double the production of a single cylinder machine.

J. G. Schelter and Giesecke, Leipzig, are the makers of the "Phœnix" platen press, a powerful machine that is made in several sizes, and the heavier grades of which are specially constructed for heavy process block printing, letterpress embossing, and gold blocking; the platen can be heated by either gas, steam, or electricity. These machines are also adapted for creasing and scoring cardboard boxes, for which purpose special cutters, creasers and scorers can be supplied. The British agents are Messrs. Wesselhoeft and Zimmermann, of London, Nottingham, and Glasgow. Messrs. Middows Brothers, 73, Clarence-street, Sydney, are the sole agents for Australasia and New Zealand, and Messrs. John Dickinson and Co., Ltd., for Cape Town, Johannesburg, and Durban. The firm's two-revolution and single-revolution machines are handled in London by Messrs. John Foord and Co., 39, Victoria-street, Westminster, S.W.

Taylor, Garnett, Evans and Co., Ltd., Reddish, near Stockport, are makers of the well-known Mark Smith Vacuum Bronzing Machines, of which a new form has recently been introduced to meet the requirements of the printer doing small bronzing work, and to enable him to comply with the new Factory Act regulations for this class of work. The new machine is also on the vacuum principle, and possesses many advantages. It is not possible for the operator's hand to get caught in the dusting rollers, no dust whatever can escape from the machine, and rough papers are easily cleaned by the special rollers. The price of this Vacuum Table Bronzing Machine is only £45.

Fredk. Ullmer, Ltd., Standard Works, Cross-street, Farringdon-road, London, E.C.—This firm is one of the oldest and best known makers of machinery for printers and bookbinders in the trade, doing a large home and export business. Among their special productions are the "Standard" cylinder and platen printing machines, cutting machines, perforators, paging machines, etc. They are also makers of most of the best quality general material used in printing and bookbinding offices. They publish periodically their "Standard Circular," which contains particulars of a large number of their specialities, and a copy of this "Circular" will be posted free to printers and bookbinders in any part of the world on receipt of business card. Their manufacturing departments are well equipped with modern plant for turning out reliable appliances quickly and well.

Waite and Saville, Ltd., Falcon Works, Otley, Yorks, make a number of patented machines for printers and stationers. Their "Falcon" Safety Platen, with gripper feed and self-delivery, has from two to three times the output of an ordinary platen, and is in use all over the world. These presses are built in five sizes:—10 inches by 7 inches, foolscap folio, crown folio, demy folio and royal folio, and in two types—the Standard Model with plate inking, and the Art Model with cylindrical inking and numerous refinements which make it suitable for turning out the finest three-colour work at a high rate of speed. The 10 inches by 7 inches (Express Falcon) can be supplied with a detachable automatic envelope feeder, which enables it to run at 4,500 per hour. A further development is the Full Automatic Falcon, in which is embodied an efficient sheet feeder patented by the firm. Another very successful machine is the Waite Die and Plate Printing Press, of which over 600 have been sold, and for which the demand steadily increases. The makers claim that it has not only a much larger output than other machines, but is also far more economical in wiping paper. Messrs. Waite and Saville are also specialists in tag-making machinery, chief of which is the Waite Tag-making and Two-Colour Reel Printing Machines, which will automatically turn out 12,000 completed washer tags, printed in one or two colours, per hour. Other tag-making machines are the Record, the Despatch, and the Velox Washering Machine. The latter automatically glues, makes, and affixes a pair of washers on tags, envelopes, carrier bags, etc. The Waite Reel Platen, size 18 inches by 12 inches, has an output of 6,000 to 7,000, one colour, or 3,000 to 3,500 two-colour sheets per hour. Two of these machines recently supplied to a large firm are producing 60,000 two-colour soap labels per hour. The Peerless Combined Punching and Eyeletting Machine is another popular machine made by Waite and Saville. The last machine placed on the market by this enterprising firm is the "Waite" Rotary Offset Press, and its success has been most marked. Already over 40 are in use, and numerous repeat orders placed, while in one office in the Midlands seven of these presses are running side by side. The machine is of compact design, and embodies numerous patented features, which are to be found in no other offset press. The works are equipped with the most up-to-date labour-saving machine tools obtainable, and all machines are built on the interchangeable system.

PAPER MANUFACTURERS, WHOLESALE STATIONERS, ETC.

Becker and Co., Ltd., 64, Cannon-street, London, E.C., supply Austrian, Canadian, Finnish, and Swedish leatherboards, wood pulp boards, and grey boards of a high quality and at moderate prices. The firm claims to be the largest importers of wood pulp in the United Kingdom and also quotes specially low prices for large quantities and contracts. Stocks are kept at London, Liverpool, Manchester, Hull, Preston, and other places, ready for immediate delivery.

Brindle and Son, Ltd., Samlesbury Paper Mills, Hoghton, near Preston, Lancs, are makers of Kraft papers, cotton samplings, cutlery ropes, pure rope browns and casings, parchment browns, bag browns, and other papers, which are supplied either on reels or in reams, and packed for export. Samples and prices will be supplied by the firm on application. An illustrated article on the Samlesbury Mills appeared in our issue of September 26th, 1912.

Robert K. Burt, 19-21, Farringdon-street, London, E.C., is a papermakers' agent who stocks and samples "news" in reams and reels, printings, super-calendered, litho, writings, art, imitation art, blottings, browns, tissues, and other papers of excellent quality.

G. and T. Carlyle, Ltd., 116, Duke-street, Liverpool.—This firm holds an honoured pioneer position as manufacturers of manifold, tracing, carbonic, and other papers for duplicating purposes, both bound in books and in single sheets. The manifold papers are of remarkably good quality and not to be excelled by any other English makes. "T.G.M." and "S.G.M." are well known to all business men who use manifolding apparatus as the distinguishing trade marks of two of the best makes of manifold papers now on the market. Other special lines are the tracing papers, supplied in both thick and thin qualities. In carbonic papers again, this house does a very large trade, and fresh lines are constantly being introduced. One of the last is the blue-black paper, which gives a result almost exactly like that produced by ordinary ink; other stock tints are mauve, black, blue, etc. The "Oiled Royals," too (the oil sheets used in the copying press), made by Messrs. Carlyle are as good as any we have seen, and we have tested them in the only practical way, *i.e.*, by using them ourselves. Some excellent hand-made qualities are now being supplied. Messrs. Carlyle also issue a most useful series of manifold books for every conceivable commercial purpose. We are informed, and can well believe, that all these books are popular and going lines, and sell well in Australia, New Zealand, Canada, etc. The same may be said of the papers, particularly the carbons and manifolds, they being specially made to keep good and unaffected in hot climates. The firm allows exceptionally good terms.

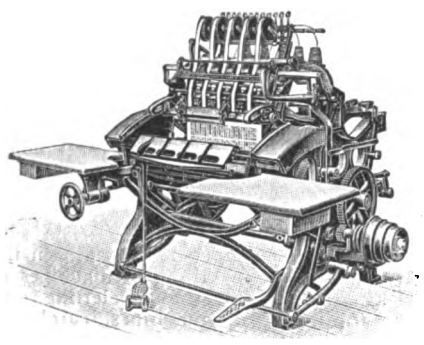
Digitized by Google

The Culter Mills Paper Co., Ltd., Aberdeen.—This mill is known not only for the dependable qualities of its fine printings, envelope papers, writing papers, arts, and chromos, but for its capacity in turning out other high-grade specialities for papeteries, and original makes in lined, fancy, and ribbed papers. Their imitation hand-made printings, with rough deckle edges also have a large sale. The regularity of their makes of printings highly commends them for book work.

John Dickinson and Co., Ltd., 68, Old Bailey, London. Mills: Croxley, Apsley, Nash, and Home Park, Hertfordshire.—One of the most eminent firms of papermakers and wholesale and export stationers in the United Kingdom. The principal of the many specialties of this very old-established firm are superfine, fine, and every description of printing paper; map and chart papers (in which they have a new and cheaper quality) of exceptional strength; hand-made printings, glazed and rough, for *editions de luxe*, etc.; tinted writings, and coloured papers for pamphlet covers; brown and packing papers of every description; tub and engine sized writings; blotting and cartridges; envelopes; chromo enamel papers, surface and enamel papers, boxed stationery, cards and cardboards, white and tinted. Messrs. John Dickinson and Co.'s "Art Paper" meets the most exacting requirements of the art printer, and is stocked in several grades. An important point with this firm is their dependability in the preservation or matching of shades of colour, so great a factor where goodwork is done. A speciality made is an all-rag durable, three-colour illustration paper, which has been adopted by the leading colour printers of the kingdom. This paper is aptly entitled "Durochrome," quires of which are available for testing upon requisition. The paper upon which this issue is printed was manufactured by this firm.

Jacobsen, Welch and Co., Ltd., Newton Mill, Hyde, claim to be the largest makers of artistically packed stationery in the United Kingdom. They have an enormous selection of designs in boxed stationery in all grades, and make a feature of writing pads, envelopes, and note papers in all the popular qualities. The firm's London showroom is at Newton House, Paternoster-square, E.C.



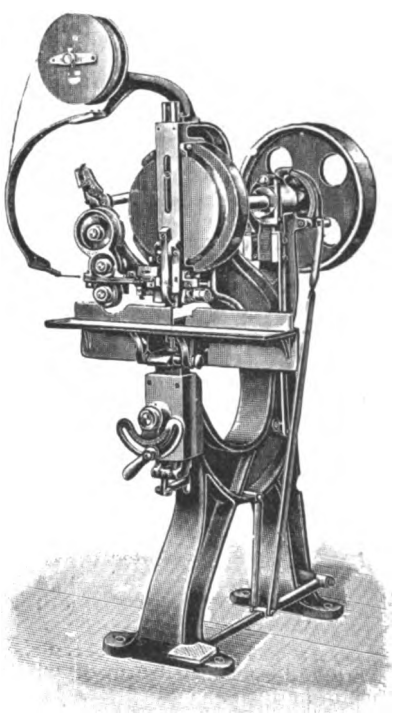
Samuel Jones and Co., 56, Carter-lane, London, E.C., are manufacturers of reliable gummed papers, etc., a feature being that they can make them quite non-curling, a very important quality where printing has to be done, as every printer who has handled gummed paper knows. A wide range of colours is offered of which prices and particulars may be had on application. The firm's factory is at Camberwell.

J. and J. Makin, Ltd., 20, Mount-street, Manchester.—A large and varied stock is kept by this firm comprising all classes of paper that are used by printers, stationers, pattern card-makers, box-makers, etc. At the Manchester premises a varied stock is kept of all classes of M.F. printing paper, supercalendered printing paper, glazed and unglazed coloured printing, white art papers,

AUG. BREHMER,

12, CITY ROAD, LONDON, E.C.

ESTABLISHED 1876. PARIS EXHIBITION, 1900, GRAND PRIX and GOLD MEDAL. BRUSSELS EXHIBITION, 1910, THREE GRAND PRIX.



WIRE STITCHING MACHINES.

Over **22,500** sold in United Kingdom; **60,000** all over the world.

Of many sizes, ranging in price from £2 12s. 6d. to £55, stitching thicknesses up to 1⅝ inches.

The well-known **WIRE STITCHING MACHINE No. 4a,**

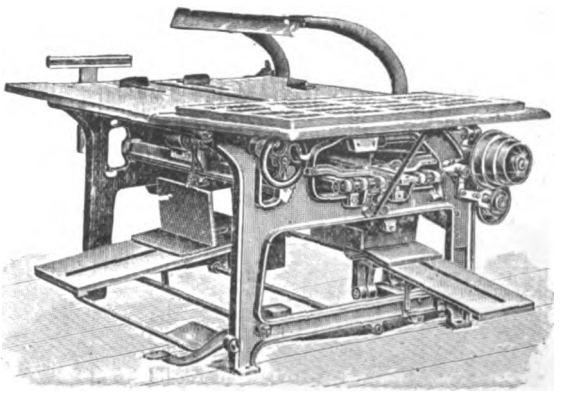
Has lately been GREATLY IMPROVED, and is now the MOST EFFICIENT, HANDY, and, in comparison with the prices of similar machines of other makers, the CHEAPEST Machine on the market.

It will stitch a GREATER THICKNESS than before, viz.: ⅞ **inch instead of** ¾ **inch.**
It is now supplied with a separate head for stitching the THINNEST work, which it will do as perfectly as the smaller machines.
It will stitch pamphlets BOTH WAYS, with the ends of the staples clenched INSIDE the fold, or at the BACK of it.
The starting clutch has been entirely reconstructed and improved, so that the machine works QUITE SILENTLY.
The price of the machine has not been increased, but remains as before, *i.e.*, **£35.** Over **6,000** of this machine sold.

THE THREAD-STITCHING MACHINE, No. 37,

Is now made to produce four sizes of stitches: 2 inches, 3 inches, 4 inches, and 5 inches in length. It is a QUICK Machine (speed up to 2,400 stitches per hour) and not liable to breakdowns or expensive repairs.
Can also be used for making loops at end of books for hanging up, and for stringing showcards, calendars, &c., with thick cord. The **BEST** in the market. Testimonials of leading firms at disposal.

THE GLUEING MACHINE, No. 61,



For glueing or gumming paper or cloth book covers, &c., will save **10 per cent. to 15 per cent.** GLUE, and from **30 per cent. to 50 per cent.** wages as compared with hand labour.

THE LEATHER PARING MACHINE, No. 30,

Has met with unrivalled success! Over **400** Machines sold! Greatest labour-saving machine in existence!
Suitable for **ALL KINDS** of leather.

THREAD BOOK SEWING MACHINES, IN 5 SIZES.

For ACCOUNT BOOKS, LETTER COPYING BOOKS, GUARD BOOKS, LETTERPRESS WORK, &c.
Over **1,500** of the various sizes sold.

WIRE BOOK SEWING MACHINES,

For GUARD BOOKS, SCRAP BOOKS, ALBUMS, &c.

FOLDING MACHINES IN 70 DIFFERENT PATTERNS.

For BOOKWORK, STATIONERY WORK, and NEWSPAPERS, OVER **1,800 MACHINES SOLD.**

DISC RULING MACHINES.

BOX-MAKING MACHINERY,

For ordinary and Folding Boxes, including Corner Staying Machines.

THE ENDSHEET PASTING MACHINE, No, 62.

This Machine will automatically paste endsheets, plates or maps, &c., on the outside of book sections, and is finding great favour with the trade. It can also be had for turning end sheet over section and pasting it on.

Digitized by Google

tinted and duplex art papers, tin foils, plain and embossed, goldfoils flint papers, cover papers, cartridge papers, in reels and sheets, tub-sized and engine-sized writing papers, ledger papers, copying papers, manifolds, tissues, enamel and surface papers, white and coloured pasteboards, bright and dull enamel boards, coloured enamel boards, coated boards for post cards, caps, skips, and other packing papers, strawboards, leatherboards, wood pulp boards, silk boards, folding boards, cloth-lined boards, all kinds of boards and papers for the use of box-makers, etc., etc. The firm claims to carry the largest stock in Manchester. The works are at Wallhead Mills, Rochdale, and Disley Mills, Disley. Export orders are carefully and promptly attended to.

Millington and Sons, Ltd., London.—One of the most respected names in the wholesale and manufacturing stationery trade of today, doing business in every quarter of the globe, and possessing first-rate connections, home and Colonial.

Parsons and Whittemore, Inc., 174, Fulton-street, New York, U.S.A., are exporters of papers and allied lines, including the Keith papers and papeteries, photo-mount, box boards, bristols, etc. The firm also act as agents for the American "Leader" envelope machine, the "Rosback" rotary perforating and punching machines, the "Eclipse" newspaper and job folding machines, and all varieties of steel filing cabinets, office furniture, addressing machines, etc.

A. M. Peebles and Son, Ltd., Queen Victoria-street, and 3, West Harding-street, London, E.C. Mills: Rishton and Whiteash; also Art and Chromo Works, Rishton, Lancashire. — This well-known and old-established paper-making firm has long held a leading position for the production of papers for high-class periodicals, and at present probably holds the largest contracts for English illustrated journals and magazines. A feature of their production is the special photogravure papers for intaglio printing, which, in view of the great impetus to this class of illustration by the introduction of new machinery, should have a good demand. The large and varied output of three mills, comprises super-calendered and machine-finished printings, imitation arts, and litho and varnishing papers, white and tinted writings, cartridge and featherweight book papers, pulp boards, typewriting and duplicating papers, as well as all grades of art and chromo papers and boards and tinfoil. Large stocks are carried, and they are prepared to make special orders on short notice. They will appreciate enquiries from Colonial and Continental printers, and will put firms on their very best terms. Messrs. Peebles are represented in New Zealand, France, Holland, South American, and Japan. The names and addresses of their agents will be found in their advertisement in this issue.

R. Robinson and Co., Ltd., Newcastle.—This is a very old-established firm of wholesale stationers and paper dealers, letterpress and litho printers, paper bag makers, etc. Practically every description of work connected with printing, stationery and bookbinding is undertaken by them. They also carry on cardboard box-making in all its branches, and have a large photographic studio and process engraving department.

Strong, Hanbury and Co., Ltd., 196-7, Upper Thames-street, E.C., are considerable exporters of news, printings, coloured papers, browns, cases, tissues, writings, and blottings. They control immense stocks, and are in complete touch with all home and continental mills. To facilitate quick trading they stock very largely at their London warehouse, averaging 2,000 tons of various makes. This firm are contractors to H.M. Stationery Office, the London County Council, various railways, etc., etc. Their extensive "Colindia" series of papers and cardboards should be specially noted, as comprising an unsurpassed range of varieties of quality and price. Samples are sent free on application.

PRINTERS' and STATIONERS' APPLIANCES, &c.

The Aerograph Co., Ltd., 43, Holborn-viaduct, London, E.C., manufacture and supply the "Aerograph" spraying apparatus, an appliance that has made for itself a reputation in the trade for the excellent and artistic effects that may be produced by its use. For colouring embossed work, stencilling, shading, working-up drawings and photographs it is an immense labour saver. Twenty different types and sizes are made to meet varying requirements. A new type of apparatus, by means of which very rapid stencil work may be done, has recently been introduced.

Algraphy, Ltd., Peckham, London, S.E. — This house supplies all kinds of lithographers' requirements, including aluminium and zinc plates, offset blankets and graining materials. The correct thickness of blankets and plates are held in stock for makes of rotary and flat-bed offsets, direct and tin-printing machines, and flat-bed litho machines.

The Original Bates Manufacturing Co., U.S.A. European Agent: Samuel Insull, Son., 34, Queen-street, Cheapside, London, E.C. — The Bates Manufacturing Co. are the original makers of special automatic hand-numbering line-dating and other machines. The special feature of their hand-numbering, machine is that every figure disc changes automatically in its consecutive order, from 1 to the full numerical capacity of the machine —a feature of the greatest importance. It also duplicates and repeats. This is easily effected by the mere moving of the small handle of the pointer in front of the dial plate. It is almost perfectly noiseless in its operation. There are four styles of figures, and the mechanism is so arranged that machines can be supplied with 3, 4, 5, 6, 7, and 8 wheels, and to operate "Consecutive," "Duplicate," or "Repeat," "Consecutive," "Triplicate," or "Repeat," "Consecutive," "Quadruplicate" or "Repeat," "Consecutive," "Quintuplicate" or "Repeat," "Consecutive," "Sextuplicate" or "Repeat." These hand-numbering machines are also made with letter wheels to precede or follow the figure wheels. The original "Bates" line-dating machine is similar in appearance to the numbering machine, and is fitted to a gauge to enable the user to place the date exactly upon the line. These machines are beautifully made and wonderfully accurate. The figures and all wearing parts are made of steel, and are interchangeable to the smallest screw. The "Wizard" is a high-grade automatic hand-numbering machine, which is constructed in a substantial manner with a view to supplying the demand for a lower priced hand-numbering machine where the work is not of such volume or nature as to require a stronger-built mechanism. The dial setting movement in front of the machine permits instant adjustment of three actions, viz., consecutive, duplicate and repeat. Several new machines for dating and impressing useful words on accounts, bills, and letters; also yardage measuring machines for textiles, etc., are handled.

David Carlaw and Son, 11, Finnieston-street, Glasgow, are makers of the "Leader" improved adjustable envelope folding and gumming machines, which may be arranged for three or more sizes and shapes of envelopes on the one machine. A die stamping attachment can also be provided. These machines will work thick or thin paper, and have a speed of 100 per minute, gummed, counted, and ready for banding; they can be operated by one girl. The firm have a number of other machines and appliances, including check book printing and numbering machines, of which they will send particulars on application.

W. J. Connell and Co., Ltd., 5, Maclean's-buildings, New-street-square, London, E.C.— Printers' machinery and materials are dealt in by this firm, who are in a position to supply anything almost wanted by the letterpress or lithographic printer, bookbinder, or manufacturing stationer in the way of machines, gas engines, folders, perforators, stitchers, etc. A full stock of brass rule, furniture, reglet, and other materials is kept and orders can be supplied promptly. The firm make a special feature of machinery repairs and removals, and a staff of engineers and fitters is always available. A fully illustrated catalogue is issued giving details of machinery and materials.

J. S. Cook and Son, 17-19, Finsbury-street, London, E.C., are manufacturers of and dealers in printing materials of all kinds, and are wholesale and retail printers' furnishers.

Day and Collins, King-street, Leicester.—This firm, with a well-known reputation for their specialities, have now removed from Fann-street, London, to Leicester. They make and supply all kinds of wood letter, including rotary type, borders for posters, show-cards, etc., and wood blocks, figures for almanacs and similar utilities for printers' use; all cut on hard-faced wood and machine engraved.

Robt. D. Delittle, Promenade-road, York, is a maker of a superior class of wood letter for printers that has met with much approval from the trade. He now keeps a stock of about 2,000 founts, and is in a position to execute home and Colonial orders promptly.

Oscar Friedheim, 7, Water-lane, Ludgate-hill, London, E.C., manufactures a wide range of machines for the bookbinder, printer, box-maker, and other kindred trades, among which may be quoted rotary cutting and scoring machinery, gold blocking presses, die-stamping machines, folding machines, and machines for envelope making in a great variety of styles. The firm is noted for the high quality of the machinery and appliances that are handled.

K. Gebler, Leipzig-Plagwitz, 35. — The speciality of this firm, since 1886, has been the construction of wire stitching machines of every kind, punching and eyeletting machines, folding box machines, cardboard and slitting machines. They also supply stitching wire, staples, metal strips and eyelets, and give the best discounts to trade houses.

A. Gutberlet and Co., Leipzig-Molkau, are manufacturers of folding machines to suit the requirements of printers, manufacturing stationers and bookbinders. They have achieved a high reputation for quality and usefulness, and are at work in all the civilised countries of the world to the number of over 1,000 machines.

John Haddon and Co., Salisbury-square, Fleet-street, E.C.—This firm is known throughout the trade for the many specialities offered to printers in machinery and general supplies of all kinds. They offer an excellent range of platen machines in no less than 32 different styles and sizes, including the "Caxton," the "Art Caxton," the Haddon "Safety Platen," the Improved "Gordon," the "Victoria" and the "Swift." The "Kidder" platen machines that print from the reel, and in one or more colours, are also stocked in twelve styles. They also handle the "Babcock Standard" cylinder press, and have a good range of blocking presses, and a clever Tape Printing Machine that prints tapes from 10 to 24 inches long, with an output of 3,000 tapes per hour. Printers' Woodwork is made a feature, and cases, frames, dustproof cabinets, racks, furniture holders of the most up-to-date character are manufactured at the firm's works at Market Harboro,' where also there is an exten-

sive type foundry. Illustrated catalogues giving exhaustive details of the firm's manufactures are supplied to printers on application.

Hewitt Bros., Field-street, King's Cross, London, W.C.—This is a firm of stereotypers' and printers' engineers, who specialize in printers' chases. They are also brass rule makers. The machines they handle include stereotyper's single saw bench and a new type of toggle press, a flat radial arm routing machine, and a combination finishing bench, circular saw, edge planer, beveller, flat router, nrill and jig saw, to which a drill post can be added if desired.

O. Hoppe and Co. Nachf., Leipzig 16, Germany.—This firm handles a number of useful machines and appliances for various uses in the printing and allied trades. These include machines for the making of different classes of labels, for sewing, perforating, eyeletting, punching, a stapling maching for special large outputs, and a machine for the manufacture of loose-leaf books, calendar boards, card-index system requisites, and sample cards.

Hunters Limited, 16-18, St. Bride-street, London, E.C.—This firm has extensive show-rooms which are always equipped with a very wide range of machinery for the production of rail and tram tickets of all kinds, also machines for slitting and re-winding paper with the greatest precision. The firm represents Messrs. Klimsch and Co., of Frankfurt, whose products are well known all over the world; Messrs. Kœnig and Bauer, of Wurzburg, manufacturers of fine art and newspaper rotary presses; Hogenforst, of Leipzig, a manufacturer of specialities for photo-engravers, electrotypers, and stereotypers. Probably their greatest feature at the present time is the supply of everything for photo-engraving. One of the most notable pieces of apparatus they construct is the "Arc Gear" camera, the reputation of which is becoming world-wide. They also make a great speciality of stereotyping apparatus and materials, especially matrix papers, paste powder, and facing paste, and are the British agents for the Miller Incline Truck Company.

Samuel Insull, Sen., 34, Queen-street, Cheapside, London, E.C.—Here can be obtained hand-perforating stamps of every description for banks, trust companies, corporations, and railway companies. The "Chicago Check" Perforator is a compact, light, durable, rapid and effective machine, handsomely finished, and with the most perfect automatic paper-feeding mechanism. It is operated with one hand, and perforates any part of the cheque. Over 30,000 of these machines are in use in the United States, Canada, and in all parts of Europe; it is recognised as the standard device of its kind, and is very cheap. Mr. Insull can also supply perforating presses for cancelling cheques in large quantities (40 or 50 at one stroke), other perforating stamps for dating and perforating useful words on bills, invoices, letters, etc. Letters only on postage stamps. Yardage measuring machines for textiles, etc., are also supplied.

John Jardine, Deering-street, Nottingham.—This is an old-established engineering firm, well known in the lace trade. They have put upon the market several platen printing machines of high quality, and possessed of many improvements, especially in the inking apparatus, the aim being to produce a first-class article at a moderate price for cash. Paper-cutting machines are also made by the

firm, as well as shafting, pulleys, belting, hangers, etc.

Emil Kahle, Machine Factory, Leipzig-Paunsdorf, Germany.—At these works there is manufactured a number of machines for the allied trades, including platen presses perfecting machines, and stereotyping plant of every description. As illustrating the popularity of the machines we may note that the annual yearly output of platens is over 700, perforating machines 800, and stereotyping appliances 1,800.

Kampe and Co., 2, Sandland-street, Red Lion-street, High Holborn, London, W.C., have removed from their old premises at 76, High Holborn (owing to rebuilding operations), and have an extensive show of machinery on view in their new place. They are specialists in and supply all kinds of machinery and presses for printers, bookbinders, box-makers, gold blockers, papermakers, manufacturing stationers, etc., and are sole agents for the well-known firm of Karl Krause, Leipzig, and other first-class Continental houses. The leading lines include gold blocking, embossing and inking presses, index cutting machine for power, combined rotary cutting and scoring machines, calenders, guillotines, dead square, three and four-sided cutting machines, millboard and cardboard cutters, backing and back-making machines, copperplate presses, complete plant for the production of every style of box, wire and thread sewing and stitching machines, etc.

Joseph Kaye and Sons, Ltd., Lock Works, Leeds. London Offices: 93, High Holborn, W.C.—This well-known firm holds a high position in the lock and door-furnishing trade. Patent locks, bolts, latches and handles for every kind of door, desk, or drawer, is included in their catalogue, while railway door fittings are made a speciality. The firm's "Patent Steel Seamless Oil-can," which has also a seamless spout and a new patent thumb button, is in great favour wherever machinery is used. These oil cans have been supplied to the Navy, the War Department, Home Office, Indian State Railways, and other Government Departments. The firm recently secured a further order for 3,918 oil-cans and 6,963 seamless spouts for H.M. Dreadnoughts.

Kendall and Sons, Norfolk Iron Works, Shoreditch, London, are well-known makers of all kinds of cutting knives for printers and manufacturing stationers, including guillotine cutters, fancy cutters, envelope cutters, deckle knives, etc. They now manufacture the "Gough" Automatic Colour Stamping Presses, the No. 2 size of which takes a die 5 inches by 3 inches. The firm also makes envelope folding machines, punching and cutting machines, and other appliances. They have a City showroom at 17, Whitefriars-street, E.C.

Karl Krause, Leipzig, is a name that is known to users of printing, bookbinding, and kindred machinery all over the world. 6,000 machines are turned out annually. Paper cutters are a speciality, and some exceptionally large and strong embossing, and embossing and gilding machines are manufactured. The 110,000th machine made at these works was lately completed. The firm employs over 1,250 workmen and 200 clerks. London Agents: Kampe and Co., 2, Sandland-street, Red Lion-street, High Holborn, W.C.

August Kraushaar, Hanau a/M., Germany, supplies a cylinder dust bellows for use by printers, typefounders, electrical engineers, and others. These bellows have no metal mountings, the nozzle as well as the body being of wood. They are very light, and are most useful for blowing type cases, etc. In London they may be obtained from Fredk. Ullmer, Ltd., Cross-street, Farringdon-road, E.C., and other houses.

C. L. Lasch and Co., Machine Works, Leipzig 86.—This firm, founded in 1882, specialise in wire stitchers and eyeletting machines. Catalogues may be obtained from Lotz, Abbott and Co., Ltd., 21, Ropemaker-street, Finsbury-pavement, London, E.C.

P. Lawrence, 103, Farringdon-road, London, E.C., for many years connected with the P. Lawrence Printing Machinery Co., Ltd., of 57, Shoe-lane, E.C., is now manufacturing cardboard cutting, creasing, and scoring rules, and other specialities for boxmakers and printers.

William J. Light, 127, Fenchurch-street, London, E.C., makes a special feature of the supply of the "Ideal" Dry Flong for stereotypers, the "Claus" Felt Substitute, and the "Tindeck" Press Blankets, materials that ensure the best results by their use. Mr. Light will be pleased to supply full particulars to those interested, and doubtless to their great advantage in the matters of time and money saving.

Linotype and Machinery Limited, 189, Fleet-street, London, E.C.—Makers of the Linotype typesetting and casting machine, that is in use in all the largest newspaper and jobbing offices in this country, our Colonies and America, and in a very large number of Continental offices. It is not alone in the large offices that the Linotype is used—all over the kingdom it is found, and is as serviceable to the printer who can only employ one machine as to the firm that can instal a whole battery, whether for news, book, or jobbing. Many improvements have recently been made, and quite a choice of faces may be set on the same machine. The New No. 4 Model gives a range of 15 alphabets that can be set without the operator leaving his seat. The company supplies a perfect quality of metal for use with their machines, that does not clog, and gives clear, sharp casts from the matrices. The company's extensive works at Broadheath are fitted up in a magnificent manner with the finest machine tools.

The London Paste Co., Arlington-street Works, New North-road, London, N.—This firm is noted for a capital make of prepared paste for printers and stationers, that keeps well and has good adherent qualities.

Lovell's Bag and Packet Machinery, Ltd., 59/60, Gracechurch-street, London, E.C.—As the title of the firm implies, bag-making machinery is the special manufacture carried on, and a new Bag Machine has just been introduced that makes square-bottom bags, lined and unlined, for tea, flour, sugar, salt, cash-bags, etc.; and folds in either of these methods. On this machine several bags are in process of making at the same time, with the result that easy movements and plenty of pressure are combined with high output.

Marryat and Place, 28, Hatton-garden, London, E.C.—This firm manufacture the celebrated "Gough" Die Stamping Presses, as used by manufacturing stationers, envelope makers and others. They are successors to Messrs. Joseph Richmond and Co., Ltd., whose reputation for these machines was world-wide. The presses are made in a variety of styles and sizes, and are most handy and useful appliances.

Drahtheftmaschinen - Fabrik Wilhelm Mallien, Leipzig-Li. 74, Germany, is a firm which specialises in cardboard box, book or pamphlet sewing machines, and makes these machines in all sizes and for all purposes. Accurate work is a feature.

Edward L. Megill, 60, Duane-street, New York, U.S.A.—Mr. Megill is well known as the clever inventor of a number of useful appliances for the printer in the form of steel gauge, or laying-on pins and other fitments to aid in the correct register of the finest work. They are made in many styles and are most efficient in their use. His signature and trade mark stand for perfection in this particular line of printers' requisites.

H. Nedden and Co., 11-12, Finsbury-square, London, E.C., handle rotary printing machines of all descriptions and for all classes of work. Also rotary ticket printing machines for tickets in reels or blocks, and slitting and rewinding machines for paper, etc.

William Notting, Bowling Green-lane, Farringdon-road, E.C.—This firm are the most prominent makers of Albion, Columbian and Alexandra presses. They also make the numerous smaller classes of appliances necessary for the printing office—punching and cutting machines, perforators, paging machines, and galley presses. A special feature of the business is the manufacture of machine-made brass rule in all sizes and patterns; the illustrated specimen books indicate the economy and variety of their combinations in rulework for job printing.

The Patent Vacuum Hand-Bronzer Co., 116, Lionel-street, Birmingham.—Gilbert's Patent Vacuum Hand-Bronzer is manufactured by this firm It is an appliance that costs little, and meets the requirements of the new Act. It is claimed for it that there is no waste, and that it is 50 per cent. quicker than hand-bronzing, while there is no escape of dust into the atmosphere.

Preusse and Co., Ltd., Leipzig, Germany, are a large and old-established firm of machine manufacturers, their leading lines being thread-sewing and wire stitching machines for books, pamphlets, blocks and cardboard boxes; paper folding machines for printers and bookbinders, some combined with thread-stitching apparatus; and machines for manufacturing cardboard boxes and folding boxes. Also cardboard shears and bending machines, scoring, fluting, cutting and punching machines.

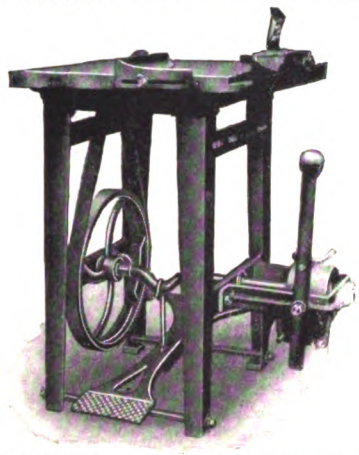
Joseph Renger, Machine Works, Dusseldorf, Germany, offer the trade a gumming, varnishing or pasting machine, also cardboard cutters, slitting and rewinding machines, cross cutters, bookbinding machines, etc.

Mr. C. Ritchie, 107, Clifton-street, Finsbury, London, E.C.—Many and varied are the machines handled by Mr. Ritchie, among them being included rotary printing machines for special work, reel-fed and sheet-fed rotaries, slitting and re-winding machines of every description, automatic and non-automatic tube-winding machinery for making tubes up to sixty inches in length, gumming and glueing machines, and other appliances.

L. Schmautz, 76, Rue de Seine, Paris, is noted for his rollers and roller skins for either hand or power lithographic presses. Mr. Schmautz is well known for his manufactures, and makes special rollers for zincography, phototype, collotype, copperplate, and photogravure presses. An English price list will be sent free on application.

John Shaw and Sons, Honley, Huddersfield.—This well-known firm keeps on expanding and increasing its yearly output of Ruling Machines, in which they specialise. Their world-renowned "Striker" machines have a greater sale than ever, but this is to be expected when we know that Messrs. Shaw and Sons are continually introducing improvements that are calculated to save both time and labour. The firm has now supplied over 3,000 ruling machines, which have gone all over the world, and especially to Canada, where they seem to have got the better of the American makers. Their machines are also shipped to Australia, New Zealand, India, South Africa, and other Colonies, and they are installed in the Government Printing Offices in South Africa, New Zealand, India, and Cyprus. In Great Britain one firm alone has been supplied with considerably over 100 machines. The firm has also an excellent demand for their new "Imperial" Iron Disc Ruling Machine, with automatic feeder attached, made entirely of metal, with the exception of the lay-boys, which delivers the sheets perfectly true and accurate. Some of the largest firms in the kingdom have been supplied with the "Imperial," which the makers claim to be superior to either the French or German built machines. Messrs. Shaw and Sons are complete ruler's outfitters, and their large works at Honley are fully equipped for making any class or style of paper ruler. A descriptive catalogue will be sent on application.

T. W. and C. B. Sheridan Co., 63-69, Mount Pleasant, London, E.C.—This firm handle a large assortment of bookbinding and printing machines. These include perfect binders, wrappering machines, case makers, paper cutters, embossing presses, bundling presses, gathering machines, die cutting presses, casing-in machines, sewing machines, Dexter folding machines and automatic feeders, and in fact all styles of bookbinding, printing and lithographic machines.



Smyth-Horne, Ltd., 19, Cursitor-street, Chancery-lane, London, E.C.—This is a firm that has handsome show-rooms at the above address, where they have on view a considerable number of machines and appliances for the use of the printer, bookbinder, and manufacturing stationer. The firm has been appointed sole European and Colonial agents for the Smyth Manufacturing Co., of Hartford, Connecticut, U.S.A., whose book-sewing, case-making, cloth-cutting, casing-in, glueing, and pasting machines, will be constantly on exhibition for the inspection of those interested. A new book-sewer (No. 8) has just been added to the range of their machines. The Smyth machines are well known, and their merits are thoroughly appreciated, and users and prospective purchasers may be glad to know that Messrs. Smyth-Horne, Ltd., now stock, in London, duplicate parts of all machines, so that, in the event of breakages occurring, repairs may be executed at once, and so obviate the standing idle of machines and their operators. Thread, tape, glue and other materials are also stocked.

Hugh Stevenson and Sons, Ltd., Victoria Mills, Pollard-street, Manchester, are makers of all kinds of cardboard boxes and cardboard box-making machinery. They hold many patents for metal-edging, and also for many box-making machines and appliances. They have just introduced some special machines for covering at one operation both lids and boxes. The firm are agents for the Actien-Gesellschaft für Cartonnagen Industrie, Dresden.

T. C. Thompson and Son, Oxford Works, Great Bridgewater-street, Manchester.—This firm has been engaged in the manufacture of perforating and paging machines for over forty years. Their specialities include the Patent "Excelsior" power perforator with open ends and sliding and lifting sections, unique features which enable work to be done at one operation, which otherwise would require to be done at two. Double-headed paging machines of greatly improved design, simple and easy to work; the figure wheels move apart any required distance and also out of line, the inking is effected by revolving drums and a distributing roller works up the ink. Treadle perforating machines are made in all sizes up to 32 inches, and are fitted with lifting sections, and 10-inch hand lever perforators are made with open ends. Messrs. Thompson and Son being the original inventors of this open end machine. The "Gem" patent platen press is made in two sizes, 11 by 7 and 8 by 5. It works at the fastest speed without noise, jerk, or vibration; this is accomplished by a patent double toggle action which slows the platen down as it approaches the impression and the feed, and gives a good dwell at both ends. The improved impression throw-off is most conveniently placed, and the largest sheets can be fed into these machines, as there is a clear course right through. The firm has also introduced a system of geared inkers for platen machines, and these are attached to the new "Triumph" platen which they have just placed on the market, together with a number of other improvements that enable them to do the best work at a high speed. For cylinder machines there is the "Sheet-Smoother," which ensures perfect register, and the "Self-Contained" geared inking apparatus with reciprocating inking apparatus for wharfedales. Guillotines are also manufactured by the firm in three sizes—24-inch, 26-inch and 32-inch—and are well built, strong, swift and silent running and easy to manipulate. Their "Rapid" Self-Feed Combined Punching and Eyeletting machine has been very ingeniously designed and its functions are performed perfectly. They are also manufacturers of numerous other machines suitable for the printing and allied trades.

Vickery's Patents, Ltd., 10, Devonshire-grove, Old Kent-road, London, S.E., have a number of appliances for the printer, stationer, and papermaker, among them being their "Patent Transporter" by which one man can instantly and easily load a whole pile of paper, without touching by hand, wheel to any desired position, and unload, leaving the Transporter at liberty for other work. One of these Transporters is equal to a large number of trucks, and saves an enormous amount of time and labour, while not injuring in any way the paper handled.

The Wetter Numbering Machine Co., U.S.A. European Agent: Samuel Insull, Sen., 34, Queen-street, Cheapside, London, E.C.—The Wetter Co.'s typographic automatic numbering machines are well known, and are being used in all parts of the world. They have recently produced a new type-high "Wetter," and claim that it is the best and cheapest in the market. It can be easily operated on a cylinder or platen press. The prefix "No." can be removed and another character or blank slide inserted in its place without removing the machine from the press. This is certainly a positive advantage in a type-high machine. The side plates are knurled, the drop cypher is of new construction and cannot get low, each machine is equipped with a hold-down screw, so that any number can be printed a number of times; the plunger is lower than others, the wheels are made of hard steel, the faces of the figures are perfectly flat, and the figures are cut deep, ensuring a clear impression. All parts are interchangeable and made of the best material. The Plungerless "Betterwetter" is a successful plungerless machine that prints figures only. There is a special feature in its mechanism by which the changing of the figures brings into action bearers that automatically hold the printed sheet off the figures while they are changing. The "One-Inch Wide Wetter" machine is designed for numbering tickets (one inch wide and wider) in strips. It has six wheels with condensed gothic figures; five-wheel machines are also manufactured with title figures. The "Midget" Wetter is built like a watch, and is the smallest type-high machine in the world. It was designed to meet the demand for a small machine with figures large enough for ordinary commercial uses. The new features embodied in the "Midget" confirm this title.

A. C. Wells and Co., 105, Midland-road, St. Pancras, London.—Make a most useful appliance in the form of an oil filter, by the use of which machinery and other oils may be cleansed from impurities and used over and over again, thereby effecting a great saving to the consumer.

H. Williams and Co., Red Lion Works, Warner-street, Rosebery-avenue, London, E.C.—A firm of printers' engineers that offers a good line in their "Electroline Enamel Paste" for producing fine art stereos. A catalogue of machinery is issued that may be had on application.

TYPEFOUNDERS, Etc.

The Blackfriars Type Foundry, Ltd., Blackfriars-road, London, S.E.—This firm possesses the monopoly of the most up-to-date and rapid typecasting machines in existence, and by their use are enabled to turn out a high quality of letter at a price considerably under that of any of their competitors. They have an extensive range of faces in both body and display founts, and are prompt and accurate in getting out orders. An illustrated description of their works appeared in our issue of June 20th, 1907.

Cookson and Co., Ltd. (Department M), Newcastle-on-Tyne, manufacture metals for the use of printers and typefounders and users of linotype, monotype, and other casting machines. They guarantee the highest standard of purity, and can supply metals to any specification. The firm's London office is at Cree House, Creechurch-lane, E.C.

Fry's Metal Foundry, 25/30, Holland-street, Blackfriars, London, S.E., manufacturers of all kinds of metals for printers or typefounders' use, including stereotype, linotype, monotype, typograph, electro, etc. Over fifteen grades are kept in stock, and metals can be made to any specification within a few hours, if necessary. The firm has forty-nine years' experience in the manufacture of these metals, and their staff includes two expert metallurgists, whose knowledge and experience is always at the service of customers.

John Haddon and Co., Caxton Type Foundry, Market Harboro', and Salisbury-square, London, E.C.—The extensive typefoundry of this firm is fitted with every modern appliance for the successful production of all classes of type, and the selection offered gives the printer an opportunity to choose faces for any job that he possibly can have, body founts are cast in all the usual sizes, and for the jobbing department excellently designed faces and borders are offered. All the types are cast on point bodies.

Hallett and Son (late **Hallett and Fry**), **202, Rotherhithe-street, London, S.E.,** are a firm of antimony refiners, established as far back as 1806. All printing metals, such as stereo (all grades), linotype, typograph, monotype and type metal, are provided to any specification.

Holland and Co., Albert Works, Marlborough-road, Old Kent-road, London, S.E., manufacture all grades of metals for typefounders, and for the use of linotype, monotype, and other composing and casting machines, as well as for stereotypers and electrotypers. The firm has made a special study of customers' requirements and are prepared to supply metals with whatever qualifications may be desired, or to make them to customers' formulæ. They also take back and treat dross in their refining furnace, and either buy old metals for cash or exchange for new metal. The firm's business extends to South Africa, Chile, Copenhagen, Amsterdam, Brussels, and other places abroad.

T. G. and J. Jubb, Brandling-street, Jack-lane, Hunslet, Leeds.—This firm claims to be the largest manufacturers of metals in this country, and having now completed extensive alterations in their works are enabled to dispatch orders on the same day as receipt. They claim to be supplying at least 75 per cent. of the monotype users in Great Britain with their special metal, and have increased their customers who use lino and stereo metals, and typograph metal. The recent improvements enable them to do all the mixing with the least possible amount of expense, and they are therefore enabled to supply metal of the highest quality at the lowest possible price. Their printers' leads and clumps department is working full time, and although they do not claim to be the largest manufacturers in the world, they claim that their leads are harder, and equal to any printers' leads on the market. All printers' leads, clumps and furniture, are guaranteed to be true to standard, and the finishing of these is all that could be desired. They are regularly sending metal to all parts of the world, and have recently supplied metal for several Canadian newspapers. Any metal users who have not yet had Messrs. Jubb's booklet can have one by sending a post card. This is a very useful book and gives hints on how to keep the metal in good condition. Having supplied metal for over 50 years, the experience they have gained of the various requirements enables them to give a metal which will flow well and give solid slugs for the lino machine. Their stereo metal has printed from 150,000 to 200,000 runs for one particular firm, which is sufficient guarantee that it is of high quality. They claim that after having all these years of experience, and using only the purest materials for their work, they are in the position of being the largest suppliers of metals in the country, and always bear in mind that they are "*Still on their Metal.*"

P. M. Shanks and Sons, Ltd. (The Patent Type Foundry), Red Lion-square, London, W.C.—Newspaper founts cast from extra hard metal, for which the firm allow a good price per pound on all "letter" returned, is the specialty of this house, and Colonial newspaper proprietors have so frequently repeated their outfits that the qualities of the supply cannot be questioned. They have also gone in extensively for jobbing and advertisement type in recent years, and everything is furnished on exact American point bodies. Several new and pleasing faces have lately been added to the firm's specimen book.

Taylor and Watkinson, Belgrave Foundry, New Briggate, Leeds.—Leads cast dead true, a yard long, are produced by this firm from special machines of their own invention for casting and automatically planing leads, turning them out in an accurate style hitherto unattainable, and selling at a price much below the standing quotations of the ordinary typefounders. Their new casting machinery has been arranged in such a manner that within three minutes of starting casting the leads are finished and being packed; orders can thus be turned out to any amount on day of receipt. In addition to the usual four, six, and eight-to-pica leads, they also cast 10, 12, 18, and 24-to-pica leads and clumps in all the usual sizes, and cut and plane at ends to ems without extra charge. No one who has examined this firm's samples would hesitate to place orders with them. The capacity of the works is now over two tons per day. An illustrated article upon them appeared in our issue of July 6th, 1911.

TYPECASTING APPLIANCES.

R. P. Bannerman and Son, Northampton Works, Ringslade-road, Wood-green, London, N.—Messrs. Bannerman have now removed to large and up-to-date works specially built to their requirements at the above address. The change gives full scope to the enterprise of the firm. To their specialities already so well-known in the trade, typecasting machines, moulds and matrices, they have added as their 1912 invention a "Finished Type Mould" for use on their ordinary caster, by which type leaves the machine ready for the case. To printers this is an inestimable boon, as shown by the orders already booked. They also supply all printers' sundries of first quality and at moderate prices. Catalogues and sundries cards may be had on application.

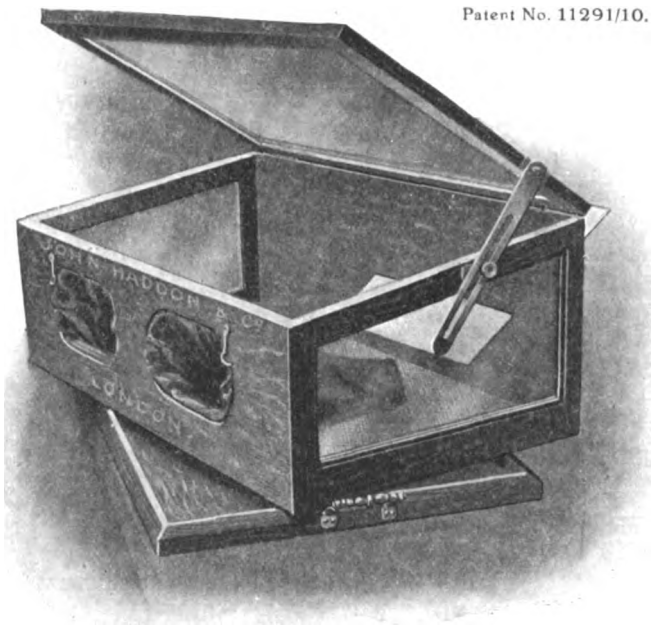
Grant, Legros and Co., Ltd., Cumberland Park, Willesden Junction, N.W., and Avenue-chambers, Southampton-row W.C., are manufacturers, in addition to the latest form of standard typecasting machines, which embody many improvements, of the New Pivotal Typecasting Machines, which produce finished type or type delivered on stick as required. Every appliance for typecasting and for use in connection with the production of a printing surface is made by them, including special moulds of all kinds, not only for the ordinary foundry, but for the many specialities in type and other metals which modern developments of printing and kindred trades demand. They claim to be the only firm of typefounders' engineers to patent and construct their own punch-cutting machinery and unique processes for the production of the formers or models from which the punches are cut, whose original dimensions are not settled haphazard or by simple optical

Digitized by Google

means, but by the employment of the Filar microscope. They produce and strike their matrices in copper, bronze, or rolled nickel, and give facsimiles of any actual fount or any drawn or printed specimen submitted to them. They supply complete plants for the foundry, and also for the production of punches and matrices, applying in their machines the high mechanical skill and accuracy hitherto only applied to the production of matrices in the case of great corporations.

W. Miles and Co., 44, Houndsgate, Nottingham, are manufacturers of typecasting machines of the most approved models, moulds, matrices, and all tools and gauges used in typefounding. They are also engravers and cutters of oriental and other matrices.

Wood, Miles and Co., 40a, King-street, Leicester, are manufacturers of typecasting machines which embody many improvements, moulds, matrices and all appliances for typecasting. They give full instructions to all printers who are desirous of casting their own type. The firm also cast type for the trade, and can supply printers with founts of any quantity at moderate prices. Four of the leading Government printers in London have 30 machines in use. Arrangements can be made whereby printers can visit either the firm's own foundry, or an establishment where they have foundries installed, to view these typecasting machines and outfits in operation. The firm offers to lay down a complete plant for any printer free of cost, concerning which a circular will be sent on application.



PRINTING INKS, &c.

The Ault and Wiborg Co., St. John's-square, London, E.C.—This is a well-known firm of American printing ink makers, with factories at Cincinnati, New York, Chicago, St. Louis, Toronto, and Buenos Ayres, the English warehouse and factory being at the above address. They supply every description of letterpress and litho inks in black and colours, and their manufactures have gained a world-wide reputation for their good qualities, while the prices are right. This issue of the paper is printed with the firm's Surprise Black ink.

Berger and Wirth, Vandy-street, Finsbury, London, E.C., are well known as fine dry colour and printing ink makers. Their specialities are madder lakes, tint white, permanent reds, and fine black cut inks, which latter they are supplying to some of the most prominent firms of art printers. They have also obtained a patent for supplying their well-known "Victoria" and "Bianca" (white) roller compositions, in a way as novel as it is practical. The device admits of the compo being broken up into equal parts with the minimum of time and labour, and is sure to be appreciated by the trade.

Safety Bronzing Cabinet

Patent No. 11291/10.

Cabinet Open, and showing Detachable Tray.

Cabinet in use.

BEST QUALITY WORK
NO DANGER TO OPERATOR
NO WASTE OF BRONZE
INCREASED OUTPUT

THIS Bronzing Apparatus has been introduced to enable Bronze Powders, etc., to be applied by hand without any particles of powder floating about the room, or being inhaled by the operator.

It consists, as shown in the illustration, of a box fitted with hinged transparent top and transparent ends. The side nearest the operator has apertures fitted with flexible sleeves with springs to close round the wrists of the operator, so that, although his hands and arms are free to move inside the box, no powder can escape.

The bottom of box is perforated and allows the surplus powder to fall into a detachable tray underneath. The sheets or cards to be bronzed are fed direct from the platen into a narrow horizontal slit fitted with sloping feed board.

This apparatus is made throughout in our own Works, and the edges of the lid and detachable parts are made dustproof. There is no waste of bronze and no injury to the health of the operator, and nothing to wear out. The bronzing is executed immediately under the eyes of the operator, ensuring finest quality work.

JOHN HADDON & CO.
SALISBURY SQ.
FLEET STREET.
LONDON, E.C.

This Cabinet is designed to cope with work up to and including Foolscap Folio in size

Price £3-3-0

Other sizes to order at proportionate prices.

ACCEPTED BY H.M. FACTORY INSPECTORS. FACTORY AND WORKSHOP ACT, 1901. This appliance complies with the instructions contained in this Act and which reads as follows: "Regulations 2.B. Appliances so constructed as to prevent as far as practicable the escape of dust into the air of any occupied room."

Coates Bros. and Co., Ltd., 8, Salisbury-court, Fleet-street, London, E.C., and at Manchester, are makers of letterpress and litho inks of all classes, varnishes, oils, etc., which are favourably known in the trade. They also supply bronze metal leaf, import litho stones, and do an excellent trade in colours, blacks, etc.

Culross and Co., Ltd., 18a, St. Bride-street, London, E.C., are well-known manufacturers of black and coloured printing inks in all shades, for litho, letterpress, process, three-colour, and poster work. They supply ink specially manufactured to suit all climates.

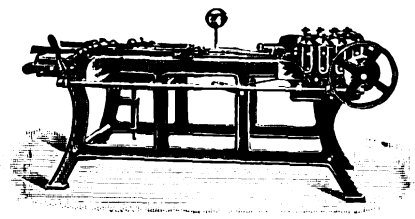
John Kidd and Co., Ltd., Wine Office-court, London, E.C. — This house was originally founded by Benjamin Smith and Co. over a century ago, and has always been to the front in the quality of its inks, which are well known to printers. The firm's works are extensive and well equipped, and every class of ink, in black and colours, is manufactured. They have recently brought out a new specimen book showing over 170 varieties of finest black and coloured letterpress and litho inks; also prices for the "J. K." rollers, which are now so well known and appreciated. Any printer at home or abroad who has not already a copy of this splendid catalogue should write for one. It will be sent post free to any part of the world.

Ch. Lorilleux and Co., 16, Rue Suger, Paris, VIe.—This is one of the oldest and largest firms of printing ink manufacturers in the world, having works at Puteaux and Nanterre, France; Bergamo, Italy; and Barcelona, Spain; with branches and depôts all over the world. The business was founded by Mr. Pierre Lorilleux in 1818, and since then the firm's record has been one of progress. All classes of printing ink are made, including special inks for three colour work, reproducing photographs, and for printing on metal, and the firm is continually seeking for methods that will tend to the improvement of their manufactures for the benefit of printers. London office: 2, Maclean's-buildings, New-street-square, E.C.

Morris and Bolton, Ltd., 17, Took s-court, Furnival-street, London, E.C., and Eclipse Works, Stratford, E., are printing ink and varnish manufacturers, who prepare all kinds of inks and dry colours for letterpress or litho printing. They also supply bronzes and other sundries, and have a long practical experience of the requirements of the trade. Their latest introduction is "Waxovania," a universal solid reducer of all inks.

Riessner, 57, Gold-street, New York, U.S.A.— A firm that is specialising on combination gold printing inks for all kinds of paper that give the true gold effect without the use of objectionable bronzing powder. Specimens and prices are sent on request.

Shackell, Edwards and Co., Ltd. (Established 1786), 5, Red Lion-passage, Fleet-street, London. —This is one of the most up-to-date firms in the trade, and has a connection second to none for printing inks of every description. Orders are executed with great promptitude and their inks are always reliable. As manufacturers of many of their raw materials, and having agencies in most of the Colonies, they are able to quote for export to advantage. A large number of Government Printing Offices are supplied by this house.

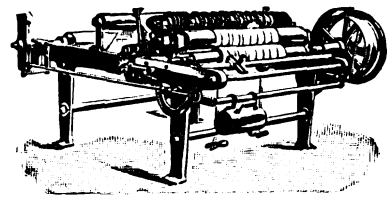


B. Winstone and Sons, Ltd., 100-101, Shoe-lane, London, E.C.—This is one of the best-known names amongst printing ink makers. Winstone's inks for book, magazine, and general jobbing work are recognised for their dependable quality. Their production is under the personal supervision of one of the principals, who brings to it a practical knowledge of the requirements of various machines and grades of paper For extremes of climate their litho and letterpress inks are unsurpassed. They also rank high in the trade for the supply of lithographic requisites generally. Indents for inks or materials of any class are safe in their hands, and their advice is sought by many distant buyers; this is readily accorded and is trustworthy.

LEATHER, FANCY GOODS, STATIONERS' and STORE SUNDRIES.

Baddeley Brothers, Chapel Works, Moor-lane, London, E.C.—Publishers of a series of menu card, ball programme, and wedding card blanks of original and choice designs. Samples are sent free on application.

M. C. RITCHIE'S
SPECIALITIES.



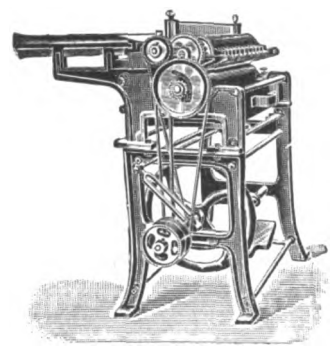
Rotary Folding Box Glueing Machine.

SPEED 200-250 PER MINUTE, or 150,000 IN 10 HOURS.

ANY SIZE BOX, from 1½ in. wide up to 9¼ in., can be SATISFACTORILY dealt with on this machine; these measurements are in the flat and after being folded; recommended for square and tuck-in-end, plain or embossed boxes. Quickly Adjustable, Simple Construction, Automatic Feeding, Glueing, Folding, Pressing, Drying, and Delivering.

Slitting and Re-Winding Machine.

Cutting any Material from Wax-Paper to Tag Stock.

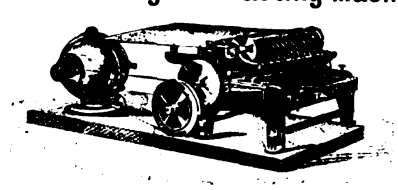


Also Machines for cutting Rubber, Calico, and Insulating Material.

Producing CLEAN, STRAIGHT, and DUSTLESS ROLLS, and RE-WOUND TIGHTLY.

Also Toilet Paper Cutting and Printing Machine.

Adjustable from ⅛ in. wide upwards. Working width from 6 in. wide upwards.

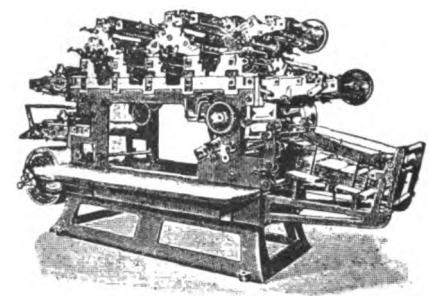


Glueing and Gumming Machine.

These machines can be supplied in various designs, fitted with Automatic Take-Off and Conveyor, for gumming the whole sheet, or for strip work made in sizes from 6 in. up to 40 in.

These Machines are also made for gumming paper in the reel.

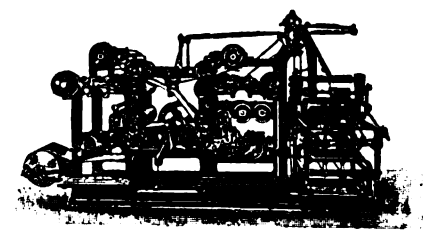
Label Gumming and Pasting Machine.



This ideal machine is recommended for gumming Labels of ANY description, and is an all-round universal indispensable machine.

Saves room, stock and money, improves the quality of labels, and always ready for change of work or jobs.

Made in sizes from 6 in. to 12 in.



Driven by Motor as illustrated.

Hartung, Kuhn & Cie.'s
SPECIALITIES.

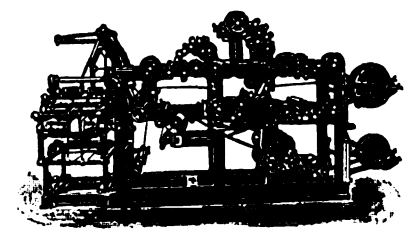
Rotary Ticket Printing Machine

With 6-colour equipment, end delivery. Compact and simple design, smooth running, easily accessible-prints both sides of web, delivers in sheets or strips, fitted with adjustable Numbering Heads and Perforators. Output, Tramway Tickets 250,000 per hour, Sheets of tickets or labels 7,000 to 9,000 per hour.

Duplicate Rotary Counter Check Book Machine.

ONE REEL.

Fitted with funnel folder, tapeless delivery. Constructed to print from 1 to 6 colours, numbers and perforates in any position and delivers folded or flat sheets Output, 1,500 Duplicate Cash Books, numbered and perforated, of 100 leaves each, per hour This machine can only be supplied outside Europe.



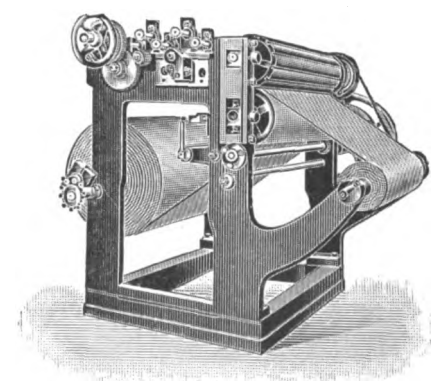


ILLUSTRATION OF

Triplicate Rotary Check Book Machine.

TWO REELS.

Printing from 1 to 6 colours, recommended for Cash Books, Restaurant Books and Drapers' Check Books. Delivering 1,500 triplicate books, printed, numbered and perforated, in any position of 100 leaves each per hour. These outputs can be increased, but it depends entirely upon the cylinder circumference. This machine can only be supplied to users outside Europe.

Rotary Printing Machine

FOR SPECIAL WORK.

Illustration of one-colour machine. Can be constructed to print up to 3 colours, fitted with a rewinder or adjustable cut-off, delivering flat sheets. Speed when re-winding 6,000 to 8,000 yards per hour. Output, when delivering flat sheets, 6,000 to 7,500 per hour.

For full Particulars Apply to Sole Agent:

William Collins, Sons and Co., Ltd., Glasgow and London.—This is one of the largest wholesale and export houses in the stationery and publishing trades; their goods are known all over the world. "Collins' Bibles," gift books, pocket classics, and diaries are to be found everywhere.

Diamond Tag Co., Bermondsey-square, London, S.E.—Manufacturers and printers of tags and labels of every description, and for every purpose, of strong and excellent quality. They are also makers of gum labels, drapers' tickets, waterproof florists' labels, metal-edged labels, merchandise tickets, tack cards, invoice tag envelopes, etc., and are sole makers of the "Lightning" label fastener, an ingenious device that requires no string.

Debecy W. and M. Co., 22, Coleman-street, London, E.C., supply excellent lines in manifold books, including a line of 8vo. 100-leaf books to sell at one shilling; these are in quarter-cloth with marble sides, and are good sellers. Special prices are quoted for quantities.

Dorendorff and Co., 5 and 7, Worship-street, Finsbury, London, E.C., are well known for their fine makes of ivory boards and cut cards, of which over forty qualities and substances are kept in stock. Bevelled edge cards and other printers' fancy cards are kept in great variety. This house also publishes Christmas and New Year cards, wedding cards, menus and ball programmes, masonic cards, In Memoriam cards, etc., etc., all of which are made in the London factory. The well-known private Christmas greeting card publications, under the titles of the "Friendship" and "Britannic" series are manufactured by this firm.

Chas. Eason and Son, Ltd., Middle Abbey-street, Dublin.—A firm famous for its capital series of index and "Where is it?" books, that are used extensively by students and professional men. Their commonplace book (Index Rerum) is one of the best things of its kind ever brought out. The "Professional Note Book" is another excellent line, as is also the "S" series of Universal indexes, in seven sizes. Their "Every Hour" diary is one of the best desk books yet issued. Wholesale agents, Waterston and Son, 8, St. Bride-street, London.

Garwood and Muddiman, Ltd., 9, Queen Victoria-street, London, E.C., manufacture leather and leatherette papers in a variety of styles and colours. The firm also makes a feature of embossing for the trade, and has works at 40, South Lambeth-road, S.W.

Higham Bros., Ltd., Cone Works, Farnworth, near Bolton, are paper bag makers and printers who, with up to-date machinery, do a pushing business, and supply an excellent quality of goods to the trade. Those who desire a profitable line should certainly secure Messrs. Higham Bros.' samples and price list.

T. J. Hunt, 17-18, Paradise-street, 13, Garlick-Hill, E.C., and 18, Goldsmith-street, W.C., London.—Mr. Hunt works for the trade, and is an account book manufacturer, machine ruler, numerical printer, perforator and wire stitcher, etc., who makes speed in getting out orders a feature. Mr. Hunt has acquired the old-established business of Messrs. Wm. Ludbrook and Sons, of 18, Charterhouse-buildings, E.C.

Klugmann and Co., 47, Basinghall-street, London, E.C., the sole British agents of the Mech. Bindfadenfabrik - Immenstadt, Immenstadt, Bavaria, manufacturers of grey, bleached, and coloured twines, cords, shoe-threads, net-yarns, and seamings. The best Italian hemp only is used in the firm's goods.

Edward Mortimer, Regent-street, Halifax, Yorks, is a publisher and stationer who is gratefully remembered by the trade throughout Great Britain and the Colonies for his helpful "Waistcoat Pocket Reckoner" and other trade publications for stationers. The firm is almost equally well-known as the publishers of "The Court" series of scoring cards and games and dance programmes, which are noted for their originality. The following departments are at work in the factory:—Letterpress printing, lithography, binding, relief stamping, block-making, technical photography, and plan-printing. They are the only workers of the "Veratype" true-to-scale plan printing process.

Moore's Modern Methods, Ltd., 4 (Dept. 56), St. Bride-street, London, E.C., are makers of loose-leaf record books in which to keep factory and professional records of all kinds on a labour-saving and handy reference system. Catalogues and trade terms may be had on application.

McCaw, Stevenson and Orr, Ltd., Linenhall Works, Belfast. London Office: **Shoe-lane, E.C.**—This is a well-known firm of colour printers who have a world-wide reputation for their imitation stained glass decorations, which are in use almost everywhere. The firm has purchased the patents, copyrights, watermarks, etc., of Marcus Ward and Co., and now produce and supply on a larger scale, and in addition to their own extensive manufactures, the specialities for which that firm was famous, including calendars, programme, menu, and memorial cards, diaries, albums, school books, birthday books and the popular "Royal Irish Linen" note paper. The firm has introduced a new style of show card mount that is most effective in appearance, and that will not warp with heat or damp. Messrs. McCaw, Stevenson and Orr have branches at Glasgow, Manchester, Birmingham and Hamburg.

E. M. Richford, 9, Snow-hill, London, E.C.—This house occupies a premier position amongst makers of rubber stamps, daters, rubber-faced type, self-inking pads, etc. A speciality is made of rubber stamp making machines and supplies for the stamp trade, especially for India and the Colonies. Many of their productions are covered by patents. A feature is made of promptitude in filling orders.

Shaw-Walker, Ltd., 33 (Dept. 56), St. Bride-street, London, E.C., supply an extensive assortment of letter filing devices, card index systems, and similar office and factory supplies. Indexing methods are becoming most popular in business circles, and the commercial stationer will find a profitable line in handling them. The firm want agents everywhere and will send terms on application.

W. E. Smith, Ltd., Sydney, N.S.W.—This is one of the largest and best equipped printing and stationery houses in Australia, and we have several times noticed in our columns the high quality of the work done. The firm is desirous of keeping the extensive works thoroughly up-to-date, and for this purpose invites correspondence from engineers, papermakers, and the fancy trades. Catalogues, lists, etc., can be sent direct to Bridge-street, Sydney, or to the London office, College Hill Chambers, College-hill, E.C.

Raphael Tuck and Sons, Ltd., Raphael House, Moorfields, London, E.C., issue illustrated catalogues which give a vivid notion of their lines, embracing pictures and frames, books, presentation cards, chromo and oleographs, plaques, mantel ornaments, texts, valentines, Christmas, New Year, Easter, birthday and private cards, calendars, etc. Their fine art toy books are ingenious and popular, and a splendid series of illustrated post cards is issued and continually being added to.

Weise Bros., 5-7, Singer-street, Finsbury, London, E.C., manufacture all kinds of gold and silver blocked advertising tablets, embossed blanks for ticket writing, gold blocked and other varieties of embossed calendars and date cases, club fixture cases and season tickets, coat badges in leather and celluloid, gold blocked perfumery labels, embossed catalogue and brochure covers, cameo embossed show-cards, silver blocked text and verse cards, embossing and blocking on celluloid, plush advertising tablets with embossed lettering, cut out window card signs, art floral advertising novelties and wood veneer show cards. They also undertake designing, engraving, aerographing, etc.

PENMAKERS.

John Heath and Co., 70, George-street, and 31-33, Newhall-hill, Birmingham, are noted for the high quality of their steel pens. The founder of the firm, Mr. John Heath, was one of the pioneers of the penmaking industry, and his firm has ever been in the front rank. Steel pens for every purpose are made, and to suit all hands, and among them may be specially noted the "Telephone" pen (No. 0,278), the "Favourite" (No. 1,899), "Postal Telegraph" (No. 1,880), "Ledger" (No. 508), "Ye Olde Court Hand" (No. 1,874), the "Barrister," and a fine series of the popular J pens.

TRADE BOOKBINDERS.

Geo. Edwards and Co., 28, Warner-street, Mount Pleasant, London, E.C., is a letterpress and account bookbinder to the trade, and undertakes these classes of work in all styles. Enquiries for terms will be appreciated and estimates given.

Nickerson Bros., 99-101, Worship-street, E.C., and Alscott-road, S.E. (London), are makers of all classes of leathers for the bookbinding trades, and supply acid free. Moroccos and pigskins to suit the requirements of the Society of Arts specifications. Quotations for supplies can be had on application.

Walter Newbury, East Ham Binding Works, Essex, makes a feature of public library binding, and binds books in sealskin, morocco, pigskin, etc., according to the Society of Arts recommendation.

Charles J. Forward and Son, Ltd., 25-27, Sayer-street, New Kent-road, London, S.E.—A firm of wholesale bookbinders and leather case manufacturers that turns out good work by means of modern plant, skilled staff, and personal supervision. A special feature is made of leather bindings. The firm, which was established in 1852, has been awarded several gold and silver medals and other distinctions for the excellence of its work.

BOOKBINDERS' SPECIALITIES, ETC.

Aug. Brehmer, 12, City-road, London.—We should suppose that there is hardly a good house in the trade that is not practically acquainted with the merits of Aug. Brehmer's patent automatic wire stitching machines and binders. He makes a wide range of them, from the cheapest treadle form at a few pounds to the most powerful, equal to driving a staple through an inch of the hardest paper. Mr. Brehmer supplies several high-class thread stitchers, adapted to the finest classes of work, as well as every description of bookbinders' machinery. His new folders are excellent machines. Mr. Brehmer's inventive faculties are cosmopolitan, his trade list containing perhaps a wider variety of this special class of requisites than any other upon our shelves.

British Loose Leaf Manufacturers, Ltd., 25, Finsbury-street, London, E.C., are manufacturers and patentees of all kinds of loose leaf metal parts, steel and aluminium ledger metals, transfer metals, pocket book metals, etc. They also supply complete books when desired. Catalogues may be had on application, and the firm supplies only the stationery trade.

Ibbotsons Limited, 64, Goswell-road, London, E.C., manufacture and supply a fine range of leather papers in all grains, qualities, and colours. Their sample book is indispensable to binders and fancy goods workers, showing as it does a remarkably complete and varied selection.

G. H. Maddin and Co., Ltd., 10-11, Middle-street, Long-lane, London, E.C., are makers of blocks and types for bookbinders, gold blockers, etc They make a specialty of cutting dies for embossing.

Digitized by Google

Minton and Casey, 1, Clerkenwell-road, and 23 and 24, Charterhouse-buildings, E.C., are die-sinkers and engravers by electric power, for bookbinders, gold blockers, stationers, etc. Special machinery is used, and all work is turned out promptly.

George Morris, 291, City-road, London, E.C., stocks bookbinders' specialities in colours varnishes, gold and silver leaf, etc., and holds a large stock of ruling ink powders, blocking powders, varnishes, gold leaf and gold leaf substitutes, marbling colours, albumen, glaire, gums, and all other requisites used in the bookbinding trade.

L. Nettleton and Sons, St. Helena-street, Farringdon-road, London, W.C., are the oldest established cast brass type founders in the United Kingdom. They manufacture superior brass type and cast handle letters of many useful designs; and also engrave handle letters, rolls, tools, pallets, etc. Type-holders to suit the requirements of bookbinders, gold-blockers, etc., are made in various styles, and all kinds of refacing and recutting are executed by the firm at very reasonable charges. Liberal terms are given to exporters and dealers.

T. Williamson and Co., 8, Palace-square, Manchester, manufacture bookbinders' cloths, label cloths, mulls, cambrics, linen, buckrams, blue linings, lithographic cloths, calicoes, emery cloths and photographic cloths, etc., of excellent quality. Samples and prices are sent free on application.

ROLLERS AND ROLLER COMPOSITION.

"The Durable" Roller Co., Ltd. (E. T. Marler, Manager), **Charles-street, Hatton-garden, E.C.**—This company revolutionised the old formula for printers' rollers. The firm originated in 1868, and introduced the casting of rollers by machinery in 1886, from plant of their own designing, and have brought the same up-to-date. The "Durable" rollers are known everywhere, and have taken the highest awards wherever exhibited, as at the International Inventions Exhibition, 1885, and at numerous Colonial exhibitions. Great care is taken in suiting the composition to the climate in which it is to be used. The "Durable" is sent out in slabs ready for use, with a set of instructions and a little sound advice in a work called "The Right Hand of the Press," which every practical man must appreciate.* The rollers are equally adapted for fine art work, colour printing, or all-round ordinary printing; they are usable for remarkably long periods and always keep in condition. The Hoe Rotary machines for the *Daily Telegraph*, *Lloyd's News*, *Daily Chronicle*, *Daily Express*, *Standards* (day and evening), and a host of similar machines have their rollers clothed by the company; and in a finer grade of work such as in the *Queen*, the *Gentlewoman*, *Strand Magazine*, etc., and kindred highclass work, the company's rollers also come into play. Their advertisement appears regularly in this paper, and we may mention that their rollers have been used on our machines for printing this issue, we having used this make for considerably over twenty years.

*Sent free and post paid anywhere upon request.

Fredk. Heywood, junr., Inkermann Works, Honey-street, Cheetham, Manchester; Works also at 26A, Claypit-lane, Leeds, manufacturer of printers' rollers, has not only been enterprising enough to rebuild and remodelhis works in Manchester into an up-to-date roller factory, but has also erected a similar plant in Leeds, and claims to be the only firm which has two installations of this kind in different parts of England. The "Inkermann Composition," which is being used in the largest newspaper offices in the world, has proved itself to be excellent for use on fast-running machines, and has obtained a great many unsolicited testimonials, whilst the "Midas Composition" has made a name for itself on cylinder machines.

J. R. Thompson and Co., Wharfedale Roller Works, Otley, Yorks, are manufacturers of printers' rollers and roller composition, the fine qualities of which have secured for them numbers of entirely unsolicited testimonials, and for fine colour work they are all that could be desired. The firm also manufactures stereo mounting boards in mahogany, canary white wood and oak, at reasonable prices. Lists will be sent on application. They inform us that they are constantly making new accounts, and number amongst their customers many of the best houses in Leeds, Bradford, Edinburgh, Glasgow, Perth, Aberdeen, Belfast, Leicester, Birmingham, Reading, and numerous other large towns throughout England and Scotland. Many of their rollers returned to be re-cast have done upwards of two years' service. They challenge comparison, and do not mind how small the order may be, which is submitted as a test, either for a dry or damp office.

PRINTERS, ETC., TO THE TRADE.

Baylis, Lewis and Co., 5, New-street, Worcester, make a special feature of their "Worcester Artistic Embossed Circulars and Cards," "In Memoriam" cards, ball programmes, etc., and samples of these may be had through the wholesale stationers, or direct from the firm.

The Bell Punch and Printing Co., Ltd., London, supply all kinds of tickets, cheques, etc., consecutively numbered in books, packets, or rolls, suitable for railways, tramways, omnibuses, steamboats, concerts, theatres, football, cricket, and other clubs, etc., at extremely low prices Those printers, who can secure such work may profitably turn it over to the company.

T. E. Bingley, High-street, Leicester.—Trade work in lithography is done by Mr. Bingley, whose four points are strict faith with customers, perfect quality, promptitude in execution, and moderate charges.

Blades, East and Blades, 23, Abchurch-lane, Lombard-street, London, E.C.—Cheque printing under a special system known as "Protective" is done by this house. It is a chemical process, and protects against forgery. The firm executes trade orders (for quantities) by their special mechanical processes and water colour ink, doing only the best work in any colour, including black. The dependability of the house and the probity of its dealings are unquestioned.

Tom Broad, 76-78, Clerkenwell-road, London, E.C., is a thoroughly reliable lithographer, engraver, and copperplate printer to the trade, he has an extensive plant and commodious premises, and possesses every qualification for the production of the highest as well as ordinary classes of lithography, is very moderate in his charges, and his clients in the trade bear testimony to his punctual performance of promises. Despatch in business is the "broad" principle of the firm.

Cooper and Budd, Ltd., McDermott-road, Peckham, London, S.E.—A well-known firm of printers, noted for their high-class work. They undertake every description of high-class letterpress printing for the trade, and execute it at moderate prices.

G. Cornwall and Sons, Aberdeen.—An established and well-known firm of general printers and lithographers. A speciality is made of all kinds of labels printed in colours from block or stone, for jam preservers, biscuit manufacturers, tinned provision manufacturers and others.

Thomas Forman and Sons, Nottingham, are litho and three-colour printers, whose work is well known all over the world. The firm's calendars for 1914 are of a very high quality, artistically and technically, and should be seen by all who can sell such things.

Percy Bros., Ltd., The Hotspur Press, Whitworth-street West, Manchester.—A feature of this firm's business is the setting up of heavy solid composition on the Linotype and Monotype machines, and they have a neatly got-up booklet showing all the sizes they can set up, from nonpareil to pica, with and without heavy faced type. The firm undertakes machining for the trade on rotary and two-colour machines, also folding and stitching pamphlets, etc.

Perkins, Bacon and Co., Ltd., Southwark Bridge-buildings, London, S.E.—This well-known house, founded in 1819, at Fleet-street, whose fine works were described and illustrated in our issue of March 30th, 1905, have recently relinquished letterpress printing, and now confine themselves to their original trade of the siderographic engraving and printing of bank notes, postage stamps, trading stamps, security cheques, debentures, bonds, share warrants, and certificates, and similar work, which they execute both by steel plate, litho and surface printing as required. They make a special feature of trade engraving and printing in the case of the documents above mentioned, and the good standing of the firm is a guarantee that all trade orders will be strictly and faithfully carried out. Stationers and printers doing company work who do not keep their own engravers cannot do better than entrust their engraving to this firm. Rotary offset litho work is also done.

Petty and Sons, Limited, Leeds and Reading, are printers to the trade who make a speciality of illustrated advertising for various trades. Their facilities for litho trade work are of an extensive character; they are specialists in picture poster work—and litho label work—in all grades. The firm hold a large selection of copyright designs, and execute any order, large or small, with despatch. Their facilities at Whitehall Printeries, Leeds, include 100 letterpress and litho machines, rotary and two-colour for fine art printing; their Monotype installations and other labour-saving facilities, with a staff of over 500 employees at Leeds, and 250 at Reading, enable them to undertake large contracts. Features of their business are strict faith with customers, low prices, high-grade work, and speed.

Priestley Brothers, Ltd., 189, Great Dover-street, London, S.E., near St. George's Church, are a City firm who lay themselves out to do printing for the trade. Their factory is at Warren-place, and from its central situation work can be delivered promptly.

D. F. Tayler and Co., Ltd., New Hall Works, Birmingham.—All kinds of fine chromo-lithographic and letterpress printing are undertaken by this firm, and whilst they do a large business in posters, showcards, manufacturers' pattern books and labels, etc., they are specially noted for being producers of chromo pictures and almanacs of a high-class character. They have a number of novelties in pictures and calendars for the coming year.

Taylor Brothers, Sovereign-street, Leeds.—Messrs. Taylor Brothers' specialities are noted for their variety, excellence of design and fine execution. Their chromo sheet calendars are issued in beautiful colourings and in monotone, and embrace a large selection. The 1914 series is now ready. In their chromo card calendars, letter racks and pocket calendars a vast business is done, new designs being constantly added. Award certificates for schools, swimming clubs, agricultural shows, and other purposes, bordered blanks on paper and card in all sizes and styles are also supplied, as well as illustrated showcards, etc., posters and window bills, advertising, football and cricket sheets, illustrated and comic handbills and puzzle cards. The production of pictorial post cards of customers' own selection, from own negatives or photos (a coloured sketch not being necessary) is a leading feature. The making of half-tone, line and tri-colour blocks as well as photo-lithography in all its branches is carried on upon an extensive scale. "In Memoriam" cards, transparencies for window decoration, and for advertising purposes are a leading line. Lithographed poster work up to 62 by 42 is a speciality, either the designing, the drawing and the printing of the job complete or any part of it, and every description of litho and letterpress printing is undertaken. Varnishing by machine, metal and wood mounting, ruling, punching, numbering, and in fact everything connected with the trade is executed in the works.

Wertheimer, Lea and Co., 46-47, London Wall, and Clifton House, Worship-street, E.C., are a firm of printers in French, German, Russian, Hebrew, and all foreign languages. They offer facilities for this class of printing which will be appreciated by the trade.

Widdowson and Co., Millstone-Lane, Leicester, are trade printers who make a speciality of monthly date blocks for calendars and lithographic colour work. Their prices are very low considering the quality of their work, and the advantage of being able to secure ready printed blocks should be appreciated by every calendar printer and stationer requiring complete calendars for customers, as they can have the whole work executed with promptness.

WOOD, PROCESS, COPPERPLATE, and STEEL PLATE ENGRAVERS, DESIGNERS, Etc.

Baddeley Brothers, Chapel-Works, Moor-lane, E.C.—This firm is a reliable one to entrust with seal engraving, die-sinking, and the supply and embossing of private and commercial stationery—they make a speciality of menu card, ball programme, and wedding card blanks for printers.

Badoureau and Jones, Ltd., Poppin's-court, Fleet-street, London, E.C.—One of the best known firms of electrotypers, stereotypers, and general engravers in the trade, whose record extends back to 1876, when wood engraving had not been supplanted by the process block. They turn out good work rapidly and are reasonable in their prices. The firm still carry on the department of boxwood block manufacturers.

Digitized by Google

W. and G. Baird, Ltd., Belfast.—The printers and publishers of the *Belfast Telegraph*.—New and specially erected premises fitted with the latest American machinery are utilised by the firm for the production of process blocks in line and half-tone, on zinc or copper. Litho or copperplate transfers are a speciality.

Century Engraving Co., 21, Cannon-street, and Greenwood-street, Manchester, is one of the best known trade firms in Manchester and "up north" of artists, designers and engravers. Their work covers a wide range of production: bonds, shares, cheques (a feature), letter and invoice headings, cards, views of works, and factories, vignettes and figures engraved on copper, steel plates, and steel dies, also reversed engraved plates for offset machines. Christmas cards in two, three and four colours, die work, menus, book labels, catalogue and booklet covers, decorative panels for posters, etc. In addition to the copper, steel and die departments, the firm have also plate printing, lithographing and die-stamping departments. Their artists are prepared to make sketches and drawings in colour, wash and line for all engraving processes and requirements. That their work is appreciated is clearly shown from its variety and the extent of the field it covers, this firm, besides doing a United Kingdom trade, are now securing enquiries and orders from various towns in India, East and South Africa, the Continent, etc. Printers and stationers who desire good work at a fair price, combined with quick delivery and immediate attention to enquiries and estimates should make a note of such a useful concern. Specimens and booklets with prices will be sent on receipt of a post card.

James Dellagana and Co., Ltd., Turnagain-lane, Farringdon-street, London, E.C., are newspaper, book and fine art stereotypers, electrotypers, and process engravers. The work done at the Viaduct Foundry is of a high quality, and speed in delivery is made a feature of the business. Electros delivered in three hours from receipt of original. The firm has no other address.

A. E. Dent and Co., Ltd., 7, Broadway, Ludgate-hill, London, E.C., are makers of process blocks in line, half-tone, and for colour work. Their work is well known for its high quality, and they send specimens to those interested on application.

Direct Photo-Engraving Co., 38, Farringdon-street, London, E.C., is a well-known process house, turning out good work in line and half-tone, and undertaking every description of photo-process reproduction. The firm was established in 1882, so that its reputation is not a thing of yesterday. Prices and specimens are sent on application.

T. E. Downey, 63, Berners-street, Oxford-street, London, W., is a copperplate engraver and process block maker who does good work. He keeps electros in stock for various trades.

Eyre and Spottiswoode, Ltd., New-street-hill, London, E.C., the well-known firm of printers, have an Electro Department where they produce single and colour electros by the Albert-Galvano method, which ensures the duplicate being an exact duplicate, and, mounted or unmounted, is claimed to be equal in every respect to an original.

The Guild of Printers' Designers, 84, Atlantic Chambers, Brazennose-street, Manchester.—This is a firm that pays special attention to the artistic production of showcards, calendars, catalogue illustrations, circulars, commercial stationery, and illuminated manuscripts. They will illustrate every variety of article for catalogues in black and white or colours, wash or line drawings, direct or from photographs; make a speciality of old style designs, lettering, writing, etc., for circulars and such like, and they claim to stamp all their work with an individuality which raises it above the general level.

Carl Hentschel (1906), Ltd., 182, 183 and 184, Fleet-street, London, E.C., have fitted up one of the most complete ranges of studios and offices in the metropolis. It is equipped with every appliance which experience can suggest or a liberal expenditure can command. There are installations of the electric light whereby photographic work can be proceeded with on the darkest days, and right through the night. In addition, the company have a process of reproduction entirely their own, which has been adopted by some leading London illustrated papers. Additional extensive premises have been opened at the Hentschel Foundry, in Goldsmith-street, Gough-square, E.C., where electrotyping and stereotyping are carried on with the most approved plant and machinery. The works are open day and night. Very fine three-colour blocks, by the

Hentschel Colourtype process, are also turned out by the firm, which incorporates the Meisenbach Co., Ltd., of West Norwood, S.E., a pioneer house in the photo-engraving trade, a "Meisenbach block" being still a synonym for a half-tone cliche produced by photographic means. This branch has well equipped studios, and is thus able to produce process work of all kinds, including poster portraits, cover designs, half-tone photogravure, and blocks for the three-colour process. The work turned out is of the highest quality.

E. Hulton and Co., Ltd., Withy-grove, Manchester.—A firm of high-class photo-engravers, who include in their category the production of three and two-colour work, combined half-tone and line blocks and "Sketchlight" half-tones which give a brilliant effect, away altogether from the commonplace half-tone results. They also make a special class of block for headings of commercial stationery; the results closely resemble die-press work, the great advantage in the use of these being that art papers are not necessary, in fact, finest results are obtained on papers such as bank and antique. The blocks will work quite easy on the ordinary platen type. It would be worth while for printers to see specimens of this class of work and obtain further particulars.

S. W. Partridge and Co., 21-22, Old Bailey, London, E.C., the well-known publishers, supply electrotypes for illustrative purposes, from the extensive and valuable stock of engravings created in connection with their numerous illustrated publications. Messrs. Partridge and Co. are not electrotype collectors and agents, but simply offer—to Colonial houses in particular—the advantage of their great resources in artistic engravings, covering most fields of literature, and for the most part at one-tenth the cost of the original drawings. Local magazine proprietors should be quick to grasp the advantage of such a source of illustration.

C. H. Read and Co., 98, Cheapside, London, E.C., are draughtsmen and engravers on wood, electrotypers, etc., and have a good selection of stock electros for trade purposes. The firm also makes a feature of touching-up half-tone and other blocks that may have been damaged in working, or otherwise.

Richardson and Co., Waterloo-street, Leeds, are electrotypers and stereotypers in all branches, and make a speciality of vignetted and three-colour electros by a special process that is guaranteed to give results equal to originals. Specimens and price list will be sent on application.

W. F. Sedgwick, Ltd., 236-7, Blackfriars-road, London, S.E., make a feature of the best half-tone, three-colour and line work. They also undertake designing and artistic work in connection with the production of high-class illustrative or advertising work.

John Swain and Son, Ltd., Columbia House, 89-90, Shoe-lane, London, E.C.—This famous firm of process engravers is well known in the printing world, its founder, the late Mr. John Swain, being a pioneer in the art of photo-mechanical engraving, and a Swain block embodies all the qualities that command the admiration of the printer. The firm recently entered on occupation of fine new premises at the above address, an illustrated description of which appeared in our issue of December 9th, 1909, and are fully equipped with the latest and most approved appliances for turning out the highest class of work in the shortest time. They have opened a branch house at 12-14, Bath-street, Glasgow.

H. J. Sheldon, 32, Museum-street, W.C., is an engraver and electrotyper who makes a feature of electrotype reproductions from bank-notes, bond and cheque plates, etc., for printing purposes. He also makes special protective surface blocks for printing micro-cheque bands, scrolls, and other fine work. A speciality of the firm is making duplicate copper plates steel-faced, for work on the Hoe copper-plate printing machine. At the Printers' Exhibition, 1904, London, they obtained highest award and silver medal for their work then exhibited.

H. G. Walker, 65, Bayswater-road, Birmingham.—This firm specialise in stock blocks for note heads. Also dainty designs suitable for bazaars, circulars, advertisements, calendars, blotters, showcards, picture post cards, etc.

PAPER BAG-MAKING MACHINERY.

Bumsted and Chandler, Ltd., Cannock Chase Foundry, Hednesford, Staffs, make a speciality of paper bag-making machinery suitable for general printing offices, and designed to produce bags of varied sizes and weights from the web of paper. The patented machines of this firm have recently been simplified and improved, and the statements issued concerning their capacity ought to be of practical interest to printers in all countries, where it does not always pay to stock a great number of sizes and classes of bags.

PHOTOGRAPHIC, Etc., PUBLISHERS.

Valentine and Sons, Limited, Dundee.—This firm's photographic publications are widely known, both at home and abroad, comprising as they do nearly every class of photographic work. They claim to have the largest colour and collotype plant in the kingdom, and issue about 100,000,000 colour and black and white post cards a year. They employ in their different establishments about 700 workpeople.

PAPER MILL ENGINEERS.

Bentley and Jackson, Ltd., Bury, near Manchester.—"Thou hast built a paper mill"—*Shakespeare*. This quotation dates back before the business of papermakers' engineers was established, but if the firm of Bentley and Jackson had then existed, doubtless they would have pioneered the industry. This firm have built the machinery for some of the largest mills in Great Britain, Norway, Sweden, Germany, France and the United States; an acknowledgment that they are good engineers, and well know how to plan a paper mill, and to properly equip it with the latest plant. They have made a considerable success of mills designed for India, China and Japan.

AUCTIONEERS and VALUATORS.

Frank G. Bowen, 62a, Aldersgate-street, London, E.C., is well known in the trade as an experienced valuer of printing plant and machinery. He also carries on a successful business as trade auctioneer.

Frank Colebrook, 146, Fleet-street, London, E.C.—Mr. Colebrook carries on the business of valuer for the printing, paper and stationery trades. Mr. Colebrook has had over thirty years' experience in printeries, four of these in responsible positions in the block-making world. He assists manufacturing houses in any line in the compilation and display of their own advertising catalogues or booklets, they printing them where they choose. Some old-established and very important printeries and firms supplying printers are among those who have used his help in this sense.

Robert H. Ruddock, 71, Fleet-street, London, E.C., is an auctioneer, valuer, and fire loss assessor to the printing and allied trades. Mr. Ruddock has had considerable experience in these branches, and his services are at the disposal of clients.

PRESS CUTTING AGENCIES.

Durrant's Press Cutting Agency, 32-34, Holborn-viaduct, and 3, St. Andrew-street, London, E.C., supplies press cuttings for any purpose promptly, and at cheap rates.

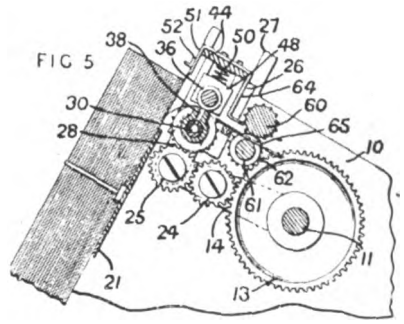
Woolgar and Roberts, 58, Fleet-street, London, E.C.—A general press cutting agency supplying information and press cuttings upon any subject smartly, and at moderate prices.

WIPERS and DUSTERS.

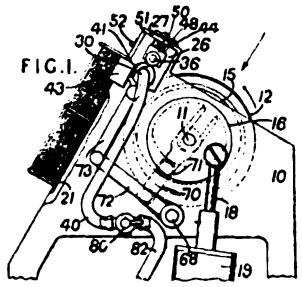
Jacobs Brothers and Co., Portpool-lane, Gray's Inn-road, London, E.C., supply printers, lithographers, engineers, etc., with "wipers" of every description, guaranteed clean and free from buttons, pins, etc. Prices and particulars are sent free on application.

ADVERTISING AGENTS.

Neyroud and Son, 14-18, Queen Victoria-street, London, E.C. (same address since 1881).—A firm of advertising agents that has international connections. It is old established, the office having been opened in 1875. Sole agents for Rudolf Mosse, German advertising firm, since 1875, also sole agents for *Kolnische Zeitung*, etc.



MISCELLANEOUS.



W. R. Perry, Ltd., Bush-lane, Cannon-street, London, E.C.—This firm, one of the oldest trade protection offices in the United Kingdom, makes status inquiries as to the position and standing of traders and others, and possesses registers at the offices, containing full bankruptcy and other information for Great Britain and Ireland.

F. Lincke and Co., 28, Paradise-street, Virginia Buildings, Liverpool, manufacturers of "Flexityp" dry flongs for stereotypers, that save gas, time and money, and are claimed to be absolutely reliable.

Feeding from a Pile.

In a machine for feeding sheets from a pile, invented by Mr. H. B. Cooley, and particularly applicable for feeding envelopes to printing, counting, banding, and like machines, the pile is supported on an inclined table 21 on a frame 10 which provides bearings for a main shaft 11 driven by a pulley 12. Adjacent to the top edge of the pile is a hollow suction shaft 30 with a nozzle 38, mounted in blocks 26 sliding in bearings 27, and having a pinion 41 which meshes with a stationary rack 43 on the frame. The blocks 26 are connected by links 73 with levers 72, pivoted on a shaft 68 and oscillated by a fork 70 which embraces the shaft 11 and carries a roller 71 engaging a groove in a cam 15. The hollow shaft 30 is connected by a flexible pipe 40, a three-way cock 80, and a pipe 82 to an oscillating pump cylinder 19, the piston 18 of which is operated from a crank disc 16. The cock 80 can be turned to cut off the suction from the separator and open the pump to the air to relieve the load. Mounted loosely on

the shaft 11 are arms 14, which are connected by links 28 to the blocks 26 and carry idle pinions 24, 25, driven from spur wheels 13 on the shaft 11 and gearing with pinions 32 on feed rolls 35 located on the shaft 30 on each side of the suction nozzle 38. The rolls 35 are cut away around a part of their periphery to form an opening through which the sheet is fed. The rolls 35 co-operate with a roller 36 mounted in bearings 48 sliding in the blocks 26 and held in contact with these rollers by a spring 50. To ensure even running, the shaft 30 and the roller 36 are furnished with co-acting collars 46, 47. Secured to a plate 44 attached to the blocks 26 is a plate 51 having a curved end, which, when the blocks 26 are lowered, enters between the separated sheet and the rest of the pile and serves to guide former between the rolls 35, 36. As the plate descends, a stop 52 thereon engages the edge of the pile. The rollers 35, 36 feed the sheet on between guides 64, 65 to rollers 60, 61, which are driven by gearing from the wheels 13.

A MUSEUM OF ARTS AND INDUSTRIES.—In compliance with the wishes of some important associations, the Spanish Minister of Public Instruction, has decided to found, in Madrid, a National Museum of Industrial Arts, organised on essentially didactic and popular lines. The new museum will be in the Palacio de Cristal del Retiro, and will contain works of antiquity, the middle ages, modern and contemporary times, both national and foreign. Lectures will be given and prizes offered to encourage the artistic industries. Circulating collections will be formed and catalogues published to extend the sphere of work as much as possible. There will be a committee of twelve members to deal with matters relating to the museum, the Inspector-general of Fine Arts and the directors of the Schools of Arts and Crafts of Madrid.

PERFECTED BRONZING MACHINE

(Patent "KOHLBACH,")

At Work in the Finest British and Foreign Printing Works.

The speed of this Machine is enormous owing to the absence of cylinders, thereby also doing away with all fear of gripper marks.

Contrary to the Dust Exhaust system of other makes, the used bronze does not pass back into the machine, but collects in a box, thereby ensuring first class work.

By the system of wipers a very much brighter result is obtained than by the system of rollers. The Machine will not only bronze and dust paper but any thickness of card. The rollers are automatically cleaned whilst the machine is actually at work.

A FEW OTHER SPECIALITIES:

Book Sewing Machines. "Marvel," for smaller runs at £60 for Treadle, or £75 for Power;
the **"Rapid"** for Letterpress Binding,
the **"Universal"** for sewing all classes of work, and
the **"Victory"** for extra heavy Ledgers, Endless Guard Books, etc.

Rotary Printing Machines for Jobbing Work, Newspapers, Catalogues, Art Printing, Cashblocks, etc.

Causes of the Discoloration of Paper.

In an abstract of a paper contributed by V. Schoeller to the *Wochenblatt für Papierfabrikation*, the author's conclusions are thus stated in the *Journal of the Society of Chemical Industry*.

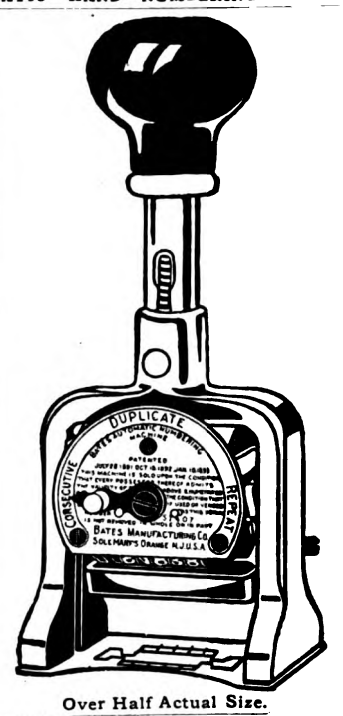
Papers turn yellow under the influence of long storage, air, light and heat. Comparative tests for this tendency are obtained by storing for at least a year, exposing to the action of air and light for about a week, or most rapidly, by heating in a steam oven at 95 degs. C. for 3, 5 or 30 hours, according to the stability of the paper.

Excluding the presence of mechanical wood pulp, two main causes of yellowing are recognised: sizing with rosin size and modification of the cellulose, *e.g.*, by the action of bleach liquor. The discolouring effect of rosin size may be two-fold; in the first place, the rosin itself, as an unsaturated body, darkens on exposure in the finely divided state as it occurs in the paper; secondly, when any considerable proportion of the rosin is in combination with iron, the resinate so formed causes a gradual darkening of the paper. Klemm has considered this latter agency as the main factor in the discoloration of papers, but the author shows that its influence is secondary to the darkening produced by the alteration of the rosin itself, and that it only becomes appreciable when the proportion of iron in the form of resinate exceeds 0·04 per cent. of the total rosin present. This proportion is twice as large as the outside limit occurring in practice with papers sized with commercial aluminum sulphate.

Experiments in connection with the alteration of the rosin, when heated in presence of air, showed that the darkening so produced is not a direct function of oxidation as measured by the decrease in iodine absorption value. Purified rosin acids, extracted by aqueous alcohol, show a greater tendency to darken in colour than the original rosin, yet the rosin acids possess a lower iodine value. Oxidation does occur during the heating, but it affects mainly some constituent which is not concerned in the darkening. Thus the iodine value of a sample of rosin is no indication of its tendency to discoloration.

The author found, however, that rosin can be stabilised by the action of chlorine. For this purpose, 5 kilos. of rosin are dissolved with 1,800 gm. of sodium hydroxide, the solution is diluted to contain 200 gm. per litre and precipitated with excess of hydrochloric acid. The finely divided precipitate of rosin acids is filtered off and introduced wet into a solution of bleaching powder of 10 degs. Bé. (sp. gr. 1·075) in the proportion of 1 kilo. of rosin per 10 litres of bleach liquor. The rosin contains sufficient acid to liberate the chlorine, and the mixture is allowed to stand for five to eight days. The treated rosin contains 16·9 per cent. of chlorine, and its iodine absorption value has fallen to 33; it readily forms a soap with sodium carbonate and, provided it be employed in conjunction with a good commercial grade of aluminum sulphate, it yields a sized paper which is practically stable in colour.

With regard to the condition of the cellulose, papers made from old worn rags are more likely to turn yellow than those made from sound or new rags; the strength of the bleaching liquor is of less account than the time during which the bleach is allowed to act on the half-stuff. The fibre should therefore be bleached with a moderately strong liquor, the chlorine neutralised and the soluble residues washed out before the half-stuff is stored. Discoloration may be due to the fading of tinting dye-stuffs employed to increase the brilliancy of white papers.



STATE PRINTING ESTABLISHMENTS.—The gross revenue from the German Imperial Printing Office last year was estimated at £579,580, as compared with £618,910 in 1911, and £657,653 in 1910. The estimated expenditure on the office was £425,438, against £437,574 in 1911, and £433,691 in 1910, so that the office brings in a considerable profit to the State, The Austrian Imperial Printing Office is also a money-making concern, though not on such a large scale. Last year the gross estimated revenue of the establishment was £366,666, and the profit on the year's working will probably be about £30,000, as in 1910, when the year's receipts were about the same, there was a surplus of £33,167. Some £6,000 a year is also derived from the Government official newspapers.

DURING last year work was done by the Long Eaton Co-operative Printing Society to the value of £1,178 and the committee have lately reduced the working hours to 49 per week.

Some Chromo Sheet Almanacs

And Card Calendars for 1914.

A fine collection of chromo sheet almanacs is produced by the well-known firm of colour printers, Messrs. Taylor Bros., Sovereign-street, Leeds, and a few samples of those they have prepared for 1914, which have just come to hand, contain ample evidence of the great resource and technical abilities of the firm in this particular line. There are ninety-two patterns in the collection, and the range of subjects is so wide and the sizes and styles so various that every buyer will find something to suit his requirements. The originals are, for the most part, by well-known artists, and have been very carefully reproduced by the latest methods.

Among the larger size almanacs (28 by 20 inches) is an upright picture entitled "A Highland Lassie," which is a capital reproduction in rich colours of a handsome lassie in Highland plaid shawl and tam-o'-shanter. The picture itself measures 19½ by 14¾ inches. The oblong almanacs include one called "The Huntsman's Daughter," showing a huntsman holding open a gate leading out of a copse into the open fields, through which is issuing a pretty little girl on a black pony. In another part of the foreground and in the distance are other hunters and the hounds in full cry. It is a pleasing and familiar country scene reproduced in a beautiful depth of colours. A delightful little study is the one entitled "You must be friends." It depicts a little golden-haired girl seated at afternoon

"You Must be Friends."

tea in a garden, a large terrier on one side of her having put its fore-paws upon the table upsetting the sugar basin, while on the other side of the little girl is a King Charles spaniel resting its head on the table, the two dogs looking jealous defiance at each other. An interesting study of Highland cattle is called "Feeding the Cattle," a group of these wild-looking animals being shown amid some bleak, snow-covered mountainous country.

A smaller size almanac measures 22½ by 17½ inches, and among them is a pretty domestic scene entitled "Jealousy." In a lowly kitchen interior a little boy is seated nursing a puppy, while two other dogs are showing palpable signs of jealousy. An elder sister is an interested spectator in the background. The dress of the figures, the utensils of the kitchen, the large open fire-place, and various other details are realistically rendered and excellently reproduced in quiet colours. "The Star in the East," portraying an Eastern scene with some shepherds gazing intently at a large radiant star above a distant city, is

"Feeding Time."

the subject of an admirable coloured lithograph. A couple of greyhounds within a few feet of a hare running for its life is entitled "A Close Call." The chase is effectively shown in the foreground on a fine sweep of sloping turf, with some pretty scenery in the distance. The followers of the hounds are seen just emerging over the brow of a hill in the middle distance. "A Fair Critic" is the title of a monotone study of a pretty girl examining a lily. The picture is oval in shape and set in an artistically designed frame printed in a dark shade of green.

A still smaller size measures 20 by 14 inches. They include a pretty scene of a country farmstead in the depth of winter, called "A Hard Winter"; a glimpse of a rural courtship in a byegone day, entitled "Two strings to her bow," a rustic scene of a pretty country lass feeding ducks at the side of a pond, reproduced from Yeend King's "Feeding Time," and a comic picture of a mishap to a dandy puntist on a fashionable part of the river, entitled "An Awkward Fix."

A series of handsome panel almanacs, measuring 28 by 11¼ inches, include a pair of sea views, "A Nor'-Easter (Scarboro')" and "Rough Weather (Whitby)," both of them admirable views of rough seas, and splendidly reproduced; a couple of classic female figure studies in charming colours, entitled, respectively, "Motherless" (the young lady is carrying a lamb) and "Phoebe"; also a pair of monotone panel pictures, "The Proposal" and "The Betrothal," two very cleverly conceived studies of figures in a costume of the past, and nicely reproduced in soft tones.

The attractive appearance of the sheet almanacs is considerably enhanced by the very artistic borders that appear round the pictures and give to them such a nice finish. They are printed in different tinted inks and the different styles are selected to harmonise with the character of the pictures. At the base of the pictures are neatly printed tabulated calendars for 1914.

In addition to the sheet almanacs Messrs. Taylor Bros. have an excellent collection of card calendars and letter racks. The former include a beautiful and extensive range of new subjects, the pictures which decorate the mounts, many of which bear tasteful designs, being excellently printed in colours. The mounts are composed of dark tinted card with ornamental or sunk border in the American style, and there are also some white enamelled cards, on which ornamental bordering is embossed in high relief. Each card is bevelled at the edges, and fitted with a clearly printed date block with figures in white on a dark green ground, and with suitable cord for hanging. Many of the pictures are reduced reproductions of the subjects depicted on the large sheet almanacs, and embrace seascapes, landscapes, domestic subjects, figure studies, hunting scenes, rural incidents, etc.

The letter racks are an attractive form of calendar, neatly and strongly made. The pockets have cloth gussets, the coloured pictures being mounted on the front portion, and they are attached to dark tinted cards.

"A Hard Winter"

Each letter rack is bevelled at the edges, and fitted with a clearly printed date block with figures in white on a dark green ground, and with a tinted cord for hanging. A few of both the card calendars and the letter racks are handsomely printed in gold and colours on enamelled cardboard. The size of these range from 12 by 9 inches to 15 by 11 inches, there being many different shapes, some in the narrow panel style and some the broad way in oblong shapes.

Digitized by Google

Two comprehensive catalogues are issued by the firm, showing miniature illustrations of the almanacs and calendars respectively, and giving details of the size of the sheet and the size of the picture in each case.

Tariff Changes

AND

CUSTOMS REGULATIONS

(From the "Board of Trade Journal").

BRAZIL.

According to the Budget Law for the present year, waterproof paper bags for sugar and other agricultural products are now dutiable at 8 per cent. *ad val.* Prospectuses, bills and placards exclusively for use as advertisements for gratuitous distribution, pay only 150 reis per kilo., but if they have illustrations they have to pay duty under No. 604 of the Tariff.

UNION OF SOUTH AFRICA.

The Board of Trade are in receipt of information from H.M. Trade Commissioner in South Africa respecting a Customs decision by the Union Customs Department, which fixes the duty leviable on tram tickets, with and without advertising matter printed thereon, on importation into the Union, as follows:—

Article.	Tariff Heading.	Rate of Import Duty. Under the General Tariff.	Rebate of Duty allowed on Manufactures of the United Kingdom and Reciprocating British Colonies.
Tram tickets - With advertising matter printed thereon	43 (a)	25 % ad val. or 2d. per lb. (whichever rate returns the higher duty)	3 % ad val.
Without advertising matter printed thereon	175	15 % ad val.	3 % ,

ITALY.

It is announced that machines for the formation of crude plates (*lastre greggie*) for stereotyping, consisting of (1) a boiler for the fusion of the lead, with an internal mixer, worked by an electric motor (not presented for Customs clearance with the machine), (2) two hand pumps for passing the melted lead from the boiler into the "formes," and (3) the "formes" for the plates are dutiable under No. 310 (*n*) of the Tariff at 4s. per cwt. as "machines not specially mentioned." A case recently came before the Customs authorities for decision in which an imported medicinal product, dutiable under the head of "compound medicines not specially mentioned, other, non-alcoholic," was contained in glass bottles, which were placed together with a sheet of advertising matter printed in Italian, within a triple covering of paper, the one in the middle (the stoutest) consisting of two sheets of straw paper (one corrugated) glued together and cut in a special shape so as to fit it to hold the bottle and protect it from damage. Such medicines are dutiable without deduction of the weight of the "immediate receptacles," and the dispute turned upon the question whether the "immediate receptacle" was the glass bottle alone or the bottle *and* the triple covering of paper (with which the goods were destined to be sold retail). It was decided that the "immediate receptacle" was the glass bottle which contained the product, the triple covering of paper not being a "receptacle" but "packing." Consequently, the advertising sheets (not forming part either of the medicine or of the packing) were assessed for duty separately under Tariff No. 250 (*a*) 1—"unruled white paper, printed," at 6s. per cwt.

BELGIUM.

It is stated that in determining the tariff classification of blotters (*buvards ou sous-main*) of cardboard or paper, any printing, whether typographic or lithographic, which may appear on the exterior surfaces of the cover is left out of account. But the interior surfaces of the cover are to be regarded as forming part of the interior of the article; and any typographic or lithographic printing on such interior surfaces entails the classification of the goods as typographic products, or lithographic products, as the case may be.

The Deal Home Musical Society.

This society is inaugurated to aid the funds of the Lloyd Memorial Seaside Home, at Deal, the latest institution connected with the allied trades. The concerts are held bi-weekly at the Falcon Hotel, Gough-square, E.C., and are free to anyone who can attend them. The talent is exceptionally good.

On Friday last the chairs were occupied by Mr. J. A. Wylie, of Messrs. J. A. Wylie and Co., the well-known silversmiths, of Holborn Viaduct, and Mr. W. A. Lott, of the *Times*. The chairmen were supported by the chairman of the Home, Mr. T. H. Newnham, Mr. H. W. Howes, the genial secretary of the Machine Managers' Trade Society, Mr. Ben Chase, and several well-known men in the allied trades.

The concert opened with an overture by Mr. H. A. Cooke (of Novellos), who is an ideal accompanist. An exceptionally good turn is Mr. Charles Ross, whose fine baritone voice was heard to great advantage in "Tommy Lad," the singing of which, especially in the chorus, was very effective. Miss Violet Renton is a comedienne who always scores, and her songs met with great applause. Mr. Harry Sargent is one of the best-known humorous turns south of the Thames, and his rendering of "They Call Me the Major," was both original and clever; the applause at the conclusion of the song was a just recognition of the artistic efforts of the singer. Mr. Ernest Haywood is a Scotch comedian whose imitations of Harry Lauder never fail to secure an encore. In evening dress this artiste is able to give all the effects of a character song, whilst his Scotch accent adds greatly to the charm of his singing; his song "Just a Wee Deoch-an-Doris" was particularly well rendered and applauded.

It is seldom that a child performer is an acquisition to a concert, but an exception was found in a pretty little child of some seven or eight years of age, singing under the name of Miss Dorothy Maude; although she has had but little training, Dorothy had the mannerisms of an old professional, and her singing of "Joshua" was quite a revelation to the artistes present, who were unanimous in the opinion that the child is specially gifted. She was accompanied by her sister, Miss May Maude. Dorothy also gave an exhibition of her skill as a dancer, and was loudly applauded. Mr. Norman Browne's fine bass songs were extremely well received. The other artistes were Mr. Harry Warren, Mr. Albert Piper, Mr. Harry Piper, Mr. Frank Clark, Mr. Ernie Evans, and Messrs. King and Jack, the two well-known humorous duettists.

The next concert will take place on Friday, April 11th, under the presidency of Mr. Wm. B. Plummer (J. Swain and Son) and Mr. H. J. Goss, Chairman of the Council of the Institute of Printers and Kindred Trades.

Printers' Managers and Overseers ASSOCIATION.

NORTH MIDLANDS CENTRE.

Annual Dinner.

The North Midlands Centre of the above Association held their first annual dinner on Saturday, March 29th, at the Albert Hotel, Nottingham. Members and friends numbering about 100 assembled for the repast and spent a most delightful evening. Amongst those present were the following well-known gentlemen, viz.:—Sir Jesse Boot (Boots, cash chemists), Messrs. James Forman, J.P. (Thos. Forman and Sons, Nottingham), H. Bell (J. and H. Bell), J. Howitt (Howitt and Sons), C. J. Gray (President, Parent Association), E. C. Moyce (General Secretary, P. M. and O. A.), F. B. Lane (President, Birmingham Centre), H. Firth (President, Liverpool Centre), F. J. Hughes (secretary, Manchester Centre), C. Cheesman (secretary, Master Printers' Association), W. Wesson (secretary, Typographical Society), and G. Burton (secretary, Litho Society).

Mr. James Forman, J.P., in proposing the toast of the Printers' Managers and Overseers Association, dwelt upon the responsibility of those in charge of departments, and expressed the gratitude he felt in being invited to join them that evening. Sir Jesse Boot also spoke, and in a very breezy manner thanked those members of the trade, especially the Press, for the valuable assistance rendered him during his business career extending over a period of 50 years.

Mr. E. C. Moyce (secretary, Parent Association) and the President of the North Midlands Centre (Mr. C. G. Budden) briefly responded. Mr. Moyce explained the aims and objects of the Association, pointing out that the Association did not take part in trade disputes, but always held a neutral position, very often being of assistance in finding common ground where disputants may meet to discuss their differences.

The next toast was that of "The Printing Trade," proposed by the vice-president (Mr. A. E. Moore) in his characteristic humorous style, to which Mr. H. Bell and Mr. W. Wesson (secretary, Typographical Society) very ably responded. The "visitors and artists" were not forgotten by Mr. A. J. Savage, in a graceful speech, to which Mr. C. J. Gray and Mr. H. B. Lane cordially responded.

The President of the Parent Association, in a few forceful words, referred to the aims and objects of the P. M. and O. A. and the pleasure it gave him to visit Nottingham since being elected to that honourable position. He particularly asked for the extension of greater facilities to the apprentices, so that they might become more efficient when the time came for them to face the world.

The musical programme included the following artistes:—

Pianoforte Solo ...	Faust ...	Oscar Verne
	Master Jack Allwood.	
Song... ...	When the ebb tide flows	... S. Gordon
	Mr. H. E. Traves.	
Song... ...	...A May Morning ...	... L. Denza
	Madame Bonser.	
Song	'Neath the rolling tide ...	...Jude
	Mr. Jas. Trotter.	
Song (Humorous)	Paper Bag Cookery	H. Fragson
	Mr. Harry Neale.	
Song... ...	... Once Again ...	... Sullivan
	Mr. Herbert Smith.	
Pianoforte Solo ...	... ...	... ...
	Mr. W. F. Moore.	
Song... ...	Come back to Erin	... Claribel
	Master Jack Allwood.	
Song... ...	Asleep in the deep	H. W. Petrie
	Mr. H. E. Traves.	
Song	Mountain Lovers	... Squires
	Mr. Herbert Smith.	
Song... ...	... Good-bye ...	... Tosti
	Madame Bonser.	
Song	My Dreams ...	... Tosti
	Mr. Jas. Trotter.	
Song (Humorous	The Fireman ...	... S. Mayo
	Mr. Harry Neale.	

At the Piano ... ... Mr. W. F. Moore.

That the future prosperity of this Centre is well assured is evidenced by the unbounded enthusiasm shown by the officials and members alike. Although only just celebrating its first anniversary it can look back with pride and pleasure to the past year's work. Lectures and discussions by experts have formed a special feature, whilst the advancement of the budding craftsmen is about to receive serious attention. A pleasing feature of this Centre is the continued interest taken by the district members. There was a full muster of the Lincoln members with their wives, the Leicester and Mansfield contingent also making a good show. Much credit is due to the committee for the admirable manner in which they carried their responsibilities through to so successful an issue.

A New Address Label.

A new regulation affecting the addressing of goods for carriage by rail came into force on Monday last, when the railways of Great Britain adopted the following rule:—

> "Except as otherwise hereinafter provided, goods will only be accepted for conveyance when each article or package: (a) Is fully addressed, or (b) bears a legible distinguishing mark together with the name of the destination station, or (c) bears only a legible distinguishing mark on a label (on the letter-card principle, showing inside the names and addresses of both sender and consignee) which may be opened by the railway company if and when occasion requires."

In order to enable senders to comply with this new condition of carriage, Mr. A. A. James, 32, Thynne-street, West Bromwich, has put on the market a label that fulfils the necessary requirements, in the name of the Patent "Never-Lost" Tally. It is double and, when the address of the sender is written inside, is gummed up like a correspondence card, the address of the consignee being then only visible. Thus only an authorised person can get at the sender's address, if wanted, by tearing off the perforated edges. As an additional precaution the tags bear a registered number, so that in case of getting torn the sender's identity may be easily found by applying to Mr. James. The idea is a good one, and those interested should apply for samples.

Ah Boo Ben Add 'Em.

Ah Boo Ben Add 'Em,
Soaked in a tub of grease,
Slept sound beneath a
Blanket of old fleece;
Then woke to see a
Glimmer in his room.
He plugged his ears—
It was the crack of doom.

He saw a printer
Writing in a book;
It was a volume
Hung up on a hook
Ah Boo stuck out his
Head an inch or two.
"What writest thou?"
Thus questioned bold Ah Boo.

"I write the names of
All subscribers here.
Those that are slow I
Must strike out, I fear."
Then up and spake the
Greasy Ah Boo bold:
"I'll pay you now ten
Years ahead in gold."

The printer vanished,
Bought a snow-white vest,
And stuck Ben Add 'Ems'
Name above the rest.—

In AMERICA

There is published only one weekly paper representative of the interests of employing printers. It is the most popular Printers' Paper read, because:

It is the only strictly Business Paper.
The only Newspaper.
The only Paper which holds the attention of the man who owns the Plant.
The PRINTING TRADE NEWS does not attempt to teach printers to set type, but it is the foremost authority on the latest efficiency methods, the organization activities, progress in cost system work, approved methods of printers' advertising and anything and everything that tends to make the printing business a pleasant and profitable one.

We have good mechanics. Let us have good business men. Let the NEWS come to YOU every week. Europe $5.00 per year; Canada $3.00. 64 Pages weekly.

Photography in Natural Colours.

The Polychromide One-Exposure Method.

The difficulties and disappointments attaching to the production of photographs in natural colours can only be fully appreciated by those who have experimented in that direction, and who have thus acquired to some extent a knowledge of its limitations. When, too, we come to the production of photo-mechanical plates for the printing of coloured pictures, there are many stumbling blocks in the way to success, and it may therefore be of interest to our readers to give a few brief particulars of the attempts that have been made by one enthusiast in colour photography to attain as near to perfection as might be possible, and to make the production of blocks for the three-colour process a matter of ease and certainty. Mr. Aron Hamburger, of the Dover-street Studios, is the gentleman referred to, and after a considerable amount of experimenting, he has succeeded in making his process commercially practical. One of our representatives visited the Dover-street premises the other day, and was courteously shown Mr. Hamburger's methods in so far as they are at present open to inspection.

Briefly it may be said that Mr. Hamburger has constructed a camera which enables him to take by one exposure—and that exposure as short as a hundredth part of a second—a picture possessing all the natural colours of the original, and in the case of portaits, showing every detail of dress, hair, eyes, and even the subtle half-tone in the flesh to an almost incredible degree of perfection. Only one lens is used, and the three negatives, by an ingenious optical arrangement, are taken at one time. The resulting negatives register within an infinitesimal fraction of a millimetre.

For four years past Mr. Hamburger has worked incessantly, in his laboratory attached to the Dover-street Studios, being assisted in those labours by a well-known photographer. So successful, however, are the results of their experiments that the negatives from which reproductions are made are *not* in any way retouched, neither are the prints in any way dyed, stained or tinted. The results are purely photographic, whereas heretofore photography in natural colours has been practically confined to glass transparences. Now, however, natural colour photography for reproduction work is an accomplished fact, and in spite of the great expense which has been necessitated in the production of the apparatus for separating light rays into primary colours to enable them to be again assembled, the cost of the new colour photograph should shortly not greatly exceed that of the ordinary black and white picture.

The interest in Mr. Hamburger's process, in so far as our readers are concerned, lies in its adaptation to the photo-mechanical methods. As the process is essentially a three-colour one, the negatives obtained in the camera may be used without retouching with excellent effects, and give results as to rendition of greys and blacks that are equal to those obtained by many present four-colour methods.

At the Dover-street Studios there are on view many examples of printing done by the Polychromide process. A very fine show-card for Sunlight soap gave a good idea of its possibilities, and we were given to understand that it is being extensively used in the printing office of Messrs. Lever Bros. at Port Sunlight. Some specimens of work done from the plates in America were very fine indeed, and possessed a remarkable softness and fineness of grain that is unusual in this class of work.

There is, indeed, practically no subject to which the system cannot be applied, and Polychromide photographs of jewels, flowers, furniture, carpets, animals, etc., are among the many things to be seen at Dover-street. It is reassuring to be told that the necessary apparatus for the working of the process will not be costly, and that it is now on the market for those who wish to be early in the field with Polychromides.

Treatment of Waste Papers.

An extended course of experiments has been conducted by Mr. J. M. Burby, an American paper mill superintendent, in recovering pulp from waste papers.

Mr. Burby, who has recently been granted a British patent, has found that the proposition to use a dilute solution of alkali is correct but that the mere statement that it may be used hot is not sufficient when paper containing mechanical wood pulp is under treatment. In such cases the proper procedure is as follows:—A solution, made of one, or even less than one, part by weight of caustic soda (NaOH), or of its equivalent of another alkali, in 1,000 parts of water, may be used in the process, this being sufficient to saponify the oily constituents of printing ink, and so to diminish the adhesiveness of the sizing, that the pulp fibres can be readily separated therefrom. Such a weak solution of alkali, or one containing not more than two parts by weight of caustic soda, or its equivalent of other alkali, does not produce the discoloration of the fibres of the mechanical wood pulp, unless it is heated to more than 150 degs. F. A moderately stronger, or more concentrated, solution may be used at the beginning of the process, if a sufficient quantity of it (not less than fifteen times the dry weight of the paper stock) is used, because a part of the alkali is then rapidly consumed in saponifying the oily and adhesive ingredients of the ink. If a solution containing one part by weight of caustic soda (or its equivalent of other alkali), to 1,000 parts of water, and amounting to approximately fifteen times the weight of the waste papers treated, is used, this consumption of the alkali amounts to from 33 to 41 per cent., and will be proportionally greater, if a smaller quantity of the solution is used. It is, however, more advantageous to use a larger quantity of a weaker solution in carrying on the process. A solution of 1·4 parts of caustic potash (KOH), or of 3·57 parts of carbonate of soda ($Na_2CO_3.10H_2O$) or of 1·725 parts of carbonate of potash (K_2CO_3), or of 2·1 parts of bicarbonate of soda ($NaHCO_3$), or of 4·77 parts of borax ($Na_2B_4O_7.10H_2O$) in 1,000 parts of water, are in these respects equivalent to the solution of one part of caustic soda. The carbonates and bicarbonates of soda, or of potash, may be used in somewhat stronger solutions if not excessively heated, and the bicarbonates of soda and of potash will not produce the discoloring of the fibres of the mechanical pulp even if heated above 150 degs. F. If, however, a bicarbonate solution is heated to its boiling point, the bicarbonate is converted into a carbonate and then the effect of the solution upon the fibres of the mechanical wood pulp is the same as if the waste papers had been boiled in a correspondingly strong solution of carbonate of soda, or of potash.

An aqueous solution of borax does not, according to the results of the patentee's tests and experiments, produce the discoloration of the mechanical wood fibres, and does not perceptibly affect their other physical properties, even if more than its equivalent of two parts of caustic soda is used to 1,000 parts of water, or when the waste papers are subjected to its action at high temperatures, or are boiled therein. Consequently, a borax solution may be used for the recovery of pulp from waste papers, in the making of which some particular sizing was used, which cannot well be dissolved unless the papers are boiled or treated in a highly heated solution. This treatment of such waste papers may be undertaken before or after they are pulped; but also when a borax solution is used the most practical method is to pulp the waste papers in it. A solution, containing approximately 2 parts (by weight) of borax in 1,000 parts of water, when thus employed in sufficient quantity—about fifteen times the dry weight of the waste papers to be pulped therein—saponifies the oily and resinous ingredients of the printer's ink as well as the solutions of other alkalies do, and if used heated to such a temperature as required, softens and liquefies also the cohesive ingredients of the sizing sufficiently to enable the fibres of the pulp to be separated therefrom.

The process of recovering pulp from waste papers is best carried on, according to Mr. Burby's invention, as follows:—The waste papers are pulped in a beating engine and then conveyed to chests provided with mechanical agitators. There a quantity of an alkali solution is added thereto, so proportioned in strength, that taking in consideration the quantity of water contained in the beaten stock, which water averages about 29,000 lbs. to each ton of such waste papers, there should not be more than 2 lbs. of caustic soda, or its equivalent of one of the other alkalies, to 1,000 lbs. of water. After the pulped material is thoroughly mixed and agitated in the solution the liquid is drained off, and the pulped material is conveyed upon movable screens, where it is washed with fresh clean water. By this treatment the carbon or other pigments, and other impurities, are separated from the pulp fibres, and removed, all traces of the alkali eliminated, and the clean pulp collected. To avoid the difficulty, if there be any, in determining the proportionate quantity of alkali to be used to produce a solution of only the requisite strength, the alkali may be dissolved in the water delivered into the beating engine, and the waste papers pulped therein; if this course is followed the pulped material need not be treated again in the chests, but the solution should be drained off and the pulped material agitated in fresh water and again drained, before being conveyed upon the screens. The pulp recovered from waste papers thus treated will be found uniformly of the same colour, and in such physical condition as it was when originally used for the manufacture of the grade of paper from which it was recovered, and can be used again, as it was recovered, without any further treatment, in the manufacture of new paper of such a grade. The recovered pulp may be conveyed to the papermaking machine or stored for future use.

A BIG JOB.—The *Printing Trade News* tells of an enormous catalogue that is issued twice a year by Messrs. Sears, Roebuck and Co., of Chicago, Ill., a big mail order house. Within the covers of this book one can find accurately described, pictured and priced almost any article that he needs to eat or wear or use. It represents the solitary selling agent of $65,000,000 worth of goods sold each year. The book is eleven inches high, eight and one-half inches wide and two inches thick. It weighs nearly four pounds, and contains more than 1,300 pages. Five and a half million copies of this catalogue are issued annually. It requiries $500,000 worth of print paper, $150,000 worth of highly calendered paper and $50,000 worth of ink. To make the great catalogue and the special catalogues, as well as to do other printing for the business, an entire four-storey building, 90 by 250 feet is used. Here twenty of the most modern printing presses are in daily use. In the course of one year these presses consume enough white paper 46 inches wide to wrap nearly ten times around the world.

Printers' Pension Corporation.

The Election Results.

As a result of the recent election of candidates for the Pension Fund of the Printers' Pension, Almshouse, and Orphan Asylum Corporation, on March 15th, the following were duly elected, and will receive the respective pensions for the current year, after which they will receive pensions in accordance with their subscription qualifications:—

George E. Briscoe Eyre Pension (£30).—William Hilton.

Sylvia Spottiswoode Pension (£30).—Edward Barsham.

J. R. Haworth Pension (£26).—Henry F. Odell.

Susannah Notting Pension (£26).--Amelia Lockley.

Amalgamated Press (Printing Works) Pension (£26).—Cassio Harris.

Charles Whittinghams (Uncle and Nephew) Memorial Pension (£20).—John Parry.

Charles Edwin Layton Pension (£20).—Henry Conroy.

George Reveirs Pension (£20).—Alfred J. Inwood.

Pardoe-Killingback Pension (£20).—Wm. H. West.

Crespin-Harding Pension (£20).—James M. Macphail.

Drummond Pension (£20).—John W. Vicary.

Passmore-Edwards Pension (£20).—Thos. L. Bower.

City of London Auxiliary Pension, No. 1 (£20).—Daniel C. Brasier.

City of London Printers' Musical Society Pension, No. 2 (£20).—Frederic Couchman.

Scott-Southcott Pension (£20).--John C. Alexander.

Horace Cox Pension, No. 1 (£20).—Charles Penna.

East Ham and Upton Park Auxiliary Pension, No. 2 (£20).—Charles F. Abbott.

Ilford Auxiliary Pension (£20).—Charles Mears.

South London Auxiliary Pension, No. 3 (£20).—Arthur Foley.

Printing and Allied Trades' Charity Sports' Committee Pension (£20).—George Eatly.

Readers' Pension, No. 5 (£20).—Ruth Apps.

Friendly Benefit Society of Machine Managers' Jubilee Pension (£20).—Elizabeth Paradise.

Harrison and Sons' Auxiliary Pension (£20).—Harriet A. Bleach.

Gibbs-Harvey Widows' Pension (£20).—Elizabeth M. Cockett.

King's Printers' Auxiliary Pension (£18).—Annie Brown.

Daily Mail Pension, No. 2 (£18).—George R. Cranwell.

Whitefriars Pension (£18).—William H. A. Stollery.

C. Arthur Pearson Pension (£18).—George Poplett.

Nonpareil Auxiliary Pension, No. 4 (£17).—Robert Holmes

Camden Town Auxiliary Pension, No. 1 (£17).—William Cunningham.

Electrotypers' and Stereotypers' Pension, No. 1 (£16).—John Day.

Electrotypers' and Stereotypers' Pension, No. 2 (£16).—Henry Guy.

Andrew Carnegie Pension (£15).—Emily Marriott.

John Maxwell Memorial Pension, No. 2 (£15).—James Chick.

Lownds Pension (£15).—Herbert J. Malcom.

Athenæum Pension (£15).—Alice Wicks.

Daily Mail Pension, No. 1 (£15).—William H. Hosmer.

Caslon Pension (£15).—Edward Lloyd.

Printers' Managers and Overseers Association Pension (£15).—Thomas C. Leverett.

George McCorquodale Memorial (London) Pension (£14).—George Banks.

Henry William Hutchings Pension (£14).—George S. Thornton.

Herbert Lloyd Pension, No. 2 (£10).—Martha L. Simmonds.

Mulley Pension, No. 4 (£10).—Martha S. Golding.

North-East London and East Ham Auxiliaries Pension (£10).—Caroline North.

Stephenson Pension (£10).—Frances M. King.

Stoke Newington Auxiliary Pension (£10).—Amelia M. Courtney.

John Maxwell Memorial Pension, No. 3 (£10).—Sarah Napper.

North-East London Auxiliary Pension (£10).—Ellen Houghton.

Readers' Pension, No. 2 (£10).—Esther J. Phillips.

Petter Pension, No. 1 (£8).—Eliza Britt.

Longest Unsuccessful Candidates' Committee Pension (£20).—William G. Scarlett.

Walter Haddon Longest Unsuccessful Candidates' Pension (£20).—Frank H. Hight.

The unsuccessful candidates were as follows:—

South London Auxiliary Gift, £5 each:—Mary J. Rust, William Murphy, George Carter, Henry J. Wardley, William J. P. Holland.

City of London Printers' Musical Society Gift, £5 each:—Albina Mitchell, Walter J. Scottow, Alfred J. Clarke, Elizabeth Stevens, George Whitby.

Ilford Auxiliary Gift (£5).—Charles West.

Camden Town Auxiliary Gift (£5).—William Stewart.

Longest Unsuccessful Candidates' Committee Gift (£5).—Thomas H. Winter.

The scrutineers were Messrs. W. H. De Wilde, C. S. Elliott, and R. R. Gibbs.

Printers' Managers and Overseers ASSOCIATION.

YORKSHIRE CENTRE.

Annual Dinner.

The sixth annual dinner of the above Centre was held at the Golden Lion Hotel, Leeds, and was very well attended. Amongst those present we noticed Professor Sadler (Vice-Chancellor, Leeds University), C. Stephenson, A.R.C.A. (Principal, Bradford School of Art), Mr. R. E. Barnett (Head Master, Central Technical School, Leeds) and Mrs. Barnett, Mr. and Mrs. Ellis, Mr. and Mrs. Wilkinson, Mr. and Mrs. W. H. Crowther, and others, about 60 sitting down.

In the absence of the President, the chair was taken by Mr. R. Benson (vice-president), who extended a hearty greeting to the company present. After the menu had been done full justice to, and Mr. R. Benson having proposed the toast of "The King,"

Professor M. E. Sadler proposed the toast of the evening, "The Printers' Managers and Overseers Association." He said that those who had had the arrangement of that evening's programme had entrusted to him the great honour of proposing the toast of the Printers' Managers and Overseers Association, and he did so with very great pleasure. He knew just enough about printing to realise that he knew nothing at all about it. Almost the first really great gift that his father had given his sister and himself when they were little children was a case of real type. He did not know at the time that it was a form of education, but it was placed in the lumber-room of their home at Barnsley, and some of the best and happiest hours of their lives were spent in composing month by month the issue of the *Barnsley Gazette*, a quarter of the space of which was devoted to a gossipy fashionable gazette. If he were to set type at the present time he did not suppose he would earn twopence per week, but all through his life from childhood he had been consistently connected with type. For a great number of years he had been engaged in literary and newspaper work, and he could remember the time when he became editor of two magazines at school. At the present day many times a week he had direct communication as between customer and printer.

He would like, on behalf of many who would be in a similar position to himself that evening, to express what one did not often get the chance of expressing, the thanks and gratitude of those who relied on their craftmanship for the care, skill and thought which were often devoted to their work. They could not exist without such help, and they were not insensible of the amount of human interest, skill, and self-sacrifice which was given to the work, for which they were heartily thankful and glad to be able to give their personal thanks. He imagined that the missives which sometimes reached printing offices were occasionally trying and not always complimentary. There was the man who declined to have any type but one that they had not got; he must be a cause of harrassment to their declining years. The gentleman who spells different to everybody else was going to be a very complicated phenomenon. New letters representing certain kinds of phonetic sounds were introduced, and the future life of the printers' manager and overseer would be far from a happy one.

He hoped that the Association of which they were members would flourish root and branch. Printing was half-sister to the arts, and it was drawing nearer and nearer year by year into its companionship. He did not forget how difficult it was in the commercial world to live up to one's ideals, but for all that we might encourage ourselves with the hope that the commercial demand will improve in artistic quality. We were just now beginning to realise the effects of great changes in our elementary education, and those countries which have had an ample supply of modern elementary education the longest were exactly the countries in which at the present time the popular demand for good artistic printing was the strongest. Exactly the same change had come over third class railway carriages within our memory; the accommodation which had risen from cattle trucks to the present luxurious coaches was taking place in the standard of expectation of quality and form in our daily life.

He desired to associate with the toast the names of Mr. W. H. Davey, vice-president of the Birmingham Centre, and would say in conclusion that in the West Riding of Yorkshire they had a spirit of co-operation in educational work which he had not seen surpassed in any part of the world. (Applause.)

Mr. Davey (Vice-president, Birmingham Centre), in his reply, said it afforded him very great pleasure indeed to respond to the toast which had been proposed in such a scholarly manner by Professor Sadler. He was very glad indeed to hear him mention the very great improvement that technical education was now making, in the education of young people. His own firm, Messrs. Cadbury Brothers, of Bournville, were first and foremost with the idea that in teaching young people their trades they must also teach them the technical side of it. At their works at Bournville they had works schools not only for printers but for carpenters, engineers, and also for practically every trade that was represented amongst their 7,000 employees. Everyone entering the works before being finally apprenticed had to go through the course of technical education and also through the particular course of lectures given by experts. To make a man a better workman was the only way to cope with the extreme competition we now meet with from other nations. At the annual dinner of the Parent Association, the president, in the course of his address, laid great stress upon the point that technical teachers should be quite up-to-date in their methods of teaching. Undoubtedly they were advancing rapidly here in Leeds, and he was glad of the opportunity of meeting Mr. Stephenson and Mr. Barnett, who were showing their sympathy and advancing the interests of the printing trade. In conclusion, he would like to express the sympathy of the Birmingham Centre with the members of the Yorkshire Centre in the long-continued absence of their President, and he would like the Chairman and Secretary to tender to him their very deep sympathy, and wish him a speedy and permanent recovery.

The toast of the "Ladies, Visitors, and Artistes" was very ably proposed by Mr. H. Dixon, and responded to by Mr. R. A. Barnett.

During the evening an excellent programme of music was carried through. Mrs. Alf Vincent, Mrs. L. C. Mennill, and Mrs. D. E. Ramsden gave songs, which were much appreciated, Mrs. Alf Vincent being encored after each number. Mr. Wilson Moore sang some very fine baritone songs, his rich voice being heard to advantage in "Drake Goes West" and "Son of Mine." Mr. Percy Pope was a pleasing tenor, whilst the humorous songs of Mr. Tom Driffield and recitals of Mr. Harold Pullan kept the audience in a good humour until the singing of "God Save the King" brought an enjoyable evening to a close.

Mr. Clifton Bingham, the well-known song writer, died last week at Bristol of apoplexy. Mr. Bingham was a son of a Bristol bookseller. He began journalism at Cheltenham. Removing to London, he engaged in musical and dramatic criticism, and wrote, besides stories, poems and Christmas card verses, some 1,600 songs.

Trade Notes.

THE death has taken place of Mr. Joseph H. Wallace, a well-known Newcastle journalist, after a prolonged and painful illness, in his 69th year.

LORD ROSEBERY has accepted an invitation to be the guest of the Press Club, at the annual dinner on April 12th, at De Keyser's Royal Hotel.

Mr. W. G. SCOTCHER, son of Mr. W. Scotcher, who is well known in the printing world, has recently obtained an official appointment on the Central Argentine Railway.

IT is announced that the publishing firm of Messrs. Greening and Co., Ltd., is being amalgamated with that of Mr. Stanley Paul, who will, however, conduct the firm of Greening and Co. under its old name.

PRESIDENT WILSON has appointed Mr. Walter H. Page, proprietor of the *World's Work*, to be United States Ambassador at the Court of St. James's. Mr. Page was formerly editor of the *Forum* and the *Atlantic Monthly*. He was born in 1855, and has been engaged in literary pursuits all his life.

THE Publications Committee of the House of Commons last week held an inquiry as to the possibility of reducing the cost of certain Blue-books, the issue of which is pending, and it was stated by Sir Rowland Bailey, Controller of the Stationery Office, that the work of the committee, in restricting the publication of unnecessary matter in official documents, had resulted in a saving of £150,000 a year.

THE death has occurred at Aberdeen of Mr. John Bulloch, the editor of *Scottish Notes and Queries*; the biographer of George Jamesone, the Scottish painter; an erudite Shakespearean scholar, and the author of many papers on antiquarian subjects, as well as an extended work entitled "Historic Scenes in Aberdeenshire." One of Mr. Bulloch's sons is Mr. John Malcolm Bulloch, editor of the *Graphic*.

ON Saturday evening, at the Manchester Press Club, Mr. J. H. Harley, of London, ex-president of the National Union of Journalists, gave an address on the new Australian scheme, which provides for a minimum wage for journalists in the Dominion. After describing the Australian system in detail, Mr. Harley said that while it did not lay down any general set of conditions that could be adapted to this country, it was extremely interesting as an attempt to introduce some sort of order into the great medley of journalism and journalistic conditions.

INSTITUTE OF PRINTERS.—In the form of a very nicely got-up pamphlet, the Institute of Printers and Kindred Trades of the British Empire has issued a prospectus containing information regarding the objects of the Institute, its work, the functions that take place from time to time, and the privileges of membership, together with a comprehensive list of those who are eligible for membership. There are also some particulars of the Benevolent Fund. A portrait appears of the President this year, Sir George Riddell (*News of the World*), who will preside at the thirteenth annual dinner of the Institute, at the Connaught Rooms, Great Queen-street, Kingsway, on Tuesday next.

MESSRS. LINOTYPE AND MACHINERY, LTD., have an interesting stand at the National Trades and Industrial Exhibition, at the Bingley Hall, Birmingham, which is now open. Their exhibit comprises an L & M Offset Litho Rotary (it will be remembered that this is a two-revolution press), a No. 4 Miehle, two Linotype machines (a Model 4 and a Model 10), and some rollers cast on the Gatling gun principle by Rowe roller-making machinery. Samples of the well-known brands of metal supplied by the firm are also shown (and, in the case of the Linotypes, used). Our readers in the Birmingham district should make a point of seeing this exhibit.

TENDERS WANTED.—For supply of account books and stationery for the Corporation of London for three years from July 1st. Tenders to the Hallkeeper's Office, Guildhall, E.C. For supplying books, stationery, etc., for the Denbighshire County Council. Forms of tender from Mr. W. R. Evans, County Offices, Ruthin. For the printing of the year-book, for the Guardians of Sculcoates Union, Hull. Particulars from Mr. J. H. Wild, Union Offices, Harley-street, Hull. For a supply of printing and stationery for the year ending March 31st, 1914, for the Trowbridge Urban District Council. Particulars from Mr. H. G. Nicholson-Lailey, Town Hall, Trowbridge. For the supply of stationery for the Rugby Urban District Council. Particulars from Mr. J. H. Sharp, Benn Buildings, Rugby.

THE annual staff dinner of Messrs. Cassell and Co., Ltd., was held at the Trocadero Restaurant, under the presidency of Mr. Arthur Spurgeon. A feature of the evening was the entertainment which was provided by the staff, and included the La Belle Sauvage Glee Singers.

THE April issue of the *Royal Magazine* appears in an attractive cover from a design by A. Gilbert, and the contents are of an interesting character. The fiction is good, and includes stories by clever authors, while the other matter is well selected. Finely illustrated, as usual, the number should be much appreciated.

TENDERS ACCEPTED.—By the Stepney Board of Guardians: for printing, Messrs. Furley; for stationery, Messrs. Haddon Best. By Deal Town Council for printing: Messrs. T. F. Pain and Sons, Deal. By the Ealing Town Council: for stationery, Messrs. Shaw and Son; for printing, *Middlesex County Times*. For a supply of Printing to the Kensington Board of Guardians the tender of Messrs. G. Pulman and Sons is recommended for acceptance. The Barking Town Urban District Council have recommended for acceptance the following tenders: for printing and books, Messrs. Baigents, Ltd.; for stationery, Messrs. Truscott and Son, Ltd.

MR. R. W. JOHNSON (chairman), presided over the annual meeting of the North-Eastern District of the Journalists Institute, which was held on Saturday night last, at the Crown Hotel, Newcastle-on-Tyne. Mr. T. Greene (hon. sec.) presented the annual report, which stated that during the past year, which had been a very successful one, there had been a substantial increase in membership—present total 81. With regard to the earlier closing at North and South Shields Post Offices, the result of negotiations had been the restoration of the old custom. The hon. treasurer (Mr. P. J. Dorrian) in his report, gave the turnover for the year as £106 18s. 2d., a record for the district, the balance in hand being £27 4s. The following were elected officers for the ensuing year:—Chairman, Mr. A. E. Johnstone; vice-chairman, Mr. R. W. Johnson and Mr. C. Taylor; hon. sec., Mr. T. Greene; hon. treasurer, Mr. P. J. Dorrian.

Scottish Master Printers.

A Cost Congress in Edinburgh.

Under the auspices of the Scottish Alliance of Master Printers a cost congress was opened in the Freemason's Hall, Edinburgh, on Monday, under the presidency of Mr. W. B. Blaikie (T. and A. Constable), who, in the course of his address, said that the time had come when it was necessary for them to look into their expenses and adjust their work. Without any doubt the expense of running a printing office had increased no less than 15 per cent., and there was no sign of any rise in prices. They had gone on pursuing a career of self-sweating. No doubt the cause of self-sweating was the very legitimate desire to see their turnover as large as possible. That was achieved sometimes at the cost of injury to their fellows—an injury which reacted upon themselves. One reason for so much self-sweating was that few of them had any intelligent or scientific knowledge of what the cost of their business really was.

Mr. R. A. Austen Leigh (Spottiswoode and Co., London) gave an address on "What is Wrong with the Printing Trade? The Crying Need of a Cost System." He said that the present movement would produce great results in the printing trade. Those engaged in the trade felt that, considering the very great amount of brains, energy, and capital put into the trade, the resulting profits were far less than they had a right to expect. What was wrong with the trade was summed up in two points—(1) Ignorance of what it cost them to produce printed matter, and an insane and ever-growing spirit of competition; and (2) the need of knowledge of cost and greater co-operation among printers. He explained the value of a proper costing system.

Mr. W. Howard Hazell, London, gave an exposition of how to ascertain costs, and an explanation of the system formulated by the Special Costing Committee of the Federation.

Other speakers followed, and the conference was adjourned.

The annual dinner of the Scottish Alliance was held in the evening. It was a fine function. It differed from English usage in various ways. For a start, King George was toasted as the hundred and twenty-first King of Scotland. An interesting and very acceptable personal announcement was left to the end, when the health of Mr. Walter Blaikie, the retiring president, was honoured. Mr. McLehose, of Glasgow, submitted the toast with the greatest warmth, speaking as an intimate friend of twenty-five years standing. He told the company that the University of Edinburgh was conferring on their honoured president the degree of Doctor of Laws, and accordingly he asked them to drink to the health of Dr. Blaikie. The cheers were loud and long.

Mr. Blaikie, writes our correspondent, "is a man of rare culture, to which he adds in most exceptional degree that indefinable thing called charm. He had just delivered one of the finest speeches it has been my lot to hear from any man. I count it a privilege also to tender sincerest congratulations to this prophet who *is* honoured among his own people."

L.C.C.

Central School of Arts and Crafts.

Exhibition of Lithography.

Many interesting little exhibitions have been held in the handsome building of the London County Council Central School of Arts and Crafts in Southampton-row, W.C. (with which is incorporated the Royal Female School of Art), and the latest, an exhibition of lithography, is one of the most interesting. While presenting the actual work of the present day student—and very promising work much of it is—there is also a delightful little exhibit of the historical side of the art. There is thus a happy conjunction of practical instruction with ideal encouragement.

The Exhibition consists principally of original lithographs and studies, the work of classes in lithographic drawing carried on in institutions maintained and aided by the Council, viz., the Camberwell School of Arts and Crafts, the Camden School of Art, the Central School of Arts and Crafts, the School of Photo-Engraving and Lithography and the South-Western Polytechnic, together with some examples illustrative of the early history of the art kindly lent by the Authorities of the Victoria and Albert Museum and the Governors of St. Bride Foundation. In addition to this, there is a small collection of lithographs contributed by the Senefelder Club, an association of the principal artists practising lithography in this country, while through the courtesy of the publisher, M. Edmond Sagot, of 39bis, Rue de Chateaudun, Paris, there is shown a number of examples by distinguished French artists, including Eugene Carriere, Priers de Chavannes, Cheret, Grasset, Steinlen and Toulouse-Lautrec. Examples of commercial poster work and school pictures, English and foreign, are also shown. Demonstrations are given at intervals of the processes of lithographic drawing and printing, and occasional lectures will probably be also given.

The Exhibition, admission to which is free, will remain open during the whole of April, Saturdays excepted, between the hours of 12 noon and 9 p.m. daily.

A Printers' Dispute.

Messrs. A. Megson and Sons, Ltd., printers and stationers, of Lower Cambridge-street, Manchester, were summoned at the City Police Court by twelve of their employees, who were members of the Manchester Typographical Society, for 18s. 3d.—two-and-a-half days' wages—and £4 in lieu of two weeks' notice. In his opening, the complainants' counsel said that one case would decide the whole. The trouble arose through the objection of the employees to work as the result of the importation of what they described as non-union labour. In December last there was a bookbinders' strike, and Messrs. Megson had no one to cut paper for their employees. The Bookbinders' Society gave permission for an employee to cut paper for a week, but at the end of that time the employee said he was unable to go on cutting paper. A youth was then sent by Mr. Megson to do these duties, and the Bookbinders' Society communicated with Mr. Hunt, the secretary of the Typographical Society. A meeting of Messrs. Megson's compositors was held, and a resolution protesting against imported labour was passed. Mr. Megson then wrote the following notice:—

> Dec. 31, 1912, 5.58 p.m.
>
> We hereby dismiss at this moment all the employees in the letterpress and machine passing room owing to their breach of contract in refusing to continue work.
>
> A. MEGSON AND SONS, LTD.

As a point of fact, continued complainant's counsel, the machines were still running and work was in progress.

Digitized by Google

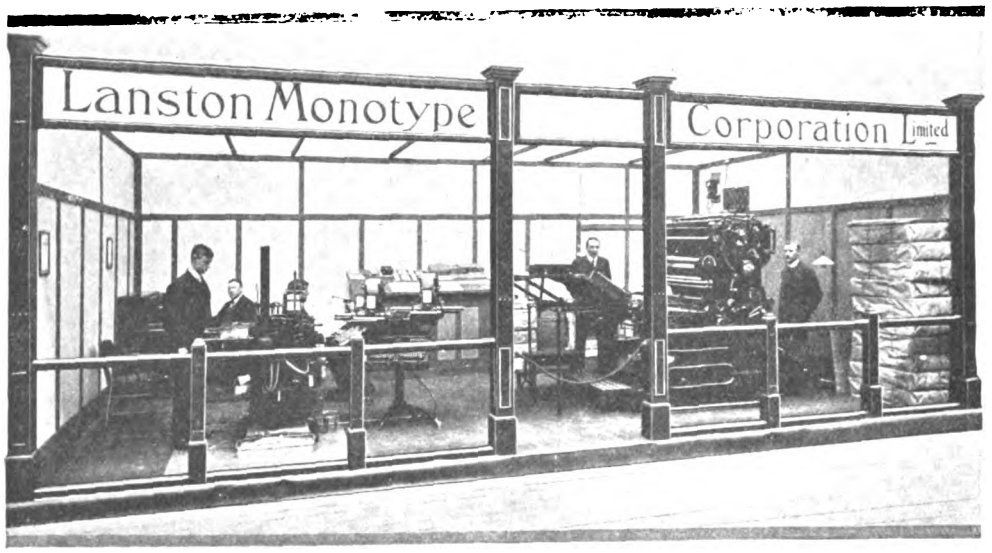
Paul Cairis, one of the claimants, said he was not aware that all the big firms in Manchester employed non-union labour for cutting.

Counsel for the defence said Mr. Megson found his printers holding a meeting during working hours, which was contrary to rules. After the meeting was over Mr. Megson had a conversation with Cairis and another man, and it was on this conversation that the whole dispute turned. Defendant's version was that the men said they could not continue to work because the paper had been cut by a non-unionist. He gave them the opportunity of getting a union cutter, but they declined, whereupon Mr. Megson said that if they did not go on with their work they must be dismissed. Counsel added that he was raising a counter-claim for £5 against each of the men.

The Stipendiary (Mr. E. Brierley) said he could not admit the counter-claim.

Counsel, continuing, said the loss sustained by Messrs. Megson and Sons by the dispute was £73 11s. Workpeople had to be imported from London and work given to other firms.

Mr. Brierley said he thought the whole question was whether the men declined to work or not. After evidence had been given for the defence, Mr. Brierley found for the plaintiffs on the amount claimed.



A Monotype Exhibit.

The Monotype composing machine is being shown working at Bingley Hall, Birmingham (where an exhibition is being held under the auspices of the National Trades Exhibition, Ltd.), and will be on show there until May 31st next. The exhibition consists of a Monotype "DD" keyboard, a Monotype caster, and a Monotype "D" keyboard. The Monotype caster is equipped with a display type attachment, and casts type from 18 point to 36 point. There is also in operation a Harris double crown Automatic Offset Lithographic Press.

The Lanston Monotype Corporation, Ltd., has a very dignified-looking stand in oak colour, with grey panels, and cream friezes, the floor being covered with a harmonious shade of green linoleum. The stand, which is on the unit basis, was designed in their own publicity department.

Many printers in the Midlands may not be familiar with the "DD" keyboard above referred to, but there is a claim (borne out by facts in our possession) that on certain classes of work the "DD" keyboard can show a saving of 50 per cent. A Midland printer with two "D" boards and one "DD" board did a special job on the latter. The time-saving merits of the board so impressed him that, reluctant as he was to increase his expediture for the year, he felt bound to have the two "D" boards converted to "DD's."

The Lanston Monotype Corporation, Ltd. (who are distributing a large number of tickets for the Exhibition), will be pleased to send tickets to any printer who may apply for them. Mechanical excellence has reached a high pitch with the Monotype, and those printers who are not yet ready to instal should at least become acquainted with the merits of the Monotype composing machine.

The Monotype Stand at the Birmingham Exhibition.

MR. FREDERICK KILBOURN, for 45 years in the service of the *Times*, has left estate of the value of £403.

Newspaper Competitions.

At the annual meeting of the Lancashire Newspaper Society, held at Manchester, the subject of competitions for prizes, offered by newspapers, was discussed, and the following resolution was passed unanimously :—

"That this meeting of the Lancashire Newspaper Society, held at Manchester on March 31st, 1913, views with alarm, and enters its emphatic protest against the practice of certain weekly periodicals and newspapers in offering large sums of money as prizes in word-solution competitions (for which an entrance fee is charged), and free football forecasts, on the following grounds :—

"(1) That it is not fair or desirable trading competition.

"(2) That it detracts from the dignity for which English journalism has so long been pre-eminent.

"(3) That it is detrimental to public morals that such large sums of money as £5 per week for life, £3 per week for life, and £1,000 and £500 cash prizes should be awarded for efforts in no degree commensurate with the labour involved or the intellect demanded.

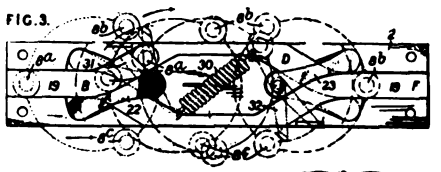
"(4) That it creates among a large section of the public a spirit of 'get-rich-quickly-by-any-means' that is neither good for the individual nor the nation.

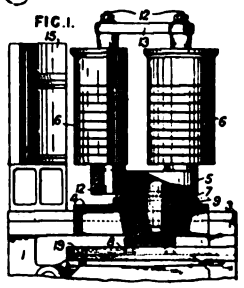
"(5) That a copy of this resolution be forwarded to the Prime Minister and the Home Secretary, with a request that His Majesty's Government will bring in a Bill in the present session of Parliament prohibiting these competitions, or at least moderating the amount of prize-money offered."

Curved Stereo Plates.

An invention patented by the Vogtlandische Maschinenfabrik (J. C. and H. Deitrich) Akt. Ges., relates to machines for casting and finishing curved stereotype plates of the kind described in Specification 14,780, 1908, and consists in means for rotating the reciprocating table, which in this case carries three cylinder cores, through one hundred and twenty degrees on each reciprocation. The turntable 5 which carries the three cores 6 is mounted on ball-bearings 7, 9 on the carriage 4, which reciprocates in a path 3 in the frame 1. The shafts 12 are rigidly mounted in the turntable 5 and braced at the top by a yoke 13. On the underside of

FIG. 3.





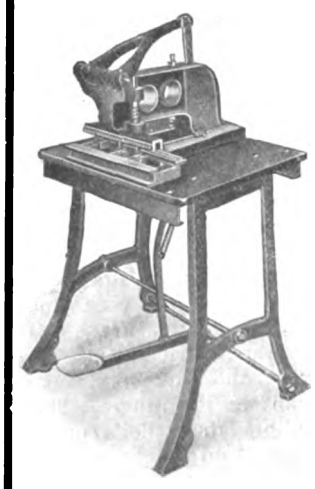


FIG. 1.

the turntable are three rollers 8 corresponding to the cores 6. which are adapted to run in a cam groove 19 to turn the table 5 step by step. Starting from the position shown in Fig. 3, the roller 8^a travels down the groove 19 to the point B where it is diverted by a switch 22 held over by a spring 30. At the same time the roller 8^b turns into the inclined part D of the groove and forces over a switch 23 also held over by the spring 30. The core corresponding to the roller 8^a is thus carried with the newly-cast plate past the milling mechanism, and the core of the roller 8^b is carried into position to deposit its plate into the shaving device at the position F. On the return motion the turntable is further turned to place the core of the roller 1^c in the casting shell 15. Arms 31, 32, with upturned ends for engaging the frame 2, are provided on the switches 22, 23 for limiting the action of the spring 30.

CORPORATION OF LONDON.

SUPPLY OF ACCOUNT BOOKS, BOOK-BINDING, GENERAL STATIONERY, SCHOOL STATIONERY, DRAWING OFFICE MATERIALS.

TENDERS are invited by the General Purposes Committee of the Corporation of London for the supply of ACCOUNT BOOKS and STATIONERY to the several offices of the Corporation for a period of three years from the 1st July next. The Conditions of Contract, Form of Tender, and Schedules may be obtained on application at the office of the Printing and Stationery Clerk, Guildhall, E.C., on and after Thursday, 27th March, 1913.

Samples and patterns may be inspected in the above-mentioned office from the 27th March, 1913, to 30th April, 1913.

Tenders must be enclosed in a sealed envelope and endorsed "Tender for Stationery," and delivered at the Hallkeeper's Office, Guildhall, E.C., by 12 noon on the 5th May, 1913.

The Committee do not bind themselves to accept the lowest or any tender, and reserve to themselves the right to accept the whole or any part of a tender.

Pushing Foreign Trade.

AMERICAN manufacturers are making great efforts to obtain the orders for machinery, plant and materials that are required in South America and in various foreign countries, and are securing such a large share of this trade that in many cases British firms have little or no chance in the competition; and to a great extent this is the fault of the British manufacturer who, as a rule, is not quite up to the smart American business standard. The American is quite alert to the uselessness of sending catalogues printed in English to countries where that language is not spoken, and so has his printed matter got up in the language of the country in which he is trying to do business. His enterprise is not confined to a cheap circular or two, but elaborately got-up booklets, illustrated with photographic reproductions of his wares, in many cases printed in colours, with the explanatory matter in the language of the country appealed to, are sent out broadcast wherever there is even a remote chance of securing an order, and the result is that a considerable amount of business that ought to have come to the Britisher is lost to him. Now the American manufacturers are sending their catalogues to the American consulates in foreign countries, and those desirous of consulting them can see them there. These catalogue files allow the seller's printed description and illustration of his product, his prices and terms to be directly available to the foreign buyer. They serve as a quick and effective means of reaching the merchant abroad while the idea of buying American goods is uppermost in his mind, and thus help to promote sales. At the Bombay Consulate alone there are the catalogue files of over 750 American manufacturers, and these are being added to, while in South America the Consul's offices at the various places where trade can be done are assisting to push trade in a similar manner. In the face of these facts it is time that British manufacturers made an effort of some kind to recover the ground they have lost, and at least to push their goods with the energy displayed by their American competitors.

* * *

A Printer's Blunder.

QUITE an amount of mild excitement has been caused in educational circles by a printers' mistake that occurred in the higher French paper of the leaving certificate examination throughout Scottish schools, which was discovered on Friday. When the sealed papers were opened and distributed to the candidates, it was found that through some extraordinary blunder only one of the three pages of the document contained questions in French, the others being a reprint of the examination in English held on Wednesday last. In the Glasgow schools the candidates were instructed to answer the questions on the first page of the paper *only*, and it is believed that in most of the Scottish schools *also* this was done. The Scotch Education Department have since issued the following notice:—"With reference to the second paper in higher French, the Department regret that, owing to a serious mistake on the part of the printers, the examination in that paper has had to be cancelled. You are therefore requested to return all the books of answers to that paper and the defective examination papers. These parcels should be marked 'French Special.' Further instructions will be issued at the earliest possible date." In accordance with that advice the supervisors of the examinations have forwarded the books of answers to the Department. Meanwhile further communication from headquarters is anxiously awaited by candidates and teachers.

* * *

Printers' Mistakes.

APROPOS of the article in a recent issue on errors that occur in printing offices, we quote from the *Manchester Guardian* of a recent date as follows:—"A London newspaper brought out the result of the Boat Race with great swiftness, but unluckily printed it as 'Cambridge won.' . . . It was in Fleet-street itself that the machines were set running at frantic haste one day in the eighties because a sub-editor found on a tape machine the words 'Queen Victoria died at Windsor Castle this morning.' Luckily for him he made inquiries before the papers got into the streets, and found that the first part of the message, which read 'Coachman to Queen Victoria," had been torn off. The Maybrick case provided a notable example of the slips that may attend a well-laid scheme. A newspaper arranged for the verdict to be signalled from point to point to its office by the waving of handkerchiefs—red for guilty and white for not guilty. One of the signallers carefully put the red handkerchief at the bottom of his pocket. When he got the red signal he whipped out first the white handkerchief, and in no time the next signaller had accepted that as the signal and had passed on to the newspaper office the wrong verdict. In Birmingham once, before the swift 'fudge-box' of to-day had been so wonderfully developed, a sub-editor hit upon what he thought to be a perfect plan for beating his rivals, if only by a couple of minutes. He did not know much about horse-racing, and he had wonderful faith in tipsters. So on the morning of the Derby he prepared a series of results. He took all the horses that had been tipped for 'one-two-three' and had type set up for each name. When the result came it had only to be shouted to the machine-room, the right combination of type chosen, and the machines let go. To-day the plan sounds ridiculous enough, but it seemed sound then, and might have proved so if only the horses had been reasonable. As it happened a rank outsider won. Not a single tipster had named him.

Digitized by Google

There was no combination of type ready, and the other paper scored." These are but examples of the mistakes that pressmen may fall into, and in the worry and rush of getting out newspapers the wonder is that they are so few.

* * *

Paper Mills in British India.

According to a return received from the Director-General of Commercial Intelligence at Calcutta, published in the *Board of Trade Journal*, the number of paper mills in India in 1911 was nine, comprising three in Bengal, four in the Bombay Presidency, one in the United Provinces, and one in the Gwalior State. The estimated capital of these mills was about 54 lakhs of rupees. The value of the output reported fell slightly from 81.5 lakhs in 1910—the largest value in any single year on record—to 80 lakhs in 1911. The competition of cheap wood pulp paper imported from Europe has checked the development of papermaking by older methods in India; the most successful mills are those which have Government contracts for the supply of cheap foolscap, blotting paper, note-paper, and envelopes. In 1907 the value of the paper manufactured in India and of that imported was 73 lakhs and 94 lakhs respectively. In 1911 the corresponding figures were 80 and 109.5 lakhs, the value of the imports having increased in the meantime by 16 per cent., and the value of the internal production by only 10 per cent.

The late Mrs. Ellen Mary Davy, novelist, has left estate of the value of £36,393.

At the forthcoming Grocery Exhibition, to be held at the Royal Agricultural Hall, Islington, from September 20th to 27th next, there is to be a poster competition, in which the following prizes are offered:—1st prize, gold medal and diploma; 2nd prize, silver medal and diploma; 3rd prize, bronze medal and diploma. Designs suitable for use by retail grocers and provision dealers must be sent addressed H. S. Rogers, "Poster Competition," Royal Agricultural Hall, Islington, N., either on September 15th or 16th. Entries for the competition close on August 23rd. Space for the display of the posters sent in will be provided free of cost, and an entry fee of one guinea for each design sent in is charged. The object of this competition is to bring before the wholesalers, retailers and owners of proprietary articles, designs for posters suitable for their use and incidentally to encourage grocers and provision dealers to use posters in advertising their business.

Financial.

Offices of the *British and Colonial Printer and Stationer*,
58, Shoe Lane, London, E.C.
Wednesday, April 2nd, 1913.

TOWARDS the end of last week easier conditions manifested themselves in the money market. There has been some large displacements of cash in Lombard-street, and with a plentiful supply of credit loan rates are easy. Yesterday a large sum falling due to the Bank of England was easily repaid. The discount market remains easy. Bullion movements have been few and small, and the purchases of bar gold have resulted in a net influx for the week of £240,000 to date. In stock markets the optimism of last week has given way to depression, a less hopeful view being taken of the situation in East Europe. Consols have gained ground, but were a little unsteady yesterday. The quotations now are 74¼ to 74⅜ for money, and 74½ to 74⅝ for the account.

The miscellaneous industrial market has been extremely quiet this week, though there is a fairly steady tone. In the section relating to paper and print there have been small movements both ways. Amalgamated Press Ord. are up ¼ to 6¾—7; Ilford Ord. have risen 1/16 to ⅝—¾; Eyre and Spottiswoode Deb. are down 2 to 82—85xd.; and Waterlow and Sons Pref. Ord. have dropped ¼ to 11¼—12¼xd., and the Cum. Pref. ⅛ to 7⅜—8⅜xd. Business has been done during the past seven days in Amalgamated Press Pref. at acc. 21s. 6d. and 21s. 3d.; in Associated Newspapers Pref. at acc. 20s., 21s. 6d., 21s. 3d. and 21s. 6d.; in Cassell and Co. at acc. 5; *Financial News* Pref. at 14s. 6d.; in Ilford Ord. at acc. 12s. 9d., 14s. and 14s. 3d.; in International Linotype at 80; in Linotype and Machinery B Deb. at 45; in George Newnes Pref. at 14s. 6d.; in C. Arthur Pearson Pref. at 67s. 6d.; in Spicer Bros. Pref. at acc. 9 7/16, 9½ and 9⅜; in *Standard* Newspapers Pref. at 53s. 9d.; in Raphael Tuck and Sons Ord. at 17s. 6d. and 17s.; in Waterlow Brothers and Layton Ord. at 5¾; in Weldons Pref. at acc. 20s. 3d.; and in Wyman and Sons Pref. at 15s.

DIVIDENDS AND REPORTS.

Raithby, Lawrence and Co., Ltd.—The annual general meeting of the shareholders of this company was held at Leicester, the chair being occupied by Sir Samuel Faire, chairman of the company. The directors' report, balance-sheet and accounts, with the auditors' certificate and report for the year 1912 having been submitted to the meeting and adopted, a dividend for the past year at the rate of 5 per cent. per annum on the preference, ordinary and deferred shares was declared, free of income-tax.

Alexander Thom and Co., Printers, Dublin.—The report states that the profits for the year amount to £11,225, being an increase of £570 over the previous year. The directors clear off a debit balance of £1,718, write down investments by £150, and recommend a dividend of 5½ per cent. per annum for the six months ended July, 1907, on the preference shares, £1,897, carrying forward £1,469.

William Collins, Sons and Co., Ltd.—The directors of William Collins, Sons and Co., Ltd., recommend a dividend of 2½ per cent. on the ordinary shares, making 12½ per cent. for the year; placing £2,000 to reserve, making £41,000; and carrying £2,266 forward.

Mansell, Hunt, Catty and Co., Ltd.—The directors of Mansell, Hunt, Catty and Co., Ltd., have declared a dividend of 14 per cent., less income tax, on the ordinary shares for the past half-year, making 18 per cent. for the year; placing £1,500 to reserve, and carrying £1,352 forward.

International Linotype, Ltd.—The directors of the International Linotype, Ltd., recommend a final dividend of 5½ per cent. (£5 10s. per £100 stock) for the year ended 31st ult., making, with the interim dividend, 8 per cent. for the year, being at the same rate as for the preceding year.

L. Upcott Gill and Son, Ltd.—The report of L. Upcott Gill and Son, Ltd., for the period from February 14th to December 31st, 1912, submitted to the meeting yesterday, states that the company was not incorporated until February 14th, 1912, but the business was taken over as from November 1st, 1911. The terms of the sale of the business to the company provided that the business should be carried on in every respect as it had been hitherto until completion of the sale, and that completion was not effected until April 25th, 1912. The directors, therefore, had no control over it until after that date. The recovery from the dislocation and loss of business consequent upon the great strike of London printers was not as rapid as had been expected, but, nevertheless, progress has been steady and substantial. The directors regret that owing to the above circumstances they are not yet in a position to recommend the payment of a dividend, but look forward with every confidence to being able to do so in due course.

NEW COMPANIES.

Wernertype, Ltd.—Registered on March 19th, with a capital of £100, in £1 shares, to carry on the business of photographers, manufacturers, exporters and importers of photographic goods and accessories, general publishers, printers, lithographers, etc. The subscribers are: R. E. Gill, and H. Andrews. Private company. The first directors are R. E. Gill (governing director), and H. Andrews. Qualification of directors, £1. Remuneration as fixed by the company. Registered office: 158, Strand, W.C.

Ebell Fibre Syndicate, Ltd.—Registered on March 18th, with a capital of £1,500, in £1 shares, to carry on the business of manufacturers of and dealers in paper or pulp, cardboard, railway and other tickets, etc. The subscribers are: L. P. C. Astley, and L. W. Crouch. Private company. The number of directors is not to be less than three nor more than five. The first are J. Gowans, A. F. Saunders, and L. P. C. Astley. Registered by Nicholson and Crouch, 17, Surrey-street, Strand, W.C.

J. A. Richardson, Ltd.—Registered on March 25th, with a capital of £4,000, in £1 shares, to carry on the business of timber, iron, machinery and paper stock merchants, manufacturers of and dealers in timber, dunnage woods and materials, dealers in anchors, chains, wire and other ropes, etc., to acquire the business formerly carried on by the late J. A. Richardson, at Carron Works, Preston's-road, Poplar, and to adopt an agreement with T. E. Pike and S. H. Richardson. The subscribers are: S. H. Richardson, and T. E. Pike. Private company. The number of directors is not to be less than two nor more than five. The first are T. E. Pike and S. H. Richardson (permanent managing directors, subject to holding £20 shares). Registered office: Carron Works, Preston's-road, Poplar, E.

E. Moran and Sons, Ltd.—Registered on March 27th, with a capital of £3,000, in £1 shares, to take over the business of printers, bookbinders, engravers, diesinkers, lithographers and stationers, carried on as "E. Moran and Sons," at 20, Villiers-street, Sunderland, and to adopt an agreement with G. T. Moran and J. B. Moran. The subscribers are:—G. T. Moran, J. B. Moran and J. Wilson. Private company. Table "A" mainly applies. Solicitors, Ransom, Nelson and Maling, 21, John-street, Sunderland. Registered by Waterlow Bros. and Layton, Ltd., Birchin-lane, E.C.

B. Eastwood and Co., Ltd.—Registered on March 27th, with a capital of £5,000, in £1 shares, to carry on the business of printers, stationers, lithographers, etc. The subscribers are:—H. Ray, C. Tuttar, A. Eastwood and W. Ray. Private company. The number of directors is not to be less than two nor more than five; the first are A. Eastwood (managing director), L. Eastwood (director and secretary), both permanent (special qualification, 500 shares), and W. Ray. Solicitors, Bingham, Hall and Ritchie, 29, Princess-street, Manchester. Registered by Jordan and Sons, Ltd., 116-17, Chancery-lane, W.C.

General Publishing Syndicate, Ltd.—Registered on March 27th, with a capital of £500, in £1 shares, to take over the business of the General Publishing Syndicate, and to adopt an agreement with E. C. Blackford and F. H. Withers. The subscribers are:—F. H. Withers and E. C. Blackford. Private company. The number of directors is not to be less than two nor more than five. The first are F. H. Withers and E. C. Blackford. E. C. Blackford is managing director. Registered office, 29, Queen-square, Bristol.

COMPANY NOTICES.

LONDON LITERARY SYNDICATE, Ltd.

Notice is given, that a meeting of the syndicate will be held at 40, Sackville-street, W., on April 30th, for the purpose of having an account laid before them by the liquidator showing the manner in which the winding-up of the company has been conducted and the property disposed of, and of hearing any explanation that may be given by the liquidator.

HARDWARE TRADE JOURNAL, Ltd.

Notice is given, that a meeting of the company will be held at London, on April 25th, for the purpose of having the liquidator's accounts, showing the manner in which the winding-up has been conducted and the property of the company disposed of, laid before such meeting and of hearing any explanation that may be given by the liquidator.

PRACTICAL ENGINEERING PUBLICATIONS, Ltd.. In Voluntary Liquidation.

Notice is given, that a meeting of the company will be held at Manchester, on April 25th, for the purpose of having laid before it an account, showing the manner in which the winding-up has been conducted and the property of the company disposed of, and of hearing any explanation which may be given by the liquidator.

CROYDON PICTORIAL NEWSPAPERS, Ltd.

Notice is given, that a meeting of the company will be held at Croydon, on April 16th, for the purpose of having the liquidators' accounts, showing the manner in which the winding up has been conducted and the property of the company disposed of, laid before such meeting, and of hearing any explanation that may be given by the liquidators.

THE RE-UNION MAGAZINE, LTD.

Notice is given that a meeting of the company will be held in London on May 7th, for the purpose of having an account laid before them, showing the manner in which the winding-up has been conducted and the property of the company disposed of, and of hearing any explanation that may be given by the liquidator.

COMMERCIAL INTELLIGENCE.

Re BERNARD BROWN, Lately Printer.

The first meeting of creditors was held on March 27th, at the London Bankruptcy Court, under a receiving order against this debtor, described as of 59, Croxted-road, West Dulwich, and late of Brownlow House, 50–1, High Holborn. Mr. E. Leadam Hough, senior official receiver, presided. The receiving order was made on March 11th, upon the petition of Mr. S. Turner, bill discounter, and the debtor three days later consented to an order of adjudication in bankruptcy. He has lodged accounts showing total liabilities £1,374 19s. 7d. (unsecured, £718 11s. 7d.), and no assets of tangible value. The chairman reported that it appeared from the debtor's statements that in 1901 he became manager of Guy Whittam, Ltd., printers to the Crystal Palace, and subsequently acted as managing director of the company. The debenture holders in 1908 appointed him as receiver on their behalf and the company went into voluntary liquidation. The debtor held the greater part of the shares, but nothing was paid to the shareholders. In the early part of 1909 the debtor commenced business on his own account as a printer and advertising contractor at Ranger-road, Upper Norwood, with a free capital of about £200 and no debts. He traded in his own name until October or November, 1911, when the business was converted into a small limited company under the style of the Cosmopolitan Printing and Advertising Co., Ltd., with registered offices at Ranger-road. The capital of the company was £2,500, in shares of 10s. each, two-thirds of the number being allotted to the debtor as consideration for the business. He further became managing director at a salary of £350 per annum, but did not actually receive anything in respect of the same. Soon after it was promoted the company took offices at Brownlow House, High Holborn. The debtor at various times lent to the company sums amounting in all to about £1,270, and a Mr. E. C. Wright lent the company about £500. In September last the company, in consideration of such advances, gave to the debtor four debentures of £250 each, and to Mr. Wright two similar bonds. Then in November the debenture holders appointed Mr. Mark Brown (the debtor's son) as receiver on their behalf, and he had since carried on the business. The debtor had added that his solicitors held three of his debentures as security for advances and costs due to them, and that the other bond was held by the London and South-Western Bank (together with the certificate for his shares in the company) as security against an overdraft £120. It is anticipated that the assets of the company will be barely sufficient to meet the claims of the debenture holders. It further appeared that for many years past the debtor, in addition to his printing business, had acted as a business transfer agent, and that since November last he had endeavoured to do business as a transfer agent from his residence. Eighteen months ago the debtor obtained an option for a site for a proposed theatre at Hove, and entered into negotiations with others to exploit the venture, but in consequence of these bankruptcy proceedings he would probably have to drop out of the scheme. In December last the debtor and three others entered into an agreement to take over the lease of the Assembly Rooms at Crouch End, and to put the building in thorough repair. No profit had yet been shown under that agreement, which was still in active existence. The debtor became surety for the Cosmopolitan Printing and Advertising Co., Ltd., for about £50 in respect of printing plant supplied. He attributed his failure to the collapse of the Cosmopolitan Printing and Advertising Co., Ltd.; to heavy interest on borrowed money, and to loss of his expenditure in connection with the Hove scheme. Replying to the chairman, the debtor said he was unable to submit any proposal for the consideration of the creditors, and in the absence of any resolution the case was left in the hands of the official receiver to be wound up in the ordinary course of bankruptcy. The public examination of the debtor has been fixed for April 30th.

Appended is a list of the principal creditors, viz.:—

Unsecured.

QUADS.

[We do not necessarily identify ourselves with any opinions of our contributor. At the same time, readers will not need to be assured that he always endeavours to communicate something worthy of attention.]

"I hold every man a debtor to his profession, from the which, as men do of course seek to receive countenance and profit, so ought they of duty to endeavour themselves by way of amends to be a help and an ornament thereunto."
FRANCIS BACON, Baron Verulam.

I have before me a little penny pocket publication, "How to be a Printer," by Mr. W. H. Fairbairns (the managing director of the Campfield Press at St. Albans), published by G. Philip and Son, Ltd., 32, Fleet-street. Its sixteen pages, 5¼-in. by 3¼-in., orange paper covered, are published for a penny. Certainly it is a little brochure admirably suited to be placed in the hands of an intelligent lad, or his father or guardian.

o o o

It is issued as one of "What to be" books, "Penny Guides to Trades and Handicrafts for Youths and Girls Leaving School," the series being edited by Dr. Beckit Burnie, D.Sc., Principal of the Technical College, Brighton.

o o o

"You want to be a printer!" says Mr. Fairbairns. "Very well, my boy. Let us have a talk over what that means—what you are thinking about, and what are the pleasures and difficulties of the work. You know how keen father is in reading his paper. You know what delight you always find in books. . . .

o o o

"Well, it is a fine thing to have a hand in the making of newspapers and books, and those people who have anything to do with this business will tell you that they would not like to change their career for any other."

o o o

"Now, I am a printer myself, and it will be a very pleasant task to tell you something of that side of the work."

o o o

Mr. Fairbairn's opening will convey clearly enough the happy, easy character of his entire explanation and how welcome it is likely to be to the lad of fourteen or fifteen who is considering his life career. It would have been very senseless to write for him something high-flown, or something needlessly burdened with a display of technical knowledge. It would have been pedantry.

o o o

Mr. Fairbairns explains what different sorts of printers there are, and then deals specifically with the compositor. Incidentally, he cautions the boy not to be too grudging of his trouble nor too big for his position in his very earliest days.

o o o

The reader is spoken of. "There is no more responsible part of the craft. A well-trained compositor has some part of the necessary mental equipment for the (reader's) work, but it must be remembered, a knowledge of English alone is not sufficient for the most responsible positions."

o o o

Under the heading, "The Machine Manager," the boy finds himself advised to learn all he can of mechanics and chemistry, for it will be his duty to run machines and have a thorough knowledge not only of the component parts of the ink and oils but how to vary them.

o o o

The career of a printer's assistant "is less ambitious, and does not offer at present a very full life. The care of machines, the lifting about of paper, the feeding of the paper into the machines, the general assistance of the machine manager, is work that is, of course, quite necessary, and, as such has its dignity"—I like that last touch very much—"but it certainly is less ambitious. A strong lad will find pleasure in it, and should know that promotion is at times (though rarely) made to machine manager apprenticeship. I know of most excellent promotions; but great thought should be taken by the parent before starting a boy on this career"—of printer's assistant.

o o o

Under the heading "Stereotypers and Electrotypers" the boy learns that the work is hard. Only the strongest should attempt it. The wages are tempting. There are two branches—stereotypers and electrotypers, and stereotypers' assistants. In the first an apprentice must be indentured before he is seventeen years of age.

o o o

Regarding warehousemen and cutters we read that they "look after the paper and the despatch of the finished work to the customers. It is very responsible work. It is, perhaps, rather easier to learn than that of other branches, but, even in the top position, is not quite so well paid. The indenturing of apprentices is somewhat loose; but is becoming, and rightly so, much more strict."

o o o

The boy is warned that if he contemplates being apprenticed to machine ruling, although he has fair opportunities in this career, employment is not quite regular and safe. Again, apprenticeship is most strongly recommended.

o o o

An important counsel is given to the young reader that "self-improvement, reading, technical classes, and the like, are just as important to the boy beginning life in a small (printing) office as in a large one—perhaps more so."

o o o

I have been rather painfully impressed by the lack of opportunity of this description in provincial centres, even in fairly large towns. Lads in London, Leeds, Manchester Birmingham and a few other communities hardly realise how very much better off they are in this regard than lads in smaller provincial centres. I may be told that sometimes the lads in these smaller centres don't make full avail of such opportunities as they have; that a principal will sometimes bring quite a number of technical journals into the case-room. and they will hardly be looked at.

o o o

But which of us really does make the fullest use of all his chances?

o o o

And may it not be true that something is required to set the organism of interest, not to say enthusiasm, in motion; something to appeal to, to fire, the imagination. We ought to make wisdom's ways as pleasant and alluring as they can be made.

o o o

A good start in printing, non-workshop education is wanted in many a small centre, after which I dare say there might be enough momentum for the work to go along fairly well by its own inherent energy.

o o o

Mr. Fairbairns reproduces the ordinary indenture form, and then tells what the hours are.

o o o

"London hours are about fifty per week. Linotype and Monotype operators and readers, forty-eight. In the provinces there is much more variety, but it is expected that in 1915 there willl be a uniform fifty-one hour week." He provides this table of wages:—

	London.	Provinces (from).
Compositors	39s.	30s.
Linotype Operators ...	45s.	35s.
Monotype „ ...	45s.	34s.
Readers...	44s.	36s.
Stereotypers	44s.	38s.
Assistants	28s.	22s.
Machine Managers ...	42s.	30s.
Machine Assistants (according to class of work)	24s. to 35s.	—
Warehousemen and Cutters ...	27s. to 32s.	27s.

o o o

"Some of these figures are only approximate," he reminds us, "and to an excellent workman are certainly exceeded. Apprentices are usually paid 8s. per week for the first year, and then 9s., 10s., 11s., 12s. 6d., 15s., 17s. 6d."

o o o

I think the London Machine Managers figure is a bit on the low side.

Finally this most admirably compiled and very helpful little booklet enumerates about twenty books dealing with printing.

o o o

G. Philip and Son, Ltd., of 32, Fleet-street, the publishers of Mr. Fairbairns's booklet, would no doubt supply any of these.

FRANK COLEBROOK.

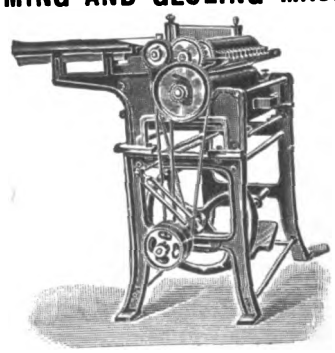
For MAKING TUBES,



IN LENGTHS UP TO SIXTY INCHES.

Illustration of Non-Automatic Tube Winding Machine which Makes Tubes from Single Boards.

Automatic Tube Winding Machine makes Tubes from the Reel.
Output, from 800-2,000 Perfectly Round Tubes in 10 hours. Tubes of any Diameter can be made up to four inches.

GUMMING AND GLUEING MACHINE

Fitted with Automatic Take-Off and Conveyor. From 6-in. to 40-in. wide for whole sheet gumming or strip work.
The most perfect machine offered and the best value.

For Full Particulars apply to:

A Printshop Knowledge Contest.

A Contest in Printshop Knowledge is announced by our enterprising contemporary, the *American Printer*, in which fifty questions relating to the printing business are submitted for answers. These fifty are but a small portion of the thousand or more that could be asked, and in submitting them it is not supposed that any person will be able to answer all of them correctly from memory or his knowledge of the business. Answers that cannot be found out in the shop or among fellow-printers can be obtained from books on printing that may be had in almost any public library or from encyclopædias. Contestants are not required to answer all of the fifty questions unless they desire to do so; the entry will be accepted even if answers are submitted to but five questions. There are hundreds of things we do not know about the printing business, and in order that we may learn them, this contest was inaugurated to furnish the incentive. In finding the answers to one-half of the questions here asked, you will be able to answer two hundred questions that you could not have answered before. It is not an advertising proposition. It costs nothing to enter, and three persons will win valuable prizes. The contest will be open for three months, beginning with February 1st and ending with May 1st, and answers can be sent in at any time.

The following are the fifty questions:—

1. What is an ink ball?
2. Does curving of electrotypes increase the printing surface?
3. What is meant by "half-bound?"
4. What is the difference between a half-tone and a line plate?
5. What is a "take?"
6. What is the difference between a two-revolution press and a drum cylinder?
7. What is a cost system?
8. Who invented lithography, and when?
9. What was the first book printed with separate types?
10. What does "set" mean in machine composition?
11. How much packing should be placed on a cylinder?
12. What is the Ben Day process?
13. What is the difference between wax-moulding and leaf-moulding in electrotyping?
14. What is a "token?"
15. What does the word "Typothetæ" mean?
16. What was the first newspaper published in the United States?
17. What is wax engraving?
18. What is a matrix comb?
19. With what should a heavy half-tone black printing ink be reduced?
20. How should a working foreman's time be charged?
21. What is meant by the offset process?
22. What is a binder's stamp?
23. With what few colours of ink can most tints and hues be obtained?
24. What is profit?
25. When and where was printing first introduced into the United States?
26. How does the atmosphere affect composition rollers?
27. What is a space-band?
28. Why is it advisable to use but one face of display type in a job of printing?
29. What is the size in inches of a 12mo. book?
30. Can a coloured tint be printed over the print of a black plate?
31. About when were composition rollers first used?
32. Who founded the New York *Herald*?
33. What does the term "sheet-wise" mean?
34. What is the difference between transparent and opaque printing inks?
35. In what way does electrotyping differ from stereotyping?
36. What causes a sheet of paper to change in size?
37. Which colour better reproduces by photo-engraving—blue or yellow?
38. What size of paper was until recently called "folio"?
39. Should the proprietor receive a salary?
40. Who was a great printer in Venice in the fifteenth century?
41. What are serifs?
42. Where on the printed book leaf should the most margin appear?
43. How is a copper electrotype shell made?
44. Should a proof of every job receive the customer's O.K. before printing?
45. What were the old names for six-point and twenty-four-point types?
46. What is the difference between coated book paper and s. and s. c.?
47. What does "30" mean in newspaper parlance?
48. When italic type faces were first used, were italic capitals also used?
49. What does "ply" mean, referring to cardboard?
50. Who was
    (a) William Caxton? (b) William Caslon? (c) William Morris? (d) William Pickering? (e) William Nicholson?

According to *Kemp's Mercantile Gazette* there was only one failure in the printing and stationery trades of England and Wales for the week ending Friday, March 28th, the corresponding week in 1912 also showed one.

Subscribers desiring information as to the taking out of Patents are invited to write. Letters to be endorsed "PATENT DEPARTMENT," Office of the "British and Colonial Printer and Stationer," 58, Shoe-lane, London, E.C. Telegrams: Stonhill, Fleet, London.

× OUR SPECIALITY. ×

TO TRADE BOOKBINDERS, BOOKBINDERS' PLANT AND MATERIAL MANUFACTURERS AND DEALERS, PUBLISHERS, LIBRARIANS, AND OTHERS INTERESTED IN THE BOOKBINDING INDUSTRY.

THE Publishers of the *BRITISH AND COLONIAL PRINTER AND STATIONER* have pleasure in announcing that an ILLUSTRATED MONTHLY SECTION of that journal is now devoted to matter concerning the BOOKBINDING TRADES.

All branches of bookbinding are dealt with, from practical and technical standpoints, and the historical and artistic aspects of the industry also receive attention. Illustrations of hand-tooled bookbindings and publishers' cases which are remarkable for their artistic design, their historic interest, or their novel character are presented from time to time.

The BOOKBINDING SECTION appeals to all those who are interested in bookbinding, whether as a trade or as an art, as all phases of the subject receive their due share of attention in its columns.

The Editor will welcome any news of trade interest that may be sent him, and is prepared to consider original articles of a technical and practical character, with a view to their publication. Information concerning the working of the technical classes in bookbinding, and notices of meetings of trade unions and other bodies associated with the bookbinding industry, are also invited; arrangements can usually be made, if desired, to report the latter, as well as lectures, etc., for the BOOKBINDING SECTION. Illustrations and particulars of new machinery and appliances, and information concerning new materials and methods for use in the trade, are likewise of interest. The publishers having no end to serve save the presentation of matter of value to the various branches of the trade, the pages of the BOOKBINDING SECTION are open to all, employers and employed, unionists and non-unionists, for the free discussion of trade matters.

As far as READERS are concerned, copies of those issues of the *British and Colonial Printer and Stationer* that contain the BOOKBINDING SECTION will be sent regularly on application, at special rates.

With regard to ADVERTISEMENTS, the bookbinding trade announcements are placed in a POSITION NEXT TO OR FACING READING MATTER in the BOOKBINDING SECTION. ADVERTISING RATES sent on application. Arrangements have been made to circulate the journal in quarters likely to be most productive to advertisers of a return for their outlay, and no effort is spared to study the interests of advertisers and readers alike.

Orders for advertisements in and subscriptions to the BOOKBINDING NUMBERS of the *British and Colonial Printer and Stationer* should be addressed to the publishers:—

STONHILL AND GILLIS, 58, SHOE LANE, LONDON, E.C.

The Detection of Faulty Sizing IN HIGH-GRADE PAPERS.

By C. Frank Sammet
Assistant Chemist, Leather and Paper Laboratory, Bureau of Chemistry, U.S Department of Chemistry).

The materials first used for sizing paper were flour, starches, and gums. Towards the end of the fourteenth century these were gradually displaced by the introduction of animal size, which has remained to the present time the standard sizing material for writing papers. The value of rosin size, which was first used at the beginning of the nineteenth century, has not equalled that of animal size for papers of this kind. This is true also of other sizings since invented, since whatever they may have in common they do not impart to the paper the characteristic effects of animal sizings.

A certain degree of flexibility is imparted to the paper by animal size, which not only adds to the strength of the sheet, but aids materially in its durability. Rosin and other sizings produce a stiffness which tends to brittleness and impairs the folding endurance, so essential for resistance to severe handling and long service. The writing and erasure qualities of animal-sized papers are generally markedly superior to those of papers sized with rosin or other sizings, and the resistance of these papers to deterioration from light, fumes, heat, and moisture is greater, due, in part at least to the fact that rosin and other sizings become discoloured and are more susceptible to chemical interaction. Furthermore, there are certain qualities, as feel, look-through, finish, and rattle, which make a well-made animal-sized sheet distinctive, and which all other sizings have failed to produce, except, possibly, when other valued characteristics are sacrificed.

Although animal sizing, when properly done with good materials, is superior to other sizings, it does not follow that animal-sized papers are better than those sized with other materials. The proper sizing of paper requires as much care and regulation as the other operations which are so closely controlled in the manufacture of high-grade paper. For superior quality it is necessary to use superior materials. Poor stock may be improved by subsequent treatment, yet the final product can never equal that made from the best stock similarly handled. Therefore, in sizing for results which can not be excelled, it is imperative that the raw materials be of the best quality, and that all the operations of sizing and drying be controlled with knowledge and skill.

The sizing of paper is sensitive to many factors, the neglect of any one of which may seriously affect the characteristic qualities sought. Care must be given to the preparation of the size, the time and degree of extraction of the hide, the temperatures employed, the nature of the water used, the cooling down, and the storage of the size to avoid contamination by destructive bacteria, which may liquefy the glue and injure its elastic covering and setting qualities. The thoroughness with which the web of the paper is sized is dependent upon the consistency of the size, the degree of penetration before drying, the temperature of the drying, and also upon the tension under which the web is dried. All soluble salts or acid which unwashed stock may contain, and even loading materials, exert their disturbing influences, and prevent the thoroughness necessary for the best and most lasting results.

Several procedures devised for the purpose of determining how well paper has been sized enable one to determine approximately whether or not a paper is ink resistant, but none are sufficiently delicate to permit close comparisons of well-sized papers. Methods based on the application to the opposite sides of the paper of solutions, which give a colour indication as they penetrate the surfaces, are open to serious objections. Error will be introduced by applying the same amount of solution to papers of different weights, as in the case of heavy paper the rate of penetration decreases more rapidly as the supply of solution on the surface diminishes through absorption and evaporation. Humidity of the atmosphere not only affects this evaporation but also the rate of absorption of the solution by the paper, depending on the amount of moisture which the paper contains. In many instances there are chemical reactions and a non-uniformity in the application of the solutions which may destroy the size. Those procedures in which the irregularities of the spread of ink or its appearance through the paper are interpreted also are seriously influenced by humidity, formation of the sheet, selective absorption, and the personal factor which enters into the interpretation of the results observed.

That any of the present tests will detect poor size, upon which ink spreads, is unquestionable, but that they will detect superiority of sizing, where the writing quality has shown no distinction, is doubtful. Nearly all writing papers have good writing qualities, whether they be sized with rosin or with the best grades of animal size, by careless or the most painstaking methods of sizing and drying. Current methods are therefore unfit to distinguish differences in the quality of sizing materials or in the character of processes.

The test herein described was devised to differentiate between the relative values of the sizings of papers which the current methods failed to detect. It was devised to determine whether there is superiority of sizing in papers dried in any particular way. The method shows marked differences in sizings, all of which are resistant to ink. It has been found, for instance, from the examination of hundreds of samples of paper representing all grades and weights that the sizing of many loft-dried papers is very inferior and is equalled by many machine-dried papers.

The test consists in drawing a strip of paper over the surface of an iron tannate ink and allowing it to drain and dry naturally. Upon examining this inked surface with a magnifying glass it will be found that a well-sized paper will show no indication of the fibre having absorbed the ink, and the entire surface will be uniformly and lightly coloured, as indicated in Plate I. In more poorly sized papers blotches of fibres absorb the ink, as shown in Plate II. and Plate III., Fig 1. Plate III., Fig. 2, shows water-leaf filter paper, indicating by the darker colours that the fibres have absorbed the ink. It should be remembered that all the papers shown in Plate I. to Plate III., Fig, 1, inclusive, are, according to the ordinary methods of testing, well sized and practically identical.

Sizings may be further differentiated by rubbing the surface of a paper with an ink eraser, brushing off the loose particles, and proceeding as directed. A paper which is well sized through will still be uniformly coloured, and the fibres will take the ink but little.

The test is valuable in showing the faults of mill practice, especially as to whether in the sizing of high-grade papers the best results obtainable are being procured. By its use the papermaker can keep his product up to a desired high standard, and the purchaser can assure himself that where the character of sizing is an important property, poorly sized papers are not accepted.

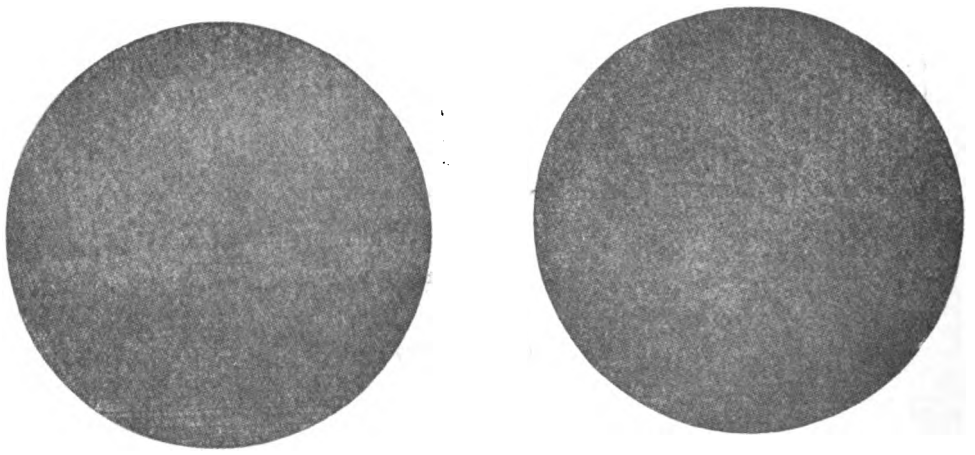

Plate I.—Appearance of a Well-Sized Paper after Test with Iron Tannate Ink.

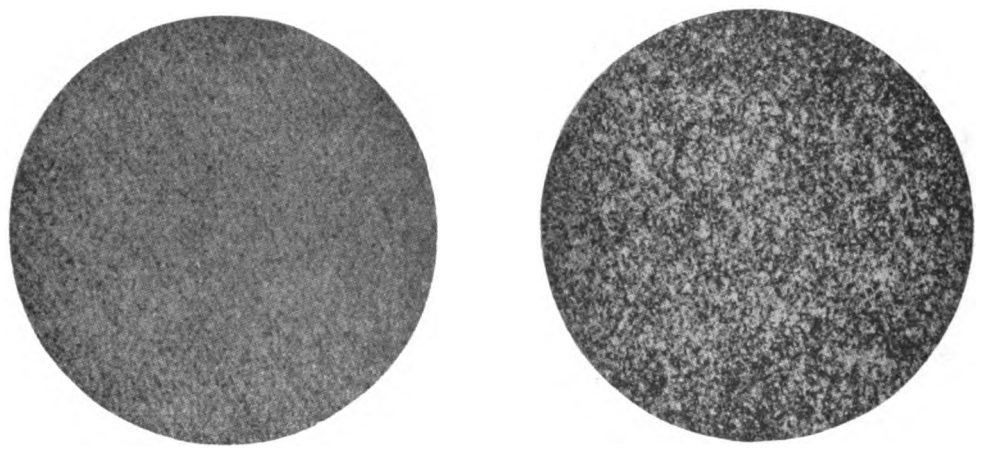

Plate II.—Appearance of Poorly-Sized Papers in which Blotches of Fibres Absorb the Ink.

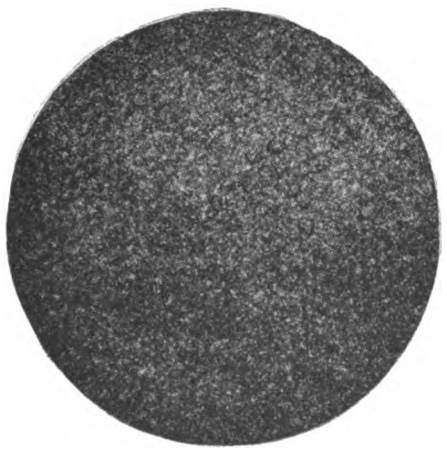

Plate III.—Fig 1. Appearance of Paper with Inferior Sizing.

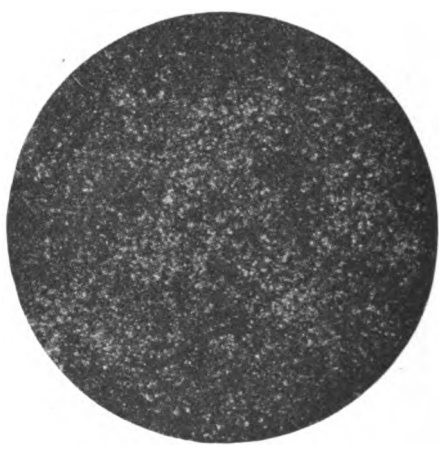

Fig. 2. Water-Leaf Filter Paper, Showing Ink Absorbed.

"MONOTYPE" COMPOSITION

THERE IS BUYING POWER FOR THE MERCHANT, MANUFACTURER OR PUBLISHER—ANY CONSUMER OF PRINTING—IN THE QUALITY OF HIS PRINTING.

Quality in printing, as well as pulling power, are found in good composition, and if you give the purchaser quality you create a satisfied customer.

There is business-building power and prestige for the printer in his ability to help his customers tell about their goods in an attractive and forcible way.

Advertisers want distinctive faces: and distinctive faces—to set by hand—cost money.

THE MONOTYPE COMPOSING MACHINE IS THE ONLY EFFICIENT MACHINE THAT GUARANTEES A PRODUCT EQUAL TO NEW FOUNDRY TYPE SET BY HAND, AND IS, IN ADDITION, A COMPLETE TYPE FOUNDRY, BECAUSE IT WILL CAST ALL DISPLAY TYPE, BORDERS, ORNAMENTS AND SPACING MATERIAL UP TO AND INCLUDING 36 POINT.

THE MONOTYPE IS THE MACHINE OF GREATEST PRODUCTIVENESS, HENCE THE GREATEST PROFITABLENESS.

Composed and cast on the Monotype.

WHAT IS AN ELECTRO

With the Trouble left out?

An electro of the right sort—the sort we make—IS an ELECTRO with the TROUBLE LEFT OUT.

This is the sort of electro you have been looking for,—the electro you want and which we want you to have.

An electro possessing a substantial shell of hard tough copper– a shell that will not peel; an electro with a level face and securely mounted on well-seasoned dry wood, planed true to just a shade under type-high (the ideal height for all blocks); an electro which has had every care and attention bestowed upon it in every stage of its manufacture; an electro produced by the most up-to-date and efficient machinery that money can buy, in the hands of the most skilled and efficient staff that can be got together. And this with a rapidity that no other house in the trade can equal.

You ought to See

our four large floors containing thousands of pounds' worth of the best and latest types of machinery employed in making electros. If you could see this plant in full swing, you would then fully realise that in all-round quality and speed of production we can give you a service that has never before been attempted. If you cannot come to see us, send your representative in the shape of a trial order for AN ELECTRO WITH THE TROUBLE LEFT OUT.

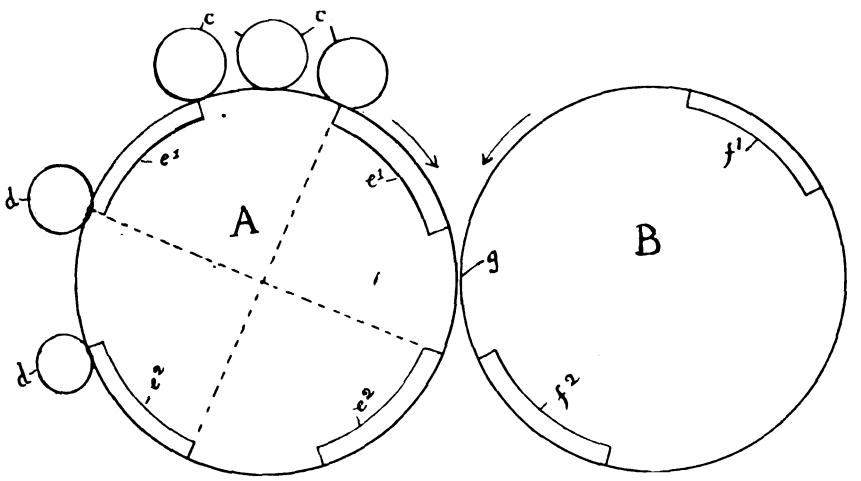
Copperplate Printing.

Rotary copperplate printing machines comprise a roll with a curved block and a compression roll carrying the sheet to be printed and provided with a packing. This new French invention, by Mr. E. Bernard relates to machines in which the engraved plate passes under one or more inking rolls and several wiping rolls, before being subjected to pressure. When moving in contact with the wiping rolls, the block has, preferably, a transversal motion so that the successive work of these rolls will be in different directions.

In this invention one inking roll and one wiping roll can be employed for two blocks on the same roll. This increases the production two-fold for a same number of revolutions, without doubling the diameter of the printing roll. The dimensions of each of the blocks, diametrically opposite, are estimated from this double point of view.

1. Pressure should not commence until transversal motion of the printing roll has ceased, and this motion cannot begin again until pressure has ceased.

2. Inking should not begin until the transversal motion has ceased, and it cannot begin again until inking is finished.



In the accompanying drawing A is the printing roll and B the compressing roll revolving in the direction of the arrows; c indicates the wiping rolls, for example, three in number, over which cloths run and which revolve for wiping; *d*, the inking rolls, for example, two. The two blocks e^1 e_2 are mounted on the roll *a*, at the two extremities of a same diameter.

The compressing roll *b* is provided with two packings f^1 f^2, corresponding to the two blocks e^1 e^2. When block e^1 has its head opposite the first wiper *c* and its tail at e^1, the tail e_{1_2} of block e_2, diametrically opposite to $e^1{}_1$, should have been released from pressure. The point of contact, *g*, of the two rolls *a* and *b* cannot, therefore, be further in the direction of rotation than the point $e^1{}_2$. On the other hand the tail of block e_1, should have passed beyond the last wiper *c* (position marked in broken lines) when its head comes under pressure at *g*. Thus there must be, between the last roll *c* and the point *g*, at least the length of a block. In passing over the roll *a*, in the direction of rotation, from e^1 to e^2, *i.e.*, a half circumference, there must be the length of a block from e^1, to the first wiper *c* and likewise between the last wiper and e^2. The half circumference of roll *a* must therefore comprise two lengths of block plus the distance between the two end wipers.

When it is not desired to give the blocks a transversal motion during inking, there must be, passing over roll *a* in the direction of motion, a half circumference plus the length of a block between the last wiper *c* and the first inker *d*, and between the last inker *d* and the first wiper *c* the length of *a* block.

Therefore in this case a half circumference must comprise not only two lengths of block plus the distance the two end wipers, but also the distance between the two end inkers.

Diameter of roll *a* will therefore be greater than in the first instance. If both conditions are fulfilled which enable

the relative dimensions of the blocks and cylinders to be fixed, work is as follows:—

The sheet to be printed is applied, in any known manner, to the packing f^1; at the same time block *e* passes on the wipers *c* and the roll has a transversal motion, the block e^2 not having yet arrivd at the inkers *d*. Then transversal motion stops, block e^1 is brought under pressure whilst e^2 is inked. The printed sheet is taken off in the ordinary way.

When block *e* is relieved from pressure transversal motion recommences and block e^2 passes under the wipers *c*. At the same time a new sheet of paper is laid on the packing f^2. When e^2 is wiped transversal motion ceases, e^2 runs under pressure whilst e^1 is inked and so on.

The two blocks need not necessarily be of the same dimensions, and inking and wiping can be regulated for each.

It suffices, for example, to place opposite each block, a cam of suitable length to regulate the length of inking and wiping. The inkers and wipers will then only successively come into contact with the corresponding plate during the passage of this cam.

Any known devices can, of course, be adopted to fix the blocks on the roll, the packings on the pressure roll driving the rolls conveying the sheets to be printed and laying them on the packings, etc.

Likewise the blocks employed may be thin or thick and their fastenings consequently varied.

Printers' Managers and Overseers ASSOCIATION.

Impressions of the Visit to Nottingham.

The lecture announced for the April monthly general meeting of the London (Parent) Centre had to be postponed at the last hour, owing to the indisposition of the lecturer, and a "smoking concert" was arranged and successfully carried out under the direction of the Vice-president, Mr. T. A. Catling. This, together with the inclement weather, no doubt accounted for the poor attendance. The chair was occupied by the President, Mr. C. J. Gray, and in the absence of the Assistant-Secretary, Mr. C. Morley, the minutes of the March meeting were read by Mr. W. Cole, and were confirmed. The following candidates for membership were duly elected, viz.:—Mr. F. D. Bradford (Messrs. W. Brendon and Son, Ltd., Plymouth, composing); Mr. T. H. Emerick (Press Printers, Ltd., machine), and Mr. H. T Potter (Messrs. Harrison and Sons, litho).

The PRESIDENT made a few remarks on the visit paid by the Secretary and himself to Nottingham the previous Saturday to attend the first annual dinner of the North Midlands Centre. Representatives came from Manchester, Liverpool, Birmingham, Leicester, Lincoln, and one or two other places, and they were most enthusiastic about the forthcoming Liverpool Joint Meeting on June 21st. He had again to express his thanks for their cordial reception, and also his admiration of the enthusiasm in the affairs of the Association shown by members in the provinces. Members brought their wives all the way from Manchester, which they did not reach again on the return journey until 4 or 5 o'clock the next morning, and members who were willing to do that sort of thing to help the Association along must have genuine enthusiasm in the cause. He hoped all the London members who could possibly do so would attend the Joint Meeting at Liverpool. The Council were doing their best to get reduced railway fares, and the Liverpool members, he knew, were doing all they possibly could in providing for their hospitable reception. They were impressed with the conditions prevailing in Nottingham, where the employer seemed to get into closer touch with the employees than was the case here. He thought the enthusiasm and bonhomie shown by the provincial members made a demand upon them to show a similar spirit. The President added that whilst at Nottingham they had the pleasure of going over Messrs. Boots' Printing Works, and it was an eye-opener to most of them. They had never seen a cleaner place, which was doubtless due to the fact that it was not run on competitive lines. Every consideration was shown for the employee; they had a roof garden, and a gymnasium for girls with an instructress. They possessed the finest machine-room he had ever seen, and a most up-to-date plant connected with the manufacturing stationery business. About 600 hands were employed. They owed this visit to the kindness of Mr. C. J. Budden, the genial president of the North Midlands Centre, to whose enthusiasm and hard work in connection with the Association the rapid progress it had made

Digitized by Google

in its twelvemonths' existence was largely due.

Mr. MOYCE pointed to another example of the consideration shown to their employees by Messrs. Boots. A notice was stuck up on the walls of all departments informing the employees that the principal had noted that frequently illness had occurred amongst the staff because when feeling a little unwell an employee had neglected to see a doctor at the commencement of an illness, and a long illness which might have been prevented had resulted. Therefore he had engaged a doctor who attended the works on certain days and hours for men and women, and all advice and medicine was free. Another instance of Mr. Boot's kindness of heart mentioned by Mr. Moyce was in connection with his fondness for organ music, he having bought an organ, had it put in the Albert Hall, Nottingham, and engaged an organist, so that anyone who wished could attend recitals given there free. Although an invalid, Mr. Boot's mind was as vigorous as ever, and he was sure everyone wished him long life and the exercise of his active brain in his business for many years to come. (Applause.)

The CHAIRMAN then called upon Mr. H. Laughton to open the concert with a pianoforte solo, which he contributed in brilliant style, and during the evening he proved himself an accomplished accompanist. Two capitally rendered baritone solos were next contributed by Mr. Reg. Penson, viz., Sargent's fine song, "Blow, blow thou winter wind" and the nautical ditty, "A sailor's life for me." Mr. Stephen Moorcroft, the happy possessor of a powerful tenor voice, found ample scope for it in his song, "Nirvana," and in his second effort gave an equally pleasing rendition of "The Last Watch." Messrs. Basil Sharman's and Reg. Penson's voices were nicely blended in an excellent interpretation of the old favourite duet, "Excelsior." Miss Ada Moyce sang with much feeling a pretty song, "Idle Words," and was equally successful in her second song, "My Ships." Some excellent violin solos were contributed by Mr. Arthur Jones, displaying an enviable mastery of that instrument, and his encore—more rare for instrumentalists than vocalists—was well merited. Comic turns were in the capable hands of Messrs. Belcher and Fred Hylton, the former creating great hilarity with his funny interpretations of "I could not distinguish the words," and "Water Scenes," and the latter winning popular receptions in "Our Wedding" and "Music Hall Shakespeare." Mr. Basil Sharman sang in very pleasing style "Take a pair of Sparkling Eyes" and the pretty Devonshire song, "Going a'courting." Mr. Fred Clements displayed his rare and varied talents as an impersonator in the humorous recital "The Caretaker," preceded by some well-told anecdotes, and "A Few Impressions," including some really clever impersonations, without "get-up" of any kind, of Uriah Heep, Micawber, Fagin in the condemned cell, and the Old Grandfather and the death of Nell, from Dickens "Old Curiosity Shop." Miss Shakell was one of the successes of the evening, giving an admirable rendering of the difficult song, "My Rosary," and her fine soprano voice was heard to advantage in "The Jewel Song" (Faust), in which she was effectively seconded by Mr. Stephen Moorcroft. An enjoyable concert closed with the singing of "God Save the King."

It is worthy of note that the Monthly Circular of the Association announces the completion of Pension No. 2, a total of £400 5s. having been paid to the Printers' Pension Corporation for that purpose, thus establishing in perpetuity a pension of £16 per annum. The hope is expressed that a small balance remaining over may be increased to about £25 before the end of the year, so that the Pension may be augmented to £17 per annum.

Testing the Porosity of Papers.

In the *Wochenblatt*, Mr. W. Colditz discusses the question of the sizing of printing papers. Many printers and papermakers are under the impression that the sizing of the paper directly influences its absorption of the printing ink, just as in the case of writing papers where a water-ink is employed. As a matter of fact the sizing has only a small and indirect influence on the printing qualities of the paper by the addition of a little colloidal matter which tends to close the pores. The writer cites a case where the printer complained of a paper being too absorbent so that the next delivery was sized very much harder. Tested with writing ink this second paper proved quite hard sized, but none the less the same complaint as to its absorbency for printing ink came again from the printer.

What is really wanted for testing printing papers is some test by which the penetration of oil or varnish through the paper may be measured. A satisfactory test of this nature the writer has so far failed to find. It is, however, possible to test the printing qualities of a paper, at all events for all ordinary engine-sized papers, by determining the porosity of its structure. The greater the volume of the air spaces in the structure of the paper, the greater will be its absorbency for printing ink, and *vice versa*. A measure of this quality may be obtained by dividing the apparent specific gravity of the paper by its real specific gravity. The apparent specific gravity is easily calculated by ascertaining the volume and the weight of a convenient unit of the sample. The determination of the real specific gravity needs a little more preparation. This requires a glass sinker which has previously been weighed suspended from the arm of a chemical balance, once in air and subsequently totally immersed in water and again in olive oil. The sinker must be large enough to contain a weighed piece of the paper which is placed therein and then steeped for at least half a day in the olive oil. The olive oil penetrates all the pores of the paper and gradually displaces all the air therefrom, for which a sufficient time must be allowed. The temperature both of the water and the oil must be the same at each time of weighing.

The following example illustrates the operations to be performed:—Weight of the paper in air, 0·1422 gramme; weight of empty sinker in air, 20·1392 grammes; weight of ditto in water, 12·334 grammes; weight of ditto in oil, 13·013 grammes; weight of sinker containing paper in oil, 13·060 grammes. Then the weight of oil displaced by the paper is 13·1552 − 13·060 = 0·0952 gramme. The temperature of weighing was 23·7 degs. Centigrade, and the specific gravity of the oil at this temperature was

$$\frac{20{\cdot}1392 - 13{\cdot}013}{20{\cdot}1392 - 12{\cdot}334} = \frac{7{\cdot}1262}{7{\cdot}8052} = 0{\cdot}9130$$

which has to be reduced so as to be in comparison with water at 4 degs. C.: 0·9130 × 0·9974 = 0·9107. The real volume of the paper in cubic centimetres is then calculated as

$\frac{0{\cdot}0952}{0{\cdot}9107} = 0{\cdot}1045$ so that its real specific gravity is $\frac{0{\cdot}1422}{0{\cdot}1045} = 1{\cdot}1361$. If the apparent specific gravity of the paper be divided by the real specific gravity, the lower the value so obtained the more porous and absorbent will be the paper towards printing ink.

ACCORDING to the figures given in the "American Newspaper Annual and Directory for 1913," the number of daily newspapers in the United States is 2,633. The number of weeklies is 17,285, a gain of 27. The special classifications of publications are 208, covering almost every field of human effort. Woman suffrage, for example, has 10 publications; automobiles and motors have 67. Publications of more than 40 secret society orders are catalogued, and foreign language papers printed in 35 different tongues are described in 35 classifications of their own.

Subscribers desiring information as to the taking out of Patents are invited to write. Letters to be endorsed "PATENT DEPARTMENT," Office of the "British and Colonial Printer and Stationer," 58, Shoe-lane, London, E.C. Telegrams: Stonhill, Fleet, London.

Treat the Traveller Well.

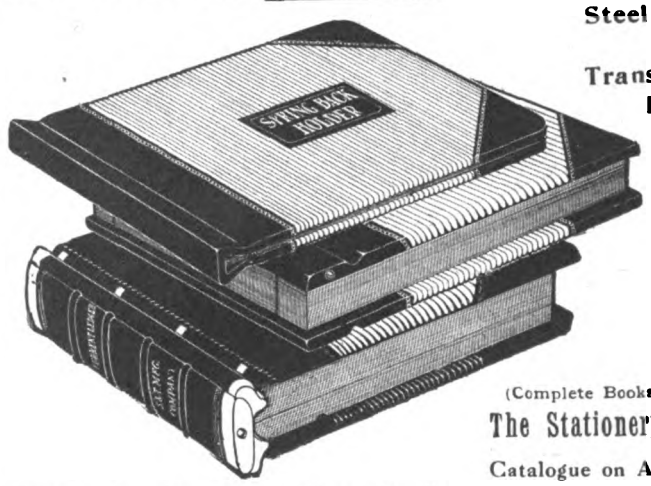
Like the mother-in-law, so famous in song and story, and so many thousands of times the subject of jokes and jests, the travelling salesman is seldom appreciated by the man upon whom he calls. Too often, says a writer in *Iron Age Hardware*, he receives scant courtesy and little or no consideration. Often he is regarded by the retail merchant as a necessary evil—necessary because unavoidable—but always as an evil. As a matter of fact he ought to be regarded as a source of information, in importance second only to the trade journal. He ought to be your friend, and you his. The fact that he is looking for trade ought not to prejudice you against him, nor tempt you to refuse to become intimate with him. The order book which he carries in his hip pocket is not a revolver, nor a Gatling gun, and if he does draw it occasionally, and requests you to sign the dotted line, it won't kill you. Suppose you were to close your door to all travelling salesmen—how much would you learn of the work of the outside world? How many profitable opportunities would you obtain? How many new and effective means of advertising would be brought to your attention?

The average travelling salesman is not half so black as he is painted. He is not a scoundrel, and he is not always planning to part you from your cash regardless of whether he can be of any benefit to you or not. As a matter of fact, he is a man who works hard for an honest living, and, when you come to make investigations, you will find that he is remarkably like yourself. In thousands of cases he exhibits almost infinite patience, receiving your coldness and lack of interest or consideration with wonderful good nature, often in spite of the fact that he knows beyond peradventure of doubt that he is offering you a proposition of great value, and that you are turning a deaf ear, not to him only, but to your own best interests.

In many instances the travelling salesman offers you an investment that means a far greater profit to you than it does to him or to the house he represents. For it cannot be denied that the retail merchant's profits are frequently very much larger than those of the manufacturer on dollar for dollar invested.

Of course, an impertinent travelling salesman deserves no consideration at the hands of any merchant, nor does a salesman who is objectionably aggressive, but how many travelling salesmen are impertinent or objectionably aggressive? Are they not, as a matter of fact, for the most part men of courtesy, and in many instances tactful and diplomatic? When *you* sell goods, you sell them under the most favourable conditions in the world. Your customers come to *you*; you do not have to seek *them*. They come prepared to buy and with the intention of buying or they would not have entered your store. They not only give you their immediate and undivided attention, but when you are engaged they wait your convenience, and they nearly always listen to your recommendations cheerfully and willingly. Contrast your business conditions with those of the travelling salesman. Customers never come to him; he is always seeking them; and when he finds them, their attitude is to resist his offers, whatever they may be, in consequence of which they give him scant courtesy and small consideration.

Moreover, it is not unusual for a merchant to keep a travelling salesman waiting for from fifteen minutes to an hour or an hour-and-a-half before granting him an interview. Nevertheless, a travelling salesman must never be disgruntled nor anything short of smiling or urbane in his manner, no matter how much time you may have made him waste, and no matter whether he receives an order from you or not. In any event, he must thank you for the courtesy of an interview, and leave you with the impression that he feels that you have done him a particular favour in allowing him to talk to you at all.



In view of the fact that in the matter of purchasing you are always the judge, and that you are never—under any circumstances—obliged to buy unprofitable goods or unsaleable goods, would it not be to your advantage to give the travelling salesman the same treatment you would wish to receive if you were a travelling salesman? A travelling salesman, after all, is just as human as you are. He appreciates courtesy and consideration as much as you do—probably more than you do—for they are rare in his life, and common in yours.

If you are too busy to see a travelling salesman, tell him so, and let him go on his way. Don't keep him waiting when it means merely wasting his time. When you do grant him an interview, let it be under favourable conditions, not where you will be constantly interrupted by your clerks and customers. Give his proposition, whatever it may be, your honest and careful consideration. If his proposition does not appeal to you, you can always dismiss the salesman in a courteous manner, and do not lose sight of the fact that it is distinctly to your advantage to do so, for there is no knowing what attractive offer he may have to make when next he visits your town.

THE *Monotype Recorder*, the house organ of the Lanston Monotype Corporation, Ltd., appears in its current issue in a new style, printed on a toned paper, with a matt surface, that is extremely pleasing to the eye, and that shows up the letterpress well. The cover is in a pale brown, with a boldly designed border in dark colours. The contents of the *Recorder* show well the excellent work that can be produced with type cast on the Monotype machine, and its pages are well worth the study of the printer who desires to excel in his art.

"HOW TO FORM A COMPANY."—This is the title of a useful little book, mainly a reprint of a lecture entitled "The Promotion and Flotation of Limited Companies," given by Mr. Herbert W. Jordan (managing director of Jordan and Sons, Ltd.) recently, under the auspices of the Secretaries' Association. The history of companies is briefly dealt with, and such subjects are discussed as registration statistics, the utility of the Joint Stock system, purpose of formation, registration, memorandum and articles of association, the prospectus, vendors' shares, debentures and statutory meetings. This is supplemented by an appendix setting out the special features of private companies.

Rotary Newspaper Presses.

At an informal meeting of the Junior Institution of Engineers, at 39, Victoria-street, Westminster, S.W., on Friday evening, an interesting lecturette on "Rotary Newspaper Presses" was delivered by Mr. H. J. Coventry (R. Hoe and Co., Ltd.), and awakened a considerable amount of interest among the members.

Mr. Coventry began with a description of the terms "rotary, web, perfecting," and of the characteristics of single and double width presses. In general principle, he said, there was but little difference between a small single width machine and a large double width. Whatever the size of machine the speed of rotation of the main type cylinders is in the region of 250 r.p.m. The linear speed of the web varies of course with the diameter of the cylinders; 700 to 1,100 feet per minute is common. A description of the general features of a newspaper press followed, including the manipulation of the stereo plates, the inking arrangements, the mechanism for compensating for any inequality of tension in the web on either side, the paper roll brake control, the turner bars, pasters, late news devices, the folder with its method of folding and delivery, and quire counting. The final portion of the paper dealt with main drives, which the lecturer stated must be as flexible as possible, and the acceleration smooth and steady, provision being made at the same time for driving the press very slowly, or "inching," as it is termed, when plating or blanketting the cylinders. Motor equipments he roughly classed under three heads, viz., (1) single motor and ordinary hand controller used only for small machines; (2) main and auxiliary motor sets; (3) motor generator sets. The horse-power absorbed, he added, varies from about 25 for a two-roll single to 120 or 150 for a double sextuple.

Numerous questions were put to Mr. Coventry at the close of his lecture, having reference among other matters to the complex control gear, the late news device, and the method of stamping the coloured seal on evening newspapers stating the time of the edition. The method of producing and manipulating the stereo plates came in for a good deal of attention, and reference was made to the Autoplate machine. An enquiry relating to the paper roll, brought out the remark that the nominal length of a roll is about five miles, and it lasted about twenty minutes in the newspaper press. On the subject of main drives and the prevalence of electric motors for newspaper presses, one member remarked that he knew of a case where some printing machines were driven by steam turbines situated underneath the floor of the machine-room.

An interesting discussion was brought to a close with a formal expression of thanks to the lecturer.

SAFETY VACUUM **Bronzing Machine**

(MARK SMITH'S PATENT).

A Picture Post Card Dispute.

In the City of London Court, on Thursday last, before Mr. Registrar Wild, a claim was made by Messrs. A. and G. Taylor, photographic publishers, 9, Long-lane, against A. Baldwin and Son, stationers, High-street, Chatham, Kent, for the price of picture post cards supplied in the way of trade. The plaintiffs' representative said that the defendants had been supplied with picture post cards. The defendants had stated they had received 17 packets of "glazed views," and the plaintiffs had only sent eight packets and nine packets of birthday post cards, of which nothing was said. There was also sent seven packets of Child Studies. For those the plaintiffs were charging 3s. 6d., and the balance of the claim was made up of small deductions made by the defendants from time to time. A witness for the defendants said that on September 21st she received a parcel of picture post cards from the plaintiffs. No invoice was sent with the goods, and she made a note of the cards received. There was, according to a statement subsequently delivered by the plaintiffs' traveller, a half gross of cards short delivered on that occasion. The defendant, Mr. Baldwin, said that the plaintiffs' invoices, as they were sent in from time to time, contained overcharges. He marked the overcharge on them at the time, and then settled the matter with the plaintiffs' traveller when he called. He did not owe the plaintiffs the amount claimed, because part was in respect of post cards not received and the balance for overcharges. The plaintiffs representative, in answer to the Registrar, said that the traveller referred to was no longer in their service. The Registrar said it seemed to him that the plaintiffs' agent had gone into the matter with the defendants, and settled the invoices from time to time. If the agent did not inform the plaintiffs of this that was their look out. He (the Registrar) could not do as the plaintiffs now wished him to do—re-open accounts which had been settled. If he did so there would be no end to business transactions. Under the circumstances, there would be judgment for the defendants, and they would be allowed 17s. 6d. costs and expenses.

Diaries and Insurance.

Sir,—When publishing our Diaries for 1912, we made special arrangements whereby the trade were enabled to accept fees for registration from customers wishing to insure under the coupons given with our Diaries, retaining for their trouble 25 per cent. of such fees. In putting this scheme into force we did so in the belief that, besides being a convenience to the public, it would be very much to the advantage of the trade, as it would place a very considerable sum—thousands of pounds annually—into their hands. It was, therefore, a disappointment to us to find that the trade, with a certain number of exceptions, took the matter up in a manner which can only be described as lukewarm.

Apparently, however, there is a general wish that the scheme should be reinstated, as we have been approached with that idea by the secretary of a branch of Retail Newsagents, the Stationers' Federation, the Stationers' Association, the Associated Booksellers, the Brighton and District Stationers' Association, besides by a number of individual firms.

We have given the matter our careful consideration, and have made arrangements with the General Accident Fire and Life Assurance Corporation, so that we can revert to the arrangement in operation two years ago.

In conclusion, we would say that there are considerably over a million coupons circulating annually, and that nearly all the people insuring cover the risks on which a shilling registration fee is payable, and that there is no reason why the great majority of persons who insure should not pay their registration fee to the stationer at the time they purchase the diary. As already stated, this means, at a moderate estimate, putting several thousands of pounds annually into the hands of the trade.

We should like to know the wishes of the trade generally on the matter, and shall be pleased to hear from anyone interested.

Yours faithfully,
Charles Letts and Co.

Seasonal Trades, by various writers. edited by Sydney Webb, LL.B., and Arnold Freeman, M.A. 8vo. xii. + 410 pp., cloth. London: Constable and Co., Ltd. 7s. 6d. net.

Although the printing trades are not specifically dealt with in this most interesting volume, there are numerous references to them, and the causes and results of seasonal slackness in various industries, as set out by the writers of the different articles are well worth reading, and in many cases of distinct application to those trades in which we are more interested. The Board of Trade recognises that in the printing business "seasonal fluctuation is a prominent and regular phenomenon," August being the slackest month of the year. Even then, however, an effort is generally made to retain a nucleus of skilled writers. In this industry the slack season and the holiday season coincide. Before it arrives the printers and publishers are working full time, partly in order to provide for it, and thus when it arrives there is but little, or nothing, for them to do in that particular direction. In some industries the worker, when laid aside temporarily by the constantly recurring seasonal "slackness," seeks occupation for a time in some other line, but although seaside apartment letting and harvesting are then in full swing, few, if any, compositors, we should imagine, turn to them in such times of need. Still, the descriptions, always interesting, if somewhat sad, of the shifts of this kind indulged in by certain classes of workers, are decidedly worthy of careful perusal, and the text is well elucidated by numerous statistical diagrams

A Bill introduced by Sir John Dewar seeks to amend those sections of the Public Libraries Acts (England, Scotland, and Ireland) which relate to the amount of the rate to be levied for carrying out the provisions of the Acts. The limit of one penny in the £1 imposed upon the library rate of 1855 still remains, but about thirty library districts have varied the principal Acts by special legislation giving increased rating powers. This Bill extends the power to levy a library rate from one penny to twopence in the £1. It leaves the amount of the rate entirely in the discretion of the library authority, subject, however, to this limit not being exceeded except in districts whereby, by any local Act, power is given to levy a higher rate. The Bill also enables County Councils to adopt the Public Libraries Acts, and to become library authorities, but it exempts districts already rated for library purposes from any library rate levied by a County Council.

Trade Notes.

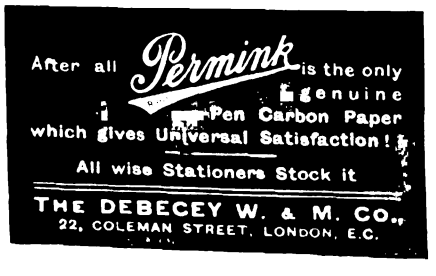
THE death is announced of M. Emile Duploye, the inventor of the system of shorthand known as Sloan-Duployan. M. Duploye was eighty years of age,

MR. THOMAS E. BINGLEY, lithographer to the trade, has removed from High-street Leicester, to larger and more commodious premises at Highcross-street, in the same town.

A SOCIAL EVENING will be held on Saturday next by the students of the bookbinding and allied classes at the L.C.C. Central School of Arts and Crafts, in the National Sunday League Hall, Red Lion-square.

THE death is announced, at Jersey, of Mr. Byron Webber, at one time on the staff of the *Sportsman*. He wrote several novels and a good deal of verse, his "Hands Across the Sea" being known all over the world.

ACCORDING to *Kemp's Mercantile Gazette* there were four failures in the printing and stationery trades of England and Wales for the week ending Friday, April 4th, the corresponding week in 1912 showed two.



MESSRS. MARION AND CO., after fifty-two years' occupancy of the premises at 22–23, Soho-square, W., have now removed to much larger and more commodious premises at No. 3 of the same square, almost opposite the old site.

THE death took place last week of Lady Pitman, widow of Sir Isaac Pitman, of phonographic fame. Lady Pitman was 88 years of age, and herself a phonographer, and took great and practical interest in the development of the system of her husband and sons.

THE annual dinner of the Machine Rulers, Bookbinders, Printers and Kindred Trades Overseers' Association will be held at the Salisbury Hotel, Salisbury-square, E.C., on Saturday, 19th inst. Tickets may be had from the secretary, Mr. George A. Eden, 9, Murillo-road, Lee, S.E.

A LARGE number of printers, bookbinders and kindred trades held a mass meeting at the Cooper Union, New York, the other day, under the auspices of the Allied Printing and Bookbinding Trades Association of America, to devise ways and means for demanding the enactment of tariff laws that will equalise the difference paid to labour in those and kindred industries in Europe and in the United States of America. They further demanded that printing, bookbinding, publishing, composition, photo-engraving, lithographing and kindred industries shall be safeguarded and preserved by equitable laws, so that the American mechanics and employers shall be safeguarded against the competition of low wages, long hours, unrestricted child labour, and other sweat-shop conditions in European countries.

PROSPECTUS PRINTING.—In the City of London Court, on Thursday last, before His Honour Judge Lumley Smith, K.C., a claim was made by Messrs. Mead, Burt and Co., Ltd., proprietors of the Devonshire Press, 14, Devonshire-street, E.C., against Messrs. W. W. Wreford and Co., 28, Martin's-lane, Cannon-street, E.C., and Mr. Herbert Kettle, 70, Finsbury-pavement, E.C., to recover £25 for printing company prospectuses,etc. Plaintiffs originally sued Wreford only, but he said that Kettle owed £16 of the amount claimed Kettle had therefore been added as a co-defendant. Plaintiff said that the order was received by their traveller Gover, who said it came from Wreford. Then Wreford said he must look to Kettle. Gover said he understood it was Kettle's business. He did not say the work was for Wreford. Defendant Wreford said he had an office at Martin's-lane, Cannon-street, and allowed Kettle a seat in it for old association sake, as he had known him for 15 years. Kettle was promoting a company and gave the plaintiff the disputed order sued on. He (defendant) had nothing to do with it. He consented to judgment for £8 11s. 1d. for other business which he gave to the plaintiffs. Judge Lumley Smith found for the plaintiffs for £8 11s. 1d. against Wreford, and for £16 9s. against Kettle, with costs.

THE *Marconigraph* has developed into magazine form, and will in future be known as the *Wireless World*. It is to be issued monthly at 3d.

A SMALL volume, measuring only ¾ inch by ⅝ inch, entitled "The English Bijou Almanac for 1838," was of the smallest books ever printed, was sold for £4 8s. at Sotheby's on Thursday last.

THE death has occurred at Selkirk, of Mr. Walter Thompson, printer and publisher. He had carried on a printing and publishing business, and for 16 years he was the proprietor of the *Saturday Advertiser*.

WE understand that Mr. George Rowland Blades, of Messrs. Blades, East and Blades, the well-known printers, is a candidate for the vacancy in the Corporation in Candlewick Ward, caused by the death of Mr. G. Everest Ellis.

AT a meeting of Middlesbrough, Stockton, West Hartlepool, and Darlington Pressmen at Stockton, on Saturday night last, a new branch of the Newspaper Press Fund, to be known as the South Durham and North Yorkshire District, was formed.

ON the petition of the Anglo-Japanese Bank, Ltd., Mr. Justice Swinfen Eady has made a compulsory order for the winding-up of the Japan Press, Ltd. Counsel stated that the petitioners were creditors who recovered judgment against the company for £233.

THE current issue of our contemporary, *Photography and Focus*, is for the second time illustrated by the new rotary photogravure process, which lends itself to the reproduction of artistic examples of photography in a pleasing manner. Our contemporary is to be congratulated on its enterprise.

TENDERS WANTED.—For printing contribution cards for the National Health Insurance Commission; particulars from the Controller, H.M. Stationery Office, Westminster, S.W. For a supply of stationery and drawing office materials for the Bristol Docks Committee; forms of tender from Mr. W. W. Squire, Cumberland Basin, Bristol. For the supply of account books and stationery to the Edmonton Urban District Council; particulars from Mr. W. F. Payne, Town Hall, Edmonton.

THE Duchess of Sutherland will on Saturday, April 26th, open at Rochdale a handsome and commodious Crippled Children's Home, which has been erected by Mr. Walter Scott, J.P., proprietor of the *Rochdale Observer*, in memory of his late wife, who was for many years deeply interested in the work of ameliorating the lot of crippled and deformed children. The new institution, which with the estate, will cost nearly £10,000, is most completely fitted up for curative and ameliorative work, and is situated in one of the highest and healthiest parts of Rochdale.

A PRINTER'S COST CONGRESS will be held under the auspices of the Manchester and Salford Association of Master Printers, Lithographers and Bookbinders, and the Master Printers' Associations of Lancashire and Cheshire, on Wednesday, April 23rd, in the Albert Hall, Peter-street, Manchester. Several papers will be read, and a general discussion on matters of interest to printers will take place. Mr. H. Cooke, Mr. W. Howard Hazell, and Mr. R. Austen Leigh, who were the principal speakers at the London conference, will take part in the proceedings, to which all master printers in the district are invited.

THE UNINSURED PRINTER.—In the City of London Court, on Monday, before His Honour Judge Lumley Smith, K.C., Ernest Tritton, printer, Churchyard-row, Newington-butts, sued his late employer, Moiz Bril, printer, 22, Stoney-lane, Houndsditch, to recover compensation for personal injuries which occurred to him while working for him on a cropper machine. Mr. Ganzoni appeared for the plaintiff. Tritton said that he was only in the defendant's service for an hour and a-half when his right hand was caught in the machine. His hand was badly cut, and he had been unable to work since. He was to be paid 27s. 6d. per week. He had been a printer for seventeen years. Defendant said the accident resulted from the plaintiff's own culpable negligence. The accident was done deliberately as the plaintiff ran the machine at an excessive speed. He only employed the plaintiff out of compassion. He was to be paid sixpence for an hour's work and that was all. He had paid the plaintiff about 30s. since the accident. He was not insured. Judge Lumley Smith awarded the plaintiff 7s. a week until further notice.

PRINTERS' MEDICAL AID ASSOCIATION.—One of the most successful concerts ever organised in the printing trade was given on Saturday last at the Holborn Hall, Gray's-inn-road, by the Associated Singers on behalf of this well-known printers' institution. Over fifty of the most popular of the music hall and concert artists at present performing in London appeared, and so great was the attendance that a second concert had to be organised and was run simultaneously with the principal concert. Mr. C. W. Bowerman, M.P., presided, and was supported by a number of well-known trade union officials connected with the printing industry, as well as by a number of other gentlemen. Mr. Ruben Henry, Mr. Harry Proctor, Mr. J. Fewster (who was justly proud of the performance of his singers), Mr. Arthur O'Connor, and others all worked well towards making the concert the great success it was, and the financial success should be exceedingly gratifying to the Printers' Medical Aid and Sanatoria Association, which is claimed to be one of the most up-to-date organisations in the metropolis. The Printers' Medical Aid Association First Aid Classes are exceedingly well supported, over 40 members having entered for the First Course. Dr. Cantlie is the lecturer, and appears to be very pleased with the enthusiasm of the members. These classes will be held from Monday next onward at the offices of the Correctors of the Press, 83, Farringdon-street, E.C.

WE regret to record the death of Mr. Frederick Ryan, a Dublin journalist. He had been editor of the *National Democrat*; the *Egyptian Standard*; and *Egypt*, the organ of the Egyptian Committee.

TENDERS ACCEPTED.—For the printing of a new edition of the official guide to Bath, for the Bath Corporation: W. Lewis and Son, Northgate-street, Bath. For printing for year for the Uxbridge Urban District Council: Lucy and Birch, Uxbridge. For supply of stationery, printing, and account books for one year for the Abergavenny Corporation: Morgan and Co., Abergavenny. For the printing and supply of stationery, for the Middlesex County Council: Waterlow Sons and Layton, stationery; Harrison and Sons, printing. For printing and folding the map of the tramways, for the London County Council: Johnson, Riddle and Co., Ltd., Southwark-bridge-road, S.E. For a supply of books to the Great Yarmouth libraries for 12 months: C. A. Campling, Ltd. For the supply of books and printing, for the Tramways Committee: Godfrey and Bartlett, Chapel-street, Exeter; Burridge and Cannicott, Musgrave-alley, Exeter; W. Chudley and Son, South-street, Exeter. For the supply of printing and stationery, for the Kingston Board of Guardians: Bull and Co., Surbiton, and Guilford and Co., Kingston. For the Glasgow Corporation, tramway tickets: Bell Punch and Printing Co., Ltd. (17,785,500 tickets per annum). For the supply of printing, stationery, etc., to the Maidstone Town Council; printing, W. P. Dickinson; stationery, Vivish and Baker; account books, W. Searles.

QUADS.

[We do not necessarily identify ourselves with any opinions of our contributor. At the same time, readers will not need to be assured that he always endeavours to communicate something worthy of attention.]

"I hold every man a debtor to his profession, from the which, as men do of course seek to receive countenance and profit, so ought they of duty to endeavour themselves by way of amends to be a help and an ornament thereunto."
FRANCIS BACON, Baron Verulam.

Since I last wrote "Quads" I have in one week been hobnobbing delightfully with printers in Edinburgh, in Newcastle-on-Tyne, in London, in a large town in the home counties, and in Cardiff, and have much I could tell and little time to tell it.

o o o

The Newcastle Costing meeting was on the whole the best. It took place in a lecture theatre. There Mr. Hazell, who was alone as spokesman on that occasion, had his audience in tiers—though it is not emotionalism, but lucidity and a certain sly humour which make him the exceptionally able speaker the craft has found him to be.

o o o

The "Lit and Phil" is the current name for the Literary and Philosophical Institute; and its lecture theatre was splendidly adapted for the purpose. Mr. Blaikie had to worry the Scottish printers to come a little closer to the platform. Their magnificent meeting place, the new Freemasons' Hall, was just a bit too large.

o o o

After hours of Costing, I did think, when passing the Cathedral at Newcastle on Wednesday midday that I would slip in, and forget all about printing and printers, save in their character as "miserable sinners." I sat

Digitized by Google

down serenely and complacently enough, but——

o o o

Right in front of me, pasted on to the flat ledge, that there might be no escape, I read—and I saw that every sitter was doomed to read:—

o o o

"The cost of maintaining the service of this sanctuary exceeds the revenue by £350 per annum." It brought you all back at one bound. And sent me out of the Cathedral at another bound.

o o o

The Newcastle and district men easily made the record in the number of questions they shot in. In regard to attention there was nothing between the three audiences. In each case they have paid the exponents that best of compliments implied in a perfectly quiet hearing, and have given the speakers a lusty round of cheers at the close. There was certainly all the heartiness we associate with the north country in the ovation to Mr. Hazell at the end of the Newcastle Congress.

o o o

Other journey topics I hope to treat later.

o o o

I see that to adequately deal with the forthcoming Kinematograph Exhibition at Olympia, thr proprietors of the *Kinematograph Weekly* have decided to publish a daily issue of their journal. Issued under the title of the *Kinematograph Daily*, the paper will contain full and specially illustrated reports of each day's doings, and will consist of 48 pages and cover.

o o o

Apropos of this Kinema topic, I may say that red and green only are the colours used in Kinemacolour. As I am at present informed—quite likely as experiments continue, the method of to-day may be out of date to-morrow. Probably it is generally assumed that three colours are employed.

o o o

I see that Mr. H. Bonham, of Messrs. Bonham, Scott and Co., Glasgow, lecturing on "Should we encourage the importation of foreign-built printing machinery?" in the Heriot-Watt College, Edinburgh, says that no tariff is wanted against foreign-made machines. All outside competition of the kind would be met if customers would frankly and clearly state their requirements and give makers an opportunity of showing the superiority of British machines.

o o o

After comparing British and foreign machines, Mr. Bonham said he believed the best printing machines in the world were still built in British workshops.

o o o

All the principal railways have given notice of certain increased charges from March 25th. The first series of charges to receive their attention are those relating to storage, warehousing, and split deliveries.

o o o

One of the items of increase relates to minimum charges, and another which will be felt very seriously is a scale of minimum charges for split deliveries. Apparently every delivery from a whole consignment of goods will be charged with a certain minimum sum in adtion to the regular charge for carriage and delivery.

o o o

As a *Newspaper Owner* correspondent points out, it has been quite a custom for large consignments of paper to be sent up from the mills at minimum charges, and when they have arrived in London for the railway company which has brought them to receive instructions for splitting the consignment up into a number of deliveries.

o o o

Dr. Max Coque, the distinguished specialist, so well known as Principal of the British Optical Institute and as writer and lecturer on matters connected with optics, has lectured upon "The production of light by living beings."

o o o

That might seem an unpromising heading so far as these columns are concerned, however interesting might be the survey of the photogenic organisms, and miscellaneous luminescent or fluorescent effects noted in the discourse. I find, however, that we are not left without some quite pertinent comments.

o o o

Dr. Coque (as reported in the *Optician*) led up to the notes which I propose to embody by some references to some wonderful carnivorous fish, denizens of the deepest ocean, who find their prey in those regions wholly unreached by sunlight through carrying lamps of their own.

o o o

The Malocosteus niger, a small black fish, brought up from a depth of some 4,500 feet, has two light-projecting organs below its eyes, which probably illuminate its path through the dark ocean as the lamp of a motor illuminates the road.

o o o

But by far the most striking of these light-bearing creatures is a carnivorous and formidable little fish, called Stomias boa. From its elaborately carved jaws to the extremity of its body, it has on either side, below the middle line of the body, a double row of lamps or luminous holes, so close together that the luminous plates must light up the water round it far more brightly than the lights of a steamer illuminate the surface waters.

o o o

It must look like a brilliantly-lighted submarine train.

o o o

On the whole, the researches of Raphael Dubois have, says Dr, Coque, fully justified the conclusion he had drawn as far back as 1886, namely, that whilst in the case of the best artificial llght 98 per cent. of the energy spent is used to manufacture invisible radiations, especially calorific, and but 2 per cent. are used to produce light, in the case of physiologic light, 98 per cent. of the total radiations is made of visible light and 2 per cent. only is lost.

o o o

Besides this immense economic superiority, we have also to consider the exceptional qualities owing to which the pyrophores themselves prefer their own light to any other. This light cannot be put out by wind or rain, and with it the danger of fire is eliminated.

o o o

It must be understood that these little lanterns which the pyrophores always carry with them, which are always available, do not involve a great physiological expenditure. Twenty pyrophores, after having shone many hours, during a period of three days and three nights, had only lost a weight of little over half a gramme, which represents a loss of three centigrammes, or half a grain per insect, and during that period they had spent more energy in movements than in producing light; moreover, they had not consumed any food.

o o o

Mr. Guillaume has tried to find approximately the photogenic efficiency of the electric arc lamp, and has found it to be 1/40; that is, only the 40th part of the energy spent to excite the lamp is utilised to give light.

o o o

The practical efficiency is still lowered if we take into consideration the amount of energy corresponding to the weight of combustibles spent to work the machinery supplying the current, and if we estimate the loss resulting from the different transformations of energy involved.

o o o

Looking at the question from this point of view, Guillaume has drawn the following table, giving the relative efficiency of different sources of light:—

Pyrophore...	1 0
Sun	0·14
Arc lamp	0·0025
Incandescent electric lamp	0 0005
Candle	0·00014

o o o

As we see by this, the production of non-luminous radiations is dear, and besides, from the point of view of illumination, the ultra-violet radiations are always harmful and the dark calorific radiations very often are.

o o o

The physiologic light is produced without the simultaneous production of heat.

o o o

The practical meaning of the superiority of physiologic light will be emphasised when it is stated that in Great Britain the sum spent annually in manufacturing light reaches, according to Prof. Silvanus Thompson, the gigantic total of from ten to twenty million pounds. Now, at least 99 per cent. of this enormous amount is thrown away in producing heat.

o o o

It is strikingly obvious that there is room for future development, although again quoting Silvanus Thompson, "the cheapest source of light still remains the commonest and most universal, the light of the sun, which shines alike on rich and poor and gives us a light the dominant wave-length of which is just that wave-length to which our eyes have become, in the long evolution of the ages, the most sensitive."

o o o

"By no artificial process can we manufacture light so cheaply that it would not be still cheaper to adjust our social habits to the hours of sunlight and do our day's work while it is yet day."

Frank Colebrook.

Special Prepaid Advertisements.

IT IS IMPORTANT that Advertisements under any of the Headings mentioned below should reach us by the first post on Wednesday to insure insertion the following day.

SITUATIONS.—Charges for Advertisements under the headings "Situations Vacant," or "Situations Wanted," are at the rate of

ONE SHILLING FOR 24 WORDS
(3 Insertions: TWO SHILLINGS),

and Fourpence for each additional Eight Words. Minimum Charge, One Shilling.

BUSINESSES FOR SALE or WANTED, MACHINERY WANTED or FOR SALE, SALES BY AUCTION, TENDERS, PUBLIC APPOINTMENTS, MISCELLANEOUS—One Penny per Word.

PAYMENTS must be made in advance, except where the Advertiser has a running account, in which case the cost can be debited thereto.

ADVERTISERS, by paying an extra fee of Sixpence, can have the replies addressed to the "British and Colonial Printer and Stationer" Office under a number, and such replies will then be forwarded post free.

STONHILL & GILLIS, 58, Shoe Lane, London, E.C

Situations Vacant.

TRAVELLER wanted, with practical knowledge of Trade, to represent firm of Commercial Printers.—Garside and Jolley, Warrington. 13194

Situations Wanted.

OVERSEER or WORKING FOREMAN, Jobbing and News, disengaged; good disciplinarian; excellent references.—R. M., 15, Lalehamroad, Catford. 13163

Machinery and Plant for Sale.

ALL ELECTROTYPERS and STEREOTYPERS should write H. Williams and Co. for their latest catalogue of machinery, and Electroline Enamel Paste, for producing fine art stereos. —Engineers, Red Lion Works, Warner-street, Rosebery-avenue, E.C. 12343

Miscellaneous.

SMALL LIGHT FACTORY.—For immediate disposal, a fully-equipped Factory now used for Printing Picture Post Cards; suitable for this, or for General or Music Printer; excellent Well, Electric Light and Gas laid on; Low Rent and Rates, Cheap Labour; two-and-a-half years' Agreement; option to acquire Freehold; 18 miles from London; 5 minutes from London and North-Western Railway Station; Machinery can be acquired at a valuation, or will be removed.—Full particulars. Vandercom and Co., 23, Bush-lane, London, E.C. 13195

TO PRINTERS, PUBLISHERS and ALLIED TRADES.—TO BE LET, as a whole or in Sections, an important Block of Buildings covering an Island Site conveniently situated close to Fleet Street. They contain four well-lighted upper rooms with lofty basement. Total floor space, 12,625 sq. ft.—Rent and further particulars of Messrs. Farebrother, Ellis and Co., 29, Fleet-street, E.C. 13181

The Co-Partnership Bill.

THE idea of admitting the workers of a firm to a share in the annual profits has often been put forth as the only remedy for strikes and other labour disputes, while at the same time it ensures that the workers are having a financial recompense in proportion to the efforts they make to increase the prosperity of their employer's business. Several firms in the printing and allied trades have already adopted the co-partnership principle with success, and now a bill has has been introduced to the House of Commons that is intended to encourage the further development of co-partnership methods in the industrial life of the country. Its objects are to enable companies to adopt co-partnership in cases where they would otherwise be debarred from doing so by Acts of Parliament or articles of association, and to set out in the form of a schedule a model scheme of co-partnership for their voluntary adoption. The Bill also provides that such model scheme shall ordinarily be a condition for granting statutory power to new companies to raise capital. Under this scheme certificates of partnership in the company and a share in its surplus profits are to be granted to all persons in its regular employment. It is provided that the standard rates of wages shall be taken to correspond with a standard return of 5 per cent. on all paid-up capital, and when the return is higher than 5 per cent. the employee becomes entitled to a bonus calculated at one-twentieth of his existing wages for every extra 1 per cent. paid in dividend. Thus a company with a paid-up capital of £100,000 and a normal wage bill of £20,000 would, if it paid 6 per cent., have to give its employees an extra £1,000, or £21,000 in all; if it paid 10 per cent. £25,000, and if it paid 15 per cent. £30,000. Similarly a workman with a standard wages of 30s. a week would get 31s. 6d. on a dividend of 6 per cent., 37s. 6d. on a dividend of 10 per cent., and 45s. on a dividend of 15 per cent. As, however, it is not desirable that the whole bonus should be paid over in cash, it is provided that trustees shall be appointed to whom at least half the bonus shall be paid, and by whom it shall be invested, if possible, in the shares of the company itself. It is also provided that in the case of registered companies the Board of Trade may allow other regulations to be substituted in individual instances, and may allow a lower rates of bonus when salaries and wages bear a specially high proportion of the annual cost of the business of the company. Other clauses of the Bill provide for the working of the schemes, and for the appointment of directors, trustees, etc.

* * *

American Developments and British Trade.

THERE is every indication that the trade of Great Britain will be considerably influenced by recent developments in the United States of America, and in this paper and print will of course share. On the one hand there is the opening of the Panama Canal for the passage of the vessels of commerce, which is promised before the end of the present year, and will open new channels of competition for the British manufacturer; while on the other hand there is the Tariff Revision Bill, presented in the American House of Representatives on Monday, by which several British industries stand to benefit. The latter development has a direct bearing on the industries we represent. The Bill provides for sweeping cuts in nearly every schedule of the Payne-Aldrich Tariff, which has been in force since 1909. The free list is very greatly extended, and its additions include typesetting machines, printing paper (formerly bearing a duty of three to eight-tenths of a cent per pound, wood pulp, Bibles, and typewriters. Printing paper, the cost of production of which is low in this country, where it can be made under as favourable conditions as anywhere in the world, is transferred to the free list when its price is less than 2½c. a pound, while the higher grades are given a tariff of 12 per cent. in place of 15.80. Copying paper is cut down from 42.32 to 30; bag envelopes, etc., from 49.92 to 35; parchment papers from 47.92 to 35; photographic paper from 28.99 to 25; writing paper from 45.73 to 25; common wrapping paper from 35 to 25, and books from 25 to 15, while the duties on printing presses and machine tools are halved. To encourage trade with foreign countries the Bill will reverse the maximum and minimum provision of the present law. The new rates will be the maximum tariff. The President is authorised to negotiate reciprocity treaties and to make concessions to countries granting favours to American exports. The rates proposed in the Bill, however, are not sure of enactment in their present form.

* * *

Newspaper Competitions.

NEWSPAPER competitions for the purpose of enlarging the circulation of a journal or bringing it more directly before a certain section of the public, must be deprecated as un-English, and against the principles of English journalism, which are admired and appreciated by every foreign nation in the civilised world. The word solution competitions for prizes and money rewards are a danger morally and otherwise to the nation as a whole, and the quicker legislation is introduced on the matter, the more satisfied will newspaper owners who conduct their journals on straightforward lines become. The Lancashire Newspaper Society recently passed some very strong resolutions against newspaper competitions, and one stated: "That it is detrimental to public morals that

Digitized by Google

such large sums of money as £5 per week for life, £3 per week for life, and £1,000 and £500 cash prizes should be awarded for efforts in no degree commensurate with the labour involved or the intellect demanded." A copy of this resolution has been forwarded to the Prime Minister, and we hope it will not be pigeon-holed as irrelevant to the present business or procedure of the Government. These competitions are a growing menace to fair competition in the newspaper world, and for these reasons proprietors who are totally opposed to increasing circulations through such a *modus operandi* should spare no effort in trying to direct public attention against the modern system adopted, and agitate for legislation.

The Printing Crafts Guild.

"Recent Developments in Printing Machinery," was the title of a lecture delivered by Mr. F. W. Wright, at the School of Technology, Manchester, on Saturday last, and in his two hours delivery he explained thoroughly the Linotype and Machinery Offset Press, and the Miehle Press which is now constructed so that it is capable of doing the heaviest and finest class of work. Mr. J. C. B. Percy, President, Manchester and Salford Master Printers' Association, made a capable chairman, and in his remarks advocated the coming printer getting out of the crowd at the bottom and climbing the ladder of success. It was surprising how few thoroughly knew that branch of the trade to which they had served an apprenticeship, yet if queried upon the latest football results, they could gather their scattered thoughts and give details as to who was captain, full-back, or any other part of a team. Employers were looking out for good capable men, and willing to help from a monetary or other point of view that would assist the enthusiast to make himself master of his craft or calling. He took it that the sixty persons who were present at that meeting intended making progress, seeing there were so many football finals and other attractions, not forgetting the glorious spring afternoon. The President, Mr. R. B. Fishenden, also spoke.

On May 3rd next the members, by the kindness of Messrs. Linotype and Machinery Ltd., will visit the works at Broadheath and inspect the latest developments in printing machinery.

Wee Macgreegor.

IF THE MIEHLE WAS NOT SOMETHING MORE THAN A TWO-REVOLUTION PRESS IT WOULD NEVER HAVE REACHED THE PROUD POSITION IT HOLDS TO-DAY IN THE ESTIMATION OF EVERY PRACTICAL PRINTER

It is because it is *the* two-revolution press that the trade buys it.

Design, material, workmanship- all combine to make and keep it the premier machine.

It is built at the Broadheath Works—in itself a guarantee of efficiency.

The Miehle TRADE MARK

is Manufactured and Sold by

Financial.

Offices of the *British and Colonial Printer and Stationer*,
58, Shoe Lane, London, E.C.
Wednesday, April 9th, 1913.

CREDIT has remained in comfortable supply throughout the past week, with rates on the easy side. Discount rates have given way, but were steadier yesterday. Liverpool Corporation Bills amounting to £250,000 of six months' currency were tendered for at the Bank of England, and applications amounted to £675,000, the average rate being £3 17s. 9.75d. per cent. Bullion movements have resulted to date in a net influx of £889,000. Stock markets have been troubled again with the political uncertainty and business has been very dull. Favourable rumours in regard to Eastern affairs rallied markets last evening after a weak opening, and Consols regained the ground they lost earlier, but the quotations are lower than a week ago, viz., 73 1/16 to 74 1/16 for money, and 74 1/8 to 74 1/4 for the May account.

The miscellaneous industrial market has been very quiet this week, the volume of business in progress continuing small. A rather firmer tone was in evidence yesterday, the result of the better feeling in other markets. Movements have taken place both ways in our list of printing, newspaper and publishing shares. Carl Hentschel (1906), Ord. are down 1/8 to 1/8–3/8, and the Pref. have fallen 1/8 to 3/8–5/8; Ilford Ord. are up 1/32 to 7/8–1; International Linotype have risen 2 to 79–84, and Linotype and Machinery B Deb. have dropped 1 to 44–49. Business has been done during the past seven days in Amalgamated Press Pref. at 20s. 6d., 20s. 7½d., and 21s. 3d.; in Associated Newspapers Pref. at 21s., 20s. 9d., and 20s. 9d.; in Cassell and Co. at 95s. and 98s. 9d.; in *Financial News* Pref. at 15s. 7½d. and 15s.; in Ilford Pref. at 19s. 3d. and 19s. 3d.; in *Illustrated London News* and *Sketch* Deb. at 63; in International Linotype at 82 and 84; in Edward Lloyd Pref. at 22s. 3d.xd. and 22s. 3d.xd.; in George Newnes Pref. at 15s., 14s. 9d., 15s. 3d. and 15s.; in Weldons Ord. at 31s. 6d. and 31s. 10½d.

DIVIDENDS AND REPORTS.

SPORTING TIMES.

The directors of the *Sporting Times* Company, Ltd., have declared a dividend at the rate of 2 per cent. per annum on its issued ordinary capital for the half-year ended December 31st, 1912.

COMPANY MORTGAGES AND CHARGES.

Fresh Obligations registered pursuant to Section 10 of the Companies Act, 1907, and Satisfaction registered pursuant to Section 16 of the Companies Act, 1900. (The registration of Satisfaction is not compulsory.)

Carbon Paper Supply Co., Ltd.—Particulars of £1,500 debentures, created March 20th, 1913, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the amount of the present issue being £575. Property charged, the company's undertaking and property, present and future, including uncalled capital. No trustees.

Standard Catalogue Publishing Co., Ltd.—Issue on March 19th, 1913, of £250 debentures, part of a series of which particulars have already been filed.

National Weekly, Ltd.—Particulars of £750 debentures, created March 14th, 1913, filed pursuant to Section 93 (3) of the Companies' (Consolidation) Act, 1908, the whole amount being now issued. Property charged, the company's undertaking and property, present and future, including uncalled capital. No trustees.

Sears Printing and Publishing Co., Ltd.—Mortgage dated March 12th, 1913, to secure £100 and further advances (stamped to cover £700), charged on certain book debts. Holders—Atkins and Bott, Ltd., 1, Guildhall-chambers, E.C.

Horace Barnes and Foster Wickens, Ltd.—Issue on February 17th, 1913, of £200 debentures, part of a series of which particulars have already been filed.

Woodgate Press, Ltd.—Debenture dated March 21st, 1913, to secure £100, charged on the company's undertaking and property, present and future, including uncalled capital. Holder—Mrs. J. Corke, 33, Wilsons-road, Hammersmith.

County Gentleman Publishing Co., Ltd.—Debenture dated March 17th, 1913, to secure £1,000, charged on the company's undertaking and property, present and future, including uncalled capital, subject to prior debentures. Holder—M. Greenshields, 3, Buckingham-gate, S.W.

Empire Paste Co., Ltd.—Debenture dated March 13th, 1913, to secure £125, charged on the company's undertaking and property, present and future, including uncalled capital. Holder—Miss J. Kirkaldy, St. Abbs, Wimbledon.

E. W. Morley, Ltd.—Particulars of £200 debentures, created February 27th, 1913, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged—The company's property, present and future, including uncalled capital. No trustees.

John Harrley, Ltd.—Memoranda of satisfaction in full (a) on February 28th, 1912, of debentures dated October 10th, 1906, securing £50; (b) on September 30th, 1912, of debentures dated July 8th, 1904, securing £100; (c) on February 11th, 1913, of debentures dated September 9th, 1904, securing £50; and (d) on September 30th, 1912, of debentures dated October 12th, 1906, securing £100, has been filed.

Corrugated Packing Materials Co., Ltd.—Debenture dated March 12th, 1913, to secure £1,000, charged on the company's undertaking and property, present and future, including uncalled capital, if any. Holder—J. Smalley, West Oxford-street, Ashton-under-Lyne.

Bowerman's Press, Ltd.—Issue on March 17th, 1913, of £500 debentures, part of a series of which particulars have already been filed

National Envelope Co., Ltd.—Issue on March 19th, 1913, of £500 debentures, part of series of which particulars have already been filed.

COMPANY NOTICES.

"DERBYSHIRE COURIER," Ltd.

At a meeting of the company, held at Chesterfield, on March 7th, the following resolutions were passed; and at a subsequent meeting, on March 28th, were duly confirmed:—"That the company be wound up voluntarily." "That Mr. Samuel Edward Short, of 17, Glumangate, Chesterfield, be appointed liquidator for the purpose of such winding-up." Notice is given, that a meeting of the creditors of the company will be held at Chesterfield, on April 15th.

COMMERCIAL INTELLIGENCE.

ANGLO-RUSSIAN GAZETTE (1911), Ltd.
Newspaper and Picture.

A compulsory winding-up order having been made against this company, which carried on business at Salisbury House, London, E.C., the statutory first meetings of the creditors and shareholders were held last week at the Board of Trade Offices, Carey-street, Lincoln's Inn, W.C. Mr. H. E. Burgess, official receiver, reported that the company was incorporated in September, 1911, to carry on business as newspaper proprietors, and they took over the proprietary rights in the *Anglo-Russian Gazette*. The paper had never been a financial success, the circulation having been very small throughout. Outside the business of the paper an arrangement was entered into for the acquisition of a valuable picture. In November, 1911, Mr. Dmitre

Tchernine was appointed managing director of the company, and in January last negotiated on behalf of the company for the purchase of "La Madonna della Quercia," a picture stated to have been painted by Raphael. The purchase price was to be £40,000, for which the company gave bills of exchange. Elaborate arrangements were made for the exhibition of the picture at a hotel in the Strand, and a copy of the paper was got out in which the picture was shown to be genuine by comparison with another picture on the subject already in existence. Considerable expenses were incurred over the publication of those illustrations, and unfortunately when they had received some considerable amount of publicity a check arose owing to an action started by four Italian gentlemen who claimed to be the owners of the picture. As a consequence of that action the picture was taken away from the hotel and was now housed in the Chancery-lane Safe Deposit under an order of the Court. Owing to the stoppage of the exhibition of the picture, the company had had no opportunity of redeeming the bills, apart from which they owed about £3,000. The trial of the action had been adjourned until after the appointment of a liquidator under the winding-up order. The printer of the *Anglo-Russian Gazette* drew the attention of the official receiver to a contract made with the company for the reproduction of the picture and the placing of 5,000 copies for issue to the public. He asserted that there should still be some considerable profit coming to the company from that contract, and complained that he was induced to continue the printing of the paper by the promise of a lien to be given him upon that contract. He understood, now, that the contract had been relinquished by the managing director in consideration of a payment of £200, one half of which had been paid away in respect of law costs. The chairman intimated that the matter would be thoroughly investigated by the liquidator in due course. A resolution was passed for Mr. Wm. Peet, chartered accountant, Queen Victoria-street, E.C., to act as liquidator, with the assistance of a committee of inspection consisting of Mr. Harris, Mr. Lacey and Miss Livingstone.

Re DAVIES and ALLEN, Printers and Stationers.

Under a receiving order made on their own petition against Ernest Bonner Arthur Allen, and Martin James Allen, trading in partnership as above at 91, Chertsey-road, and Duke-street, Woking, the first meeting of creditors was held recently, at the London Bankruptcy Court, before Mr. W. J. Savill, official receiver for Guildford. Having called over the proofs of debt, the chairman reported that the statement of affairs had not yet been completed; it was rather mixed up with the failure of Messrs. Drowley and Co., builders in the neighbourhood, the debtor Allen being a partner in both firms. The unsecured liabilities of this estate were returned at £1,390 14s. 2d., and there were preferential claims of £30 19s. 4d., making a total indebtedness of £1,421 13s. 6d. The assets comprised cash in hand, £15 10s.; stock-in-trade, £300 (cost, £1,040); machinery, £400 (cost, £1,000); trade fixtures, £25; office furniture, £15; and book debts, £427 15s. The deficiency was estimated at £177 4s. 7d. The separate estate accounts of M. J. Allen disclosed liabilities £60 and assets consisting of an established surplus of £115 from securities held by fully-secured creditors, thus showing a balance of £55 which was carried to the joint estate as an asset thereof. The business was commenced ten years ago by Mr. John Drowley and Mr. John Davies. Mr. Drowley went out in September, 1905, when the debtors Allen joined as partners. Mr. Davies retired in 1908 or 1909, receiving £80 for his share of the business which had since been continued by the debtors, who attributed the failure to bad trade, shortness of capital, and loss sustained through the Duke-street premises. In reply to the chairman, the senior debtor said he was not prepared to submit an offer to the creditors at present, but thought if they were to be allowed to run on for a time, they could make some suitable arrangement under which a small company would be formed to take over and conduct the business. The chairman remarked that a trustee in bankruptcy would be a better man to make an arrangement of that character. The debtors accordingly consented to an order of adjudication, and a resolution was passed for Mr. G. M. White (Francis, Nicholls, White and Co.), C.A., 14, Old Jewry Chambers, E.C., to act as trustee, with the assistance of the following committee of inspection, viz., Mr. Dickinson (John Dickinson and Co., Ltd.), Mr. Alfred Best (Cropper, Charlton and Co.), and Mr. E. D. Hanson (Stephenson, Blake and Co.). The chairman reported that Mr. Thos. Bayne had been acting as special manager since the making of the receiving order, with a view to the sale of the business as a going concern. A resolution was passed confirming the appointment at a salary of £2 2s. a week, and Mr. White was requested to give security in a bond of £800. A question arose as to the ownership of a Wharfedale cylinder printing machine and a Demy-Wharfedale machine purchased by the debtor under hiring agreements at the prices of £170 and £95 respectively, and upon which £30 and £60 were now owing. The debtor said he had included the machines in the assets in the statement of affairs, but he could not find a copy of the agreements, and was not clear as to the position. The chairman observed that the trustee would have to deal with the matter in due course, and the meeting then separated. The public examination of the debtors is appointed to be held on May 6th, at the Guildhall, Guildfofd. Appended is a list of the principal creditors, viz.:—

Re WILLIAM COLLINS, Stationer, etc.

An application for an order of discharge was made last week, to Mr. Registrar Hope, at the London Bankruptcy Court on behalf of this bankrupt, who carried on business at 2, Beulah-road, Walthamstow. Mr. W. P. Bowyer, official receiver, reported that the applicant filed his petition in March, 1905, with unsecured liabilities £143 9s. 3d., and assets that had realised £18 12s. 3d. In September, 1895, the bankrupt, in partnership with another person, purchased the business for £40. The partner retired in 1898, and the bankrupt continued the business alone until March, 1905, when the stock and effects were sold under a distress for rent. The failure was attributed to the trade expenses having exceeded the gross profits, owing to bad trade and to deterioration of the neighbourhood. The offences reported by the official receiver were (1) insufficiency of assets to equal 10s. in the £ on the amount of the unsecured liabilities; (2) omission to keep proper books of accounts; and (3) trading with knowledge of insolvency. His Honour upheld the report, and imposed a further suspension of two years. Order entered accordingly.

Re ERNEST F. H. TUCKER, Watchmaker, Stationer and Printer.

At a sitting of the Portsmouth Bankruptcy Court, last week, before Registrar Renny, this debtor who carried on business at High-street, Titchfield, came up for examination. The gross liabilities were £69 13s. 4d., of which £60 8s. 10d. were expected to rank, and the assets amounting to £27 18s. 3d., there was a deficiency of £32 10s. 7d. "A serious illness about five years ago, and the loss of my wife at the same time, another illness about two years ago, when I was unable to attend to my business for four months, and competition during the last 18 months," were the causes of failure alleged by debtor. Debtor first became aware of his insolvency about four months ago, and had since contracted a few small debts, for the payment of which he relied upon the Christmas trade, which proved a failure. He estimated his household expenses for the past 12 months at £65, and the profit of the business was estimated at £32 9s. 5d., and the difference represented the deficiency. Under examination by the official receiver, debtor stated that he was also a greengrocer, and the registrar remarked that the business had been a curious combination. Debtor explained that his trade was a watchmaker, and he carried on a business in Forton-road, Gosport, for 14 or 15 years. The examination was closed.

In the National Printing, Publishing, Advertising and Allied Trades Exposition, which will open in New York on April 19th, there will be copies of the *Peking Gazette*, the oldest newspaper in the world, news letters in cuneiform characters on clay that were dug from the ruins of Persepolis; there will be books printed by Gutenberg and Caxton, and there will be shown every type of press from the handpress of Gutenberg's time to the last word in the huge intricate presses of to-day. An interesting feature will be the reproduction of the little offices where Franklin, Greeley, and Mark Twain learned to set type, and these offices will be fitted out with the kinds of type they used to set.

A WORD OF CAUTION.

In giving the official Gazette information, it must be distinctly understood that we take official records as we find them, and accept no responsibility for inaccuracies, while, as an almost invariable rule, the facts will be found correct. We advise our readers, before forming hasty judgment, to consider that there may be in each case a satisfactory explanation which does not appear on the records.—Ed.]

ENGLAND AND WALES.

PARTNERSHIP DISSOLVED.

CHADWICK, J. W., and TATTERSALL, E. L., trading as J. and W. Chadwick, 4, Thornton-road, Bradford, Christmas card publishers, printers and stationers. Debts by J. W. Chadwick, who will in future carry on the business on his own account. February 28th.

Paper and Pulp Makers' Directory

OF

SWEDEN, NORWAY, DENMARK, and FINLAND.

ENGLISH EDITION.

Edited by HUGO BRUSEWITZ
(Thirteenth Annual Issue.)

COMPLETE. RELIABLE. UP-TO-DATE.

Contains an Alphabetical List of all of the Scandinavian Paper and Pulp Mills, with full particulars of class of pulp or paper made, trade marks, and other details of interest to all who have business relations with these industries. A map showing the locality of the mills is included in the Directory.

8vo., 150 pp., cloth, price 7s. 6d. net. Postage, 4d. extra.

TO ADVERTISERS

The Fourteenth Edition (1913) of this well-known work will shortly be put in hand, and orders for advertisements may now be sent to the British Agents, as under. The scale of charges, which includes a free copy of the Directory and Map, is :—

	English Edition only. £ s. d.	English and Swedish Editions. £ s. d.
Page (6¼ by 3¾ inches)	4 0 0	6 0 0

Printers' Wages in the U.S.

As showing the difference that exists between the wages paid in this country and those in the United States, it may be interesting to reprint the following report from our American contemporary, the *Editor and Publisher*:—

The old newspaper and job scales having expired March 1st, the local Typographical Union of Louisville, Ky., has asked for a new job scale of $18, with 50 cents more every six months for three years, which will bring the scale up to $21. The newspaper scale for afternoon papers provides for an increase from $22.50 to $24.60 and for morning papers from $24.96 to $27.

Under the new scale adopted at Harrisburg, Pa., hand men now receive $17.25, a rise of $2.25 per week. Only one newspaper at Fort Collins, Colo., the *Courier*, has accepted the new scale. The new scale of wages is as follows:—Under a five-year contract foremen are to receive $25, machine operators $25, floormen $20.

The local Typographical Union of Alliance, O., has secured the adoption of a new scale, raising the pay of the job and "ad" men from $12 to $15 per week, machine operators from $15 to $18 and foremen from $16 to $19, Overtime will be a price and one-third. At the end of one year "ad" and job compositors will receive $16 per week.

Akron, O., Typographical Union has secured the adoption of a new scale which provides for an increase of from $2 to $2.50 in the wages of its members.

Hamilton, Ont., printers have closed a contract with publishers calling for an increase in the book and job scale of $3 a week at the end of the third year under a five-year contract. The pay for hand compositors is increased from $16 to $18, to be in force for two years, $18.50 for the third year and then $19 per week. The pay of machine operators is advanced to $20.50 during 1913, to $21 during 1914, to $22 during 1915, to $22.50 during 1916, and then to $23 per week. The old scale was $18.

The new scale which goes into effect in Bismark, N.D., provides for an increase of $2.50 per week for floormen and 90 cents for machine men, making a flat scale for day work of $22.50; night work, $25; foremen receiving $25 and $27, respectively.

A new three-year agreement has been reached by the Peterborough Typographical Union and the employing printers of that city. The new scale went into effect February 1st. Hand compositors and floormen receive $15 per week in 1913, $16 in 1914, $17 in 1915; foremen $17 per week in 1913, $18 in 1914, $19 in 1915. Machine operators $17 per week in 1913, $18 in 1914 and 1915. All night work $2 additional. The old scale is $14 for hand compositors and $17 for linotype operators.

The Hearst newspapers of Chicago and Mailers' Union No. 2 have agreed on a contract for three years beginning February 17th, 1913, under which the day foreman receives $30 a week; night, $35; journeymen $19.50 per week of forty-eight hours on the *American*, the afternoon paper, and $18 per week for thirty-six hours on the morning paper, the *Examiner*. All overtime 50 cents per hour. Extra men to receive same scale as regulars, except for inserting Sunday supplements, when a scale of 40 cents per hour shall prevail day or night, except Saturday night, when they shall receive $3.50 for eight hours and 50 cents an hour thereafter. Saturday night work is $4 for eight hours, including thirty minutes' lunch time.

A new scale under a five-year contract has gone into effect at Yonkers, N.Y., which provides an increase for the first year of $1 a week for machine operators, $1.50 for job and floormen, $3 for machinist operators, $2 for newspaper foremen and $3 for job foremen. For the second and succeeding three years the increase is to be $1 per week all around.

Negotiations with the publishers of Lynn, Mass., newspapers have resulted in reducing the hours per week from forty-seven to forty-one. The wages remain at the old figure.

An increase of $1 per week has been secured by the printers of Winnipeg, Man., for work on newspapers, making the pay $29 for night and $26 for day work.

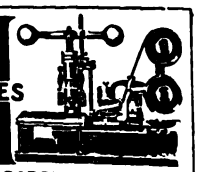
An increase of 50 cents per week has been secured by the Houghton, Mich., Typographical Union, under which the men on the morning papers will receive $22.50 per week and on evening papers $20.50, and $18.50 for book and job work.

The Pottsville, Pa., Typographical Union has secured the adoption of a scale calling for an increase of 50 cents per week for three years.

The Typographical Union of Stockton, Cal., has increased its scale $1.50 per week for every member. All employers have signed the agreement. The foremen on morning papers now get $33 per week for a three-machine office, or more, and $30 for less than that number. Foremen on evening papers receive $30.50 and $28.50 per week for offices having a similar capacity. Advertisement foremen will receive $30 and $27 per week for morning and evening papers, respectively. Machine operators get same pay as the advertisement foremen. Floor and advertisement men will receive $27 and $22.50 for day and night work, respectively.

The new scale adopted at Evansville, Ind., provides for a rise in wages from $24 to $25.50 for night work and from $22.50 to $24 for day work at the end of four years.

An increase of $1.50 per week under a three-year agreement has been secured for the members of the Woonsocket, R. I., Typographical Union.



The "Diamond" Screen Cabinets.

Every process engraver is aware of the importance of taking the greatest care of the expensive line screens that are used for half-tone reproduction, and so should welcome the new "Diamond" Cabinets that have been introduced by Messrs. F. E. Brown and Co., 5½, Guthlaxton-street, Leicester, and that are designed for the convenient storage of engravers' screens. These cabinets contain a number of compartments, each sufficient in height, depth and width to hold at least one screen, and this arrangement permits of any screen being withdrawn without disturbing the remainder of the contents. One great advantage of these cabinets over any ordinary cupboard is that by an ingenious arrangement of rollers in the base of each compartment the screens are "rolled" in or out, thereby avoiding friction on the edge of the screen and considerably prolonging its life. Another advantage is that the door of each cabinet is provided with a window which facilitates a quick inspection of the contents by the person responsible for their safety. The cabinets are well made and finished, and are provided with a good lock with duplicate keys. Five styles are made, capable of taking screens up to 18 by 15 inches in the smallest, and 30 by 24 inches in the largest sizes. A special cabinet that would fold flat for export is also made for the Colonial and foreign trade, and as an inducement to speedy ordering the firm offers to pay carriage on all orders in Great Britain received before May 1st next. Messrs. F. E. Brown and Co. are practical screen makers, and knowing exactly the requirements of the engraver, have built the "Diamond" Cabinets to meet them.

The "Montreal Herald."

The *Montreal Herald* has recently moved into a new fireproof building at Craig and St. Alexander streets. The structure covers an area of 12,000 square feet and has a frontage of eighty feet on Craig-street and 150 feet on St. Alexander-street. The total cost of land and building is over $350,000. The building consists of seven storeys and a high basement and is constructed of reinforced concrete. The façades are architecturally pleasing and the window spaces much larger in proportion to the wall area than is usual. The building is as nearly fireproof as can be made, and contains in addition a full supply of fire extinguishers and interior and exterior fire escapes. The lighting is effectively arranged and the elevator facilities are of the best. The *Herald* occupies the ground floor, with the mechanical departments in the rear of the building, this section being especially laid out to house the giant presses and mechanical apparatus of the paper. The *Herald*, in celebration of its centennial anniversary, printed an issue containing 122 pages, constituting one of the largest newspapers ever issued in Canada. The paper was started on October 12th, 1811. During the hundred years of its history the paper has had its ups and downs, its periods of prosperity and of stress, but its general course has been ever onward and upward. Few papers in Canada have greater prestige and influence than the *Herald*.

An American contemporary tells of a travelling salesman who recently struck town with a fine picture which he exhibited as a specimen of lithography of the early days. It was made in 1788, some years before lithography was discovered. When his attention was called to this fact he remarked: "That is what makes it so valuable. Anyone can get a lithograph that was made after lithography was discovered, but it takes an explorer to find one made before that time."

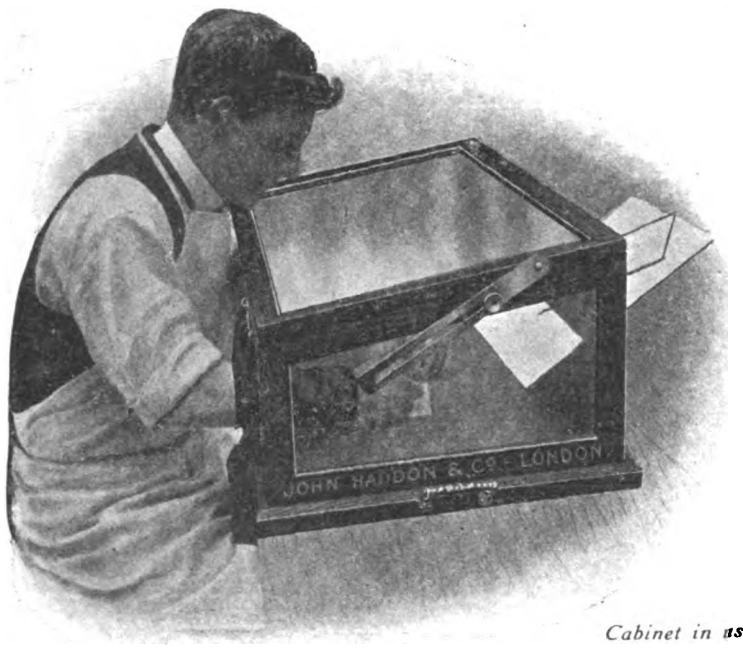
Safety Bronzing Cabinet

Patent No. 11291/10.

Cabinet Open, and showing Detachable Tray.

BEST QUALITY WORK
NO DANGER TO OPERATOR
NO WASTE OF BRONZE
INCREASED OUTPUT



THIS Bronzing Apparatus has been introduced to enable Bronze Powders, etc., to be applied by hand without any particles of powder floating about the room, or being inhaled by the operator.

It consists, as shown in the illustration, of a box fitted with hinged transparent top and transparent ends. The side nearest the operator has apertures fitted with flexible sleeves with springs to close round the wrists of the operator, so that, although his hands and arms are free to move inside the box, no powder can escape.

The bottom of box is perforated and allows the surplus powder to fall into a detachable tray underneath. The sheets or cards to be bronzed are fed direct from the platen into a narrow horizontal slit fitted with sloping feed board.

This apparatus is made throughout in our own Works, and the edges of the lid and detachable parts are made dustproof. There is no waste of bronze and no injury to the health of the operator, and nothing to wear out. The bronzing is executed immediately under the eyes of the operator, ensuring finest quality work.

JOHN HADDON & CO.
SALISBURY SQ.
FLEET STREET.
LONDON, E.C.

Cabinet in use.

This Cabinet is designed to cope with work up to and including Foolscap Folio in size **Price £3-3-0**

Other sizes to order at proportionate prices.

ACCEPTED BY H.M. FACTORY INSPECTORS. **FACTORY AND WORKSHOP ACT, 1901. This appliance complies with the instructions contained in this Act and which reads as follows: "Regulations 2.B. Appliances so constructed as to prevent as far as practicable the escape of dust into the air of any occupied room."**

In AMERICA

There is published only one weekly paper representative of the interests of employing printers. It is the most popular Printers' Paper read, because:

It is the only strictly Business Paper.
The only Newspaper.
The only Paper which holds the attention of the man who owns the Plant.
The PRINTING TRADE NEWS does not attempt to teach printers to set type, but it is the foremost authority on the latest efficiency methods, the organization activities, progress in cost system work, approved methods of printers' advertising and anything and everything that tends to make the printing business a pleasant and profitable one.

We have good mechanics. Let us have good business men. Let the NEWS come to YOU every week. Europe $5.00 per year; Canada $3.00. 64 Pages weekly.

The Testing of Paper.

Hints on Microscopical Works, Physical Tests and Chemical Analysis.*

It is a well recognised fact that an accurate knowledge as to the materials and chemicals entering into the composition of a paper is of great value to every papermaker who may be called upon to match a given sample. Manufacturers at present must depend on their personal judgment for such information, and the ability to correctly judge papers may only be acquired by long years of experience. To such an experienced man the first look at a particular sheet of paper reveals the general class to which it belongs, whether writing, printing, wrapping or board, etc. A second glance reveals the relative grade into which the particular class is subdivided. This preliminary information at once brings to the mind of the experienced man a picture of the general process of manufacture required to produce such a paper. By the use of his sense of smell he, in many cases, is able to determine whether animal sized or not, he presses his tongue against the sheet and determines whether it is "water leaf" or "sized" paper, and whether "slack," "medium" or "hard" sized, if a coated paper, his tongue will indicate it. Upon closer inspection and a liberal use of the sense of "sight" and "touch," he is able to estimate the weight per ream, the thickness of the sheet, the fibre composition, and general method of treatment in the beater-room, on the machine and in the finishing-room. He may also be able to give an estimate of bursting strength and general folding quality. The result of this method of testing is only comparative and, therefore, lacks the fundamental necessity of numerical expression for record purposes.

Interest in Testing Increases.

At the present time there is developing, both within and without the paper trade, a growing interest in the subject of paper testing. There is a demand on the part of the buyer for better methods to enable him to determine the quality of a paper. That there is this growing interest in the subject and a general demand for standard methods of testing is most conclusively shown by the work which is being accomplished in the commercial paper testing laboratories that are starting up in various parts of the country. This increasing general interest in paper testing has been the cause of developing a series of tests that apply both to the physical and chemical properties of a paper. These tests are not meant to give absolute values, but if due care is exercised in the selection of a representative sample and in making the necessary tests, then numerical values will be obtained which to a large degree indicate something of the quality of a paper. Such a method offers the only means whereby a record of a paper may be kept. In this discussion on paper testing it should be distinctly understood that these tests do not cover every quality or property a paper may have. The degree with which one sample is a colour match for a second sample must depend upon the ability of the eye of the individual. The matter of "finish" is a second property, which so far cannot be expressed numerically, and for which there are no physical tests. The degree with which one sample conforms to a second in finish is purely a personal element, and depends on the experience of the individual.

At the present time there are no physical methods by which an accurate comparison may be made to determine when a paper contains a larger amount of dirt than is acceptable, or just what degree of "wild formation" shall render a paper non-acceptable. These two properties of "dirt" and "formation" are left to the judgment of the individual, and depend on a hazy mental idea of what he individually believes to be a point beyond which a paper becomes undesirable for the particular purposes for which it was intended. The laboratory testing of a sheet of paper then narrows itself down to determine those properties which have a nearly fixed value, or may be expressed in definite numerical terms. These values are such that when due care is exercised two or more individuals using the same methods and samples and working independently will obtain duplicate results. In other words, such methods very largely eliminate the personal element of the individual wherever the properties of a paper may be given a numerical value.

Examining Paper Generally.

The general examination of paper may be subdivided into three parts as follows: (1) Microscopical examination; (2) physical tests: (3) chemical analysis. A microsopical examination will disclose the kind or kinds of fibres from which a given paper was made, and the experienced man will with considerable accuracy be enabled to estimate the proportions of various kinds of fibres used. The microscope also helps to indicate how much a stock has been beaten.

The testing to determine the physical properties of a paper is divided into determining —weight per ream, thickness, bursting strength, tensile strength, folding endurance, expansion and absorption.

The chemical analysis will disclose the amount of ash retained and the amount and kind of size used. A chemical examination will also give much information in regard to colours used. All of this information is of the utmost importance in determining the quality of a paper.

The principal purpose of a microscopical examination is to determine what fibre or fibres were used in making a paper, and then to estimate the relative proportion of each on a basis of 100 per cent. for the total fibre composition. Such an examination requires the following apparatus: beakers, tests tubes, slides for microscope, two long pointed steel dissecting needles, bunsen burner and tripod stand (or other means of heating sample), one large bottle of a ½ per cent. solution of caustic soda, one small bottle of 25 per cent. hydrochloric acid, six small dark coloured glass bottles, with dropping stoppers for stains, small pieces of filter paper and a microscope, which for ordinary work should be capable of magnifying about forty-five times. The binocular microscope will be found to be best suited for estimating work where it is desired to study the markings and special characteristics of a fibre, then a microscope capable of magnifying from 150 to 200 times should be used. As all vegetable fibres are highly transparent and almost entirely colourless when seen under the microscope, it is very necessary to use some staining solution to colour the fibre in order to bring out their size and shape and general markings. The best stain for this purpose is the so called "Herzberg" stain, which is what is known as as a selective stain, that is, it has the property of giving a yellow colour to most uncooked fibre, such as mechanical wood; chemical wood pulps are coloured an indigo blue;

and cotton, linen and some other fibres are coloured a wine red. This staining solution is made up as follows:—

Solution "A"—
20 grms. zinc chloride.
100 c.c. of water (preferably distilled).
Solution "B"—
2·1 grms. of potassium iodide.
0·1 grms. of iodide crystals.
5 c.c. of water (preferably distilled).

Dissolve "A" by adding the water to the zinc chloride in a glass beaker.

Dissolve "B" by adding a few drops of the water to the potassium iodide and iodine crystals in a glass beaker, and, after dissolving, add the remainder of the 5 c.c. of water.

The two solutions—"A" and "B"—are then mixed together and allowed to stand for twenty-four hours to settle, after which the clear liquid may be poured off and divided between two of the dark glass bottles with the dropping stoppers. All iodine solutions will fade in light, and should, therefore, be kept in the dark as much as possible. It is a very good plan to use two more of the dropper stoppered bottles to keep a concentrated solution of zinc chloride and water in one and a concentrated solution of potassium iodide and iodine in water in the second; these two solutions will be found handy in adjusting the Herzberg stain.

An Idea How to Prepare Paper for the Microscope.

The preparation of a sample of paper for the microscope is as follows: Several small pieces of paper of about the area of a cent are cut from different parts of the sheet of paper; these pieces are then placed in a beaker and covered with some half per cent. caustic soda solution; the whole mass is then brought to a boil over a suitable heating device. After boiling for about a minute, the liquid is poured off and some tap water added to wash out the caustic soda, and two or three drops of a 25 per cent. hydrochloric acid solution added to neutralise the alkali. The slightly acid solution is then poured off and enough of the small pieces of paper are pinched off and rolled into a ball of about the size of a pea. This small ball of pulp should be well rolled between the thumb and finger and then placed in a test tube and the test tube about half filled with water. Care must be exercised to rinse the hands after working each sample, to keep from contaminating the sample following. The test tube is then shaken vigorously until the paper has been entirely broken up and the fibres are well separated. A few fibres are next removed on the point of the microscope needle from the test tube, and a small sample is placed on each end of one of the microscope slides. The slide should be held in the holder over some black surface, as it is a great help to the eye to look at the white fibres against a black background. The wet fibres on a slide may best be dried by covering them with good filter paper and left for a few minutes to dry in the air.

The fibres are thoroughly dried and a drop of the Herzberg stain is added, and then the fibres are well "teased" out by the use of the two microscopic needles, a cover glass is placed upon the fibres and well pressed down, all the stain pressed out around the edges of the glass being removed with filter paper, and the slide polished with paper or cloth. The slide is next placed under the microscope and after studying the various fields an estimate of the proportion of each of the various kinds of fibres may be given. It is best to use four stains for this work, that is, each stain is of slightly different strength as each one gives the best results on certain fibres. For example, a stain that clearly brings out the wine red colour on cotton and linen fibres, as a rule, usually does not give the best blue colour on bleached soda and sulphite pulp; this same stain on ground wood pulp has almost no effect at all.

Stain Preparations.

In making up a stain to produce the best colour on the particular fibre, the following points should be remembered:

Two or three drops of water added to a good stain for rag and bleached chemical wood will tend to fade out the wine red colour, the blue colour will remain nearly unchanged, and the yellow colour on ground wood will be brought out very much clearer. In other words, a good rag stain, when used on ground wood, produces almost no colouring of the ground wood fibres.

The addition of two or three drops from the bottle containing the concentrated solution of iodine and potassium iodine, in water, will produce a deeper wine red on rag fibres, while the addition of a few drops of concentrated solution of zinc chloride in water will produce a deeper blue on chemical wood fibres.

It should be remembered that these iodine solutions will continually fade out, and that the best results may only be obtained when the stains give the proper colours. The easiest and best way in which to secure a stain of the right colouring capacity is to keep on hand the following pulps: Bleached soda and sulphite pulps, unbleached sulphite, ground wood, and beaten rag stock. The rag stock may most easily be secured by using a sheet of good quality filter paper, which is always made from "all rag" stock. Now take small bits of the bleached soda and bleached sulphite pulp and thoroughly mix them, after first separating them in water in a test tube. Place a small sample on a microscopic slide, thoroughly dry the fibres, add one drop of stain, separate fibres with the needles, place cover glass in position and place slide under microscope. Each fibre seen should be of a blue colour, the sulphite fibres appearing much wider and longer than soda fibres and should show a lighter blue colour, as the fibre is more translucent than a soda fibre, while the soda fibre should take a darker blue colour. Soda and sulphite fibres should show a slight colour difference, the soda fibres being coloured a darker indigo blue, while sulphite fibres should be coloured a lighter indigo blue. If this colour difference is not clearly brought out then either water or zinc chloride should be added, depending on whether it is desired to weaken or deepen the colours. Some rag fibres should now be added to the test tube, and a second slide made up, using a bottle of stain which is intended to produce best results on mixtures of rag and wood pulps. This second stain is adjusted by adding water, zinc chloride, or iodine-potassium-iodide, or all as may be needed until the three fibres, soda, sulphite and rag, are all clearly brought out. A third stain should be prepared for such papers as may contain ground wood by using mixture of ground wood and unbleached sulphite, and then adjusting the stains to give the best colours. The proper yellow for ground wood is the lemon yellow, never an orange yellow, as then the sulphite pulp is too slightly coloured and ground wood estimates are necessarily too high.

The experienced man may by using this method give some very surprising results. The American Bureau of Standards believe that in papers containing mixtures of rag and bleached chemical wood, a careful microscopical estimate is well within 5 per cent. of the correct fibre contents. For papers containing ground wood, especially where the percentage of ground wood is high, then the degree of accuracy is within 10 per cent. of the correct fibre contents.

Testing Devices.

For laboratory use, the quickest sheet-weighing device is the quadrant paper scales, so graduated that the corresponding ream weight—either 500 or 480 sheets—is read off directly in pounds. Thickness of a paper may best be determined by the use of a spring micrometer having a hand that travels around a circular dial. This dial is graduated into thousandths of an inch, and may be read to ten thousandths. In using such a gauge care should be taken to see that the pressure on the paper is constant, and also that the pressure surfaces are large enough not to compress the paper. The bursting strength of a paper is determined with a machine by which the paper is firmly clamped against a rubber diaphragm, through which the pressure is applied to a circular area of the paper measuring one square inch. The actual pressure of the liquid under the rubber diaphragm required to burst the paper is registered on a carefully calibrated pressure gauge, reading pounds per square inch. An average of ten readings is taken as the correct bursting strength. The tensile strength of a paper is determined upon a suitable machine, capable of accurately recording the tension required to break a strip of paper, when held at each end by suitable clamps, and the clamps are moved apart until breaking of the paper occurs. The folding endurance is measured on a machine in which a strip of paper of definite size is clamped. The clamps are held apart under definite tension and the paper is caused to bend back and forth upon itself until the fibres wear though at line of folding. The number of double folds is recorded automatically by a suitable device.

Expansion of a paper may be determined by submitting the paper to different atmospheric conditions and noting resultant size of sheet at each change in the atmosphere.

The measure of absorption of a paper is the height to which, in a given time, a liquid will rise by capillary action, when one end of a vertically held strip of paper is immersed in water. This test, as well as all physical tests, must be made under a uniform condition of humidity.

The work of the paper laboratory at the Bureau of Standards comprises the testing of papers for the Government service, and the general public; also a study of methods of paper manufacture for the purpose of obtaining information of value in the preparation of Government paper specifications. Information thus obtained is also at the disposal of the general public, who may be interested in selling or buying paper under definite requirements. It is not the intention of this bureau to go into general commercial paper testing, for the reason that there are regular commercial laboratories that are well equipped to do this work. Tests in dispute between outside parties will be taken up as an absolutely disinterested referee; in such case the bureau will very willingly give all possible assistance.

The equipment of the paper laboratory is at the service of the paper manufacturer as well as the user of paper for the investigation of problems of wide general interest, and it is desired to impress upon the trade and the general public that they are always welcome to such information as we may possess, provided such information does not come to us in a confidential manner.

Conclusions Arrived At.

The United States Government throughout its various branches consumes 40,000,000 pounds of paper each year. This large amount of paper includes almost every grade or kind on the American market. The acceptance or rejection of such a large and varied amount of paper necessarily involves good judgment on the part of the paper inspector, together with an intimate knowledge of the manufacture of all kinds of paper, and a knowledge of the various uses to which each grade may be placed. Is it reasonable to expect to find one or even two men who combine such a knowledge? It is the firm belief of the Bureau of Standards that all manufacturers and users of paper will readily recognise that a correct set of definite chemical and physical tests, when carried out under uniform conditions, will give more reliable results than could be obtained in any other way. It is also the belief of the Bureau of Standards that a knowledge as to the nature of our methods of paper testing, as well as the manner in which a paper specification is developed, will tend to convince the trade of the fairness with which this work is carried on. It is not meant that a set of tests will tell all about a paper, but that a set of definite tests, together with a judicial exercise of judgment in regard to colour, finish, formation and dirt, will tend to promote fairness to all concerned. The Government fully recognises the fact that wherever a specification imposes a hardship or restriction upon bidders in an unnecessary manner, that same restriction will necessarily tend to raise the price of that particular grade to the Government.

It is the belief of the Bureau of Standards that only by earnest co-operation between the Government testing laboratories and the manufacturers may the most desirable Government paper specifications be developed. The greatest degree of co-operation will come when manufacturers understand that their comments or criticisms on any point will be given the fullest consideration. Such discussions invariably develop much valuable data and the results are beneficent to all concerned.

A Book-Plate Exhibition.

An interesting exhibition of book-plates was opened last week at the Whitworth Institute, Manchester, the Curator of the Institute, Mr. R. Bateman, being the organiser of the show, which is interesting as being the first of its kind in that city, although a similar exhibition was held a few years ago in the neighbouring city of Liverpool. The collection contains examples of fine engraving on copper and from the stone. Among the plates interesting for personal associations are those of Pepys, the diarist, and Gibbs, the architect, which contain their portraits. The plates of Sydney Smith, O'Connell, Wilberforce, Carlyle, Samuel Rogers, Harrison Ainsworth, Fox, Horace Walpole, Palmerson, and Martin Tupper are shown, and the modern plates include Queen Mary's private book-plate, and those of Gladstone, Lord Leighton, and other well-known people. There is also an American section, which comprises about sixty plates by the late E. D. French, and some of the work of S. L. Smith, J. W. Spenceley, and W. F. Hopson.

PERFECTED BRONZING MACHINE

(Patent "KOHLBACH,")

At Work in the Finest British and Foreign Printing Works.

The speed of this Machine is enormous owing to the absence ot cylinders, thereby also doing away with all fear of gripper marks.

Contrary to the Dust Exhaust system of other makes, the used bronze does not pass back into the machine, but collects in a box, thereby ensuring first class work.

By the system of wipers a very much brighter result is obtained than by the system of rollers. The Machine will not only bronze and dust paper but any thickness of card. The rollers are automatically cleaned whilst the machine is actually at work.

A FEW OTHER SPECIALITIES:

Book Sewing Machines. "Marvel," for smaller runs at £60 for Treadle, or £75 for Power;

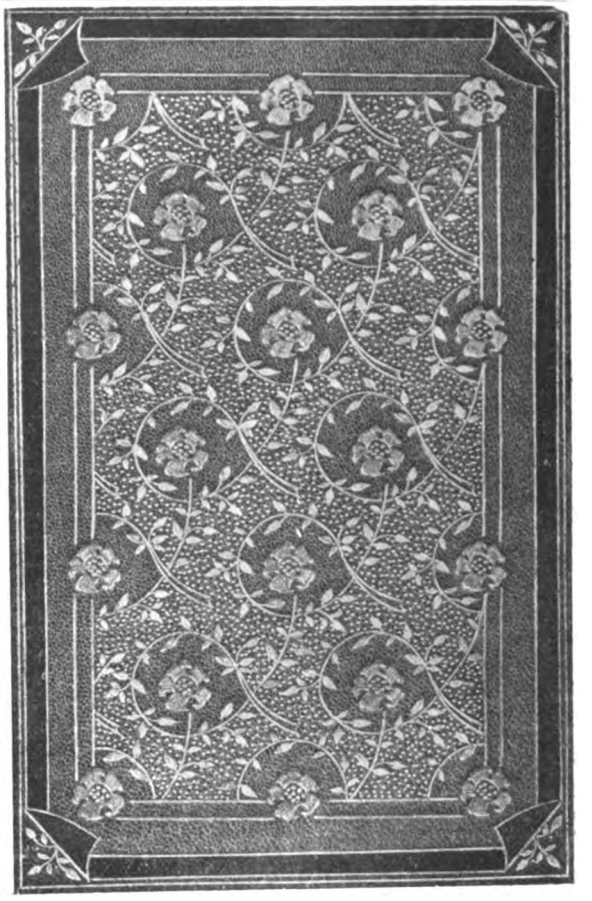
Technical Instruction in Bookbinding

XIV.



At the Borough Polytechnic Institute.

Although the bookbinding classes at this well-known South London centre of technical instruction (in the Borough-road, S.E.) end for the present session with the City and Guilds of London Institute examination on the 26th inst., it will no doubt be of interest to many to give some particulars about them, in view of the display of work executed by their students which was made on March 15th, and is further referred to below.

There are two classes, devoted respectively to Forwarding, under the control of J. S. Parrott, and Finishing, which is in charge of the chief instructor in binding, Mr. F. Maullen. The first of these classes meets for practical work on Monday or Tuesday, from 8 to 10 p.m., lectures on the subject being given on Thursday evenings from 8 to 9.30. This course is both theoretical and practical, and comprises:—

Paper and book sizes; signatures; folding and collating; pulling books to pieces and refolding; guarding and folding plates; sewing and overcasting; inboard forwarding; edge gilding; head banding; covering in cloth and leather, half bound and whole bound; siding and pasting down. Cleaning, washing, and restoring books; print inlaying; map mounting, calf colouring, tree marbling, and edge marbling.

The class in Finishing meets, for practical work, on Thursday or Friday evenings, from 8 to 10, lectures on the History of Bookbinding and on Design Applied to Book Decoration being delivered on Tuesdays, from 8 to 9.30 p.m. The work of this class includes the elementary use of tools; styles for half-bound and whole-bound work in calf, morocco, vellum, silk and velvet; hand lettering and lettering with types; line and gouge work; the antique, classic, and modern styles; tooled and illuminated edges; the renovation of old and decayed bindings, etc. Students are advised, in addition, to attend the art classes for instruction in drawing (to which they are admitted at half fees), as evidence of some skill in this subject must be forthcoming. These continue for a couple of months after the bookbinding class finishes it work. The fee for the session, covering a period of about six months, is 8s. for either class.

No. 2.

No. 1

The classes are held in a large and well-lighted room in the basement of the building, fitted with all necessary tools and appliances. The number of students who entered for instruction during the term now on the point of expiry was 59, *i.e.*, in Forwarding 25, and in Finishing 34. Of this number about half were new pupils, the rest having attended the classes in one or more previous sessions.

The annual "Open House" function at the Institute last month attracted quite the usual crowd of interested visitors, and is perhaps the best method of popularising and extending the utility of an institution of this sort. In our experience, a mere trade exhibition of specimens of work attracts but little interest, and is, as a rule, poorly attended, but the opportunity of seeing in operation the workshops where such exhibits are produced is generally taken full advantage of, tends to spread a knowledge of what is being done at a place like a technical school, and often leads to a desire on the part of the eligible visitor to avail himself of the cheap and thorough scheme of instruction it offers. On the occasion referred to, the bookbinding room was thronged throughout the few hours that it remained open for inspection, and great interest was shown by those present in the various operations that were being carried on before their eyes. The lad at the marbling trough had an admiring audience all the evening, and must have felt no small pride in his achievements with the colours. Simple forwarding and finishing jobs were also in progress, and on the large central table was a very extensive and elaborate display of examples of bookbinding work executed at the Institute, mainly specimens of high-class finishing. There were not, it is true, many bound books shown, most of the finely tooled and inlaid jobs on view being single specimen boards, but there was quite sufficient to make it evident that the Instructors in Binding have their classes well in hand, and aim at a high standard of workmanship. There were some bound volumes in an adjacent bookcase, and a few more were to be seen in a case in the Edric Hall. These, however, attracted nothing like the attention given to the lads at work, and thus demonstrated the fact—which must be familiar enough to most organisers of small trade exhibitions—that practical work is always of greater interest to the public at large than its results. We are inclined to think that a large accession of students to the various classes, not only at the Borough Polytechnic but at other similar institutions, would result from a function of this kind being held just before the commencement rather than at the end of the Session. In the latter case, any enthusiasm that may be evoked in the minds of lads who pass through the shops has more than time to cool down, and be indeed forgotten, during the six months that must elapse before the would-be student could put it into practice by joining

Digitized by Google

the particular class which appeals to him more than any other.

We illustrate herewith a few examples of Finishing executed by the students of Bookbinding at the Borough Polytechnic Institute.

No. 1 is carried out in pale blue morocco, and it will be noticed that the floral ornament which forms the scheme of decoration rises naturally from the bottom of the board, as it always should do. The word "Keats" is worked with gouges.

No. 2 is a cover in light green morocco. The floral diaper design which covers most of the board is surrounded with a plain inlaid strip

No. 3.

of dark red morocco, the upturned corners being in red of a slightly lighter shade.

No. 3 is in Niger morocco, the floral design both in this and the previous example being closely stopped out.

The President of the United States, Dr. Woodrow Wilson, has a family connection with the "art preservative." According to *The Never Sleep Gazette*, the bright little monthly issued by the Regan Printing House of Chicago, President Wilson's grandfather was a "poor printer," and hence, it argues, there is no chance of doubling the rate on second-class mail while Dr. Woodrow writes the prescriptions. This will be for a period of forty-seven months, and that's a pretty good stretch in which the American people may breathe easy.

The Hackney Borough Council has recommended the following tenders for acceptance: General printing work, Messrs. C. Straker and Sons, Ltd.; registration printing, including county and borough lists, jury lists, etc., Messrs. Darling and Son, Ltd.; stationery, Drake, Driver and Leaver.

Thomas Senior, foreman compositor, of Caxton-street, Barnsley, was found hanging dead by a rope at the *Chronicle* Office, Barnsley.

Institute of Printers and Kindred TRADES.

Annual Dinner.

A brilliant gathering and record attendance marked the thirteenth annual dinner of the Institute of Printers and Kindred Trades of the British Empire, held on the 8th inst. at the Connaught Rooms, Great Queen-street, Kingsway. Sir George Riddell (President of the Institute) was in the chair, supported by Col. the Hon. Harry Lawson, M.P., Sir George Wyatt Truscott, Bart., Sir Frank Newnes, Bart., Capt. the Hon. Bertrand Russell, Sir Rowland Bailey, C.B., M.V.O., I.S.O. (Controller of H.M. Stationery Office), Sir William Robertson Nicoll, Judge Rentoul, K.C., Mr. Anthony Hope Hawkins, Mr. J. J. Keliher (Past President Master Printers' Association), Mr. Frank H. Taylor, Mr. W. J. Whyte, Mr. H. E. Morgan, Mr. R. Loring, Mr. J. Jeremiah, Mr. G. J. Berridge, C.C., Mr. R. E. Thomas, Mr. J. C M. Nichols, Mr. H. C. Cottle, Mr. Sydney H. Caslon, Mr. Walter Grierson, Mr. J. B. Stevenson, Mr. Horace Morgan, Mr. Edward Hudson, Mr. Galloway Fraser, Mr. C. H. Roud (deputy chairman), Mr. R. B. Brett, Mr. W. H. Burchell and Mr. C. J. Drummond (joint hon. secretaries), Mr. R. J. Elliston, Mr. A. Langley, Mr. G. K. Naylor, L.C.C., Mr. J. R. Riddell, Mr. H. Blaikley, Mr. H. C. Goodall, Mr. D. Greenhill, Mr. G. E. Holloway, Mr. T. J. Hunt, Mr. A. Bartzack, Mr. Job S. Morriss, Mr. F. W. Seeley, Mr. Francis Sheridan, Mr. C. B. Sheridan, Mr. G. H. Stockman, Mr. E. Taylor Thomlinson, Mr. C. R. Warde, etc. The company of ladies and gentlemen numbered upwards of 400, and were seated at separate tables arranged for groups of friends.

"A Man of Many Worries."

After an excellent menu had been served, the Chairman proposed the royal toasts, which were loyally honoured. He then submitted "Success to the Institute of Printers and Kindred Trades." He said when his friend Mr. Drummond asked him to preside there that night he invited Mr. Drummond to tell him what was expected of him in the way of a speech. Mr. Drummond's reply was very characteristic. He said, "For heaven's sake don't be long, don't be serious, and above all don't forget to remind your audience that the admirable work of this Institute cannot be carried on without funds." He would endeavour to obey the two first injunctions; as to the last, he would refer to the financial question in a delicate and appropriate manner. The objects of the Institute were educational and social. The many vicissitudes which the printing trade underwent rendered education an absolute necessity. He observed that the St. Bride Foundation technical library contained 26,700 volumes, which was a very convincing reason that the printer required an extended education. With regard to the social aspect, as they all knew to their cost, the printer was a man of many worries. In fact, he knew of no man who required more social relaxation than the printer. There was no man who was subject to more ignorant criticism than the printer was. One of the objects of this Institute was to provide the printer with a little happiness in the course of what was usually a very unhappy and troubled business life. The printing trade had always exercised a great fascination over him. It was a romantic trade; a recording angel which recorded the doings, thoughts and ideas of mankind. That was a very noble thing to do, and his only regret was that like most other romances it was not as profitable as it should be. The past year had been a very important one in the history of the newspaper trade. First, because his friend Sir Rowland Bailey had assisted Lloyd George and other persons to spend money and give out the largest printing order that had ever been given in Great Britain, and, whatever might be thought of the National Insurance Act, it was some consolation to know that printers had been able to secure some share of the spoil. Secondly, because the costing question had occupied the attention of printers, and, although he was not a practical printer, he was assured by competent authorities that the resolution passed at the Costing Conference was going to bring about increased profits for the printer, and hence he was quite sure the resolution was a most admirable one. (Hear, hear.) Some misguided persons had said that newspapers did not offer the best medium for advertising. Mr. Lawson and himself regarded any ideas of that sort as heretical and without any foundation whatever. (Laughter.) They could not advertise, however, on hoardings, in newspapers, pamphlets, annuals, or by any other means without the aid of the printer. He ventured to prophesy that advertising was going to increase, and whatever might be the views they held as to the ethics of advertising, the printing business had everything to gain and nothing to lose by an increase in advertising. So far as the newspaper trade was concerned, there was an enormous number of newspapers and periodicals issued at the present time, and he did not think they were going to decrease. From that point of view also he thought they might congratulate themselves upon the future. Referring to the introduction of the intaglio process of printing into the newspaper business, the Chairman said that probably by the time they met there again next year they might have serious cause to reflect upon the question of putting in fresh plant. Concluding, he asked the company to drink the toast with every enthusiasm. The Institute performed a most admirable service to the trade, and was worthy of every support. (Applause.)

The Lack of Cohesion.

Mr. H. J. Goss (chairman of the Council), in responding to the toast, expressed the thanks of the Council of the Institute to the President for the kind expressions he had extended to "us poor printers." The Institute had always been fortunate in its presidents, and they were not the least so on the present occasion. (Hear, hear.) He congratulated Sir George Riddell, not only upon the honour that had been conferred upon him individually, as the guiding light of a weekly newspaper which, he thought he was right in saying, had the largest circulation of any in the British Empire, but also for the further honour that had been conferred upon journalism and incidentally upon the whole of the printing world. There were, he believed, some eight thousand employing printers in this country. It always appeared to him that they were divided into two camps. There was one on one side, and 7,999 on the other. It was generally admitted that if there was one thing more than another adversely affecting this industry it was this lack of cohesion and want of harmony amongst its members. It was to overcome this that the work of the Institute was so largely directed—a work in which, he ventured to suggest, they as an institute had not been wholly un.

successful. Touching upon the work of the year, Mr. Goss pointed out that they had from time to time lectures and debates, under which head he drew attention to the lecture to be delivered on the 23rd inst. by Mr. Vincent Brooks on the vexed question of trades unionism and the merits or demerits of organised and unorganised labour, which should proved highly interesting to employing printers. In June a visit had been arranged to the Caxton Convalescent Home, and later on visits were in contemplation to the International Printing Trade and Graphic Arts Exhibition at Amsterdam, and also to the International Exhibition at Ghent. There would be the usual conversazione in October, and at least one bohemian concert during the autumn, so that it would be seen that they endeavoured to be as many-sided and as cosmopolitan as possible. If there was one thing lacking it was support, of which the Council would like a little more. (Applause.)

"Literature and Journalism."

Sir Frank Newnes, in proposing "Literature and Journalism," remarked that some people thought there was a great gulf between the two, which was a wrong way of looking at the subject altogether. No doubt there was a great difference, because of course literature was written for all time, whilst journalism was done just for the passing moment. He did not think it was true to say there was more trash written and published to-day than forty or fifty years ago. They must remember that with the increase in education there was a wider reading public, and the production of literature multiplied. The bad literature of forty or fifty years ago was forgotten, and all that was left was the good, which would stand the test of time. (Hear, hear.)

Sir William Robertson Nicoll responded in a humorous speech, and in giving an account of his early years in journalism, which commenced forty-four years ago, said some of his most loyal helpers and most faithful allies had been printers.

Mr. Anthony Hope Hawkins also responded to the toast, and said that hardly at any time within the last twenty years could he have replied to such a toast with more courage and confidence than on the present occasion. Writers of to-day had got rid of the oppression which had affected them in the past, and they had now two notable revivals—that of the drama and of literature. An interesting phenomena had been the rebirth of the theatre and of poetry. One well-known poet had gone so far as to say that he could live by his profession. (Laughter.) That was a great change. There was every reason to take an encouraging view of the progress that was being made in regard to literature and the making of books cheap. It was encouraging for the author to find there was a great public waiting and ready to read what they had long been wanting, and if there was one thing certain among the changes and troubles of this mortal life it was that the interest in books would continue to grow and increase, and with it he trusted there would grow and increase the friendship and alliance between all interested in literary production. (Applause.)

His Honour Judge Rentoul gave the toast of "The House of Commons," to which the Hon. Harry Lawson, M.P., replied. The toast of "The Visitors" was submitted by Mr. C. J. Drummond, coupled with the name of Mr. Frank Taylor, general manager of Linotype and Machinery, Ltd., who appropriately responded.

During the dinner a suitable programme of music was contributed by Mr. A. F. Day's string quartette, and between the speeches a capital concert was given by the following talented artistes:—Mr. Budden Morriss (piano solos), the Misses Ivell and Lilley (songs and duets), Mr. Stewart Gardiner (baritone songs), and Miss Dorothy Varick (character sketches at the piano). The pianoforte accompanist was Miss Asdaile.

The Souvenir.

During the evening a magnificently produced Souvenir of specimens of various styles of printing work done during 1913 was presented to each guest. It is enclosed in a stiff cover in imitation of an elaborate old binding in "Levant Morocco," with gilt border and title, and the Institute monogram embossed in blue in the centre. The lining paper is in rose watered silk. The contents comprise an illustrated booklet descriptive of the "Caxton Convalescent Home," finely printed in colours and photo tint on a grained paper by Mr. A. Chris. Fowler; a specimen page for introduction to a book; examples of music printing with borders; a specimen of Messrs. Raphael Tuck and Sons' "Oilette" process; a specimen of printing from a direct deposited nickel-steel electro, by Messrs. Badoureau and Jones, Ltd.; a typographical specimen printed in three printings; a specimen of circular from type and borders in two colours; an example of lithographic offset work; a specimen of typesetting on the Typograph; a three-colour fashion plate; specimens of over printing with Glossine varnish; of offset and coloured tint printing; of machine-printed photogravure; a three-colour music title; map printing from blocks; Radiotint flat-bed photogravure; a letterpress window bill; a page from a booklet recently published by Linotype and Machinery Ltd.; an illustrated article on "How Guillotine Knives are made"; a specimen book illustration printed by three-colour process with tint; a Carbo-Gravure specimen in two workings; a reproduction of a Baxter Print in four workings; a specimen of imitation photogravure; a page of linotype composition; a reproduction in four printings on a Miehle machine of roses photographed direct from Nature by the Polychromide process; four-colour printing by Messrs. Cooper and Budd, Ltd.; an example of photography and engraving by the L.C.C. School of Photo-Engraving, Bolt-court, Fleet-street, E.C.; lithographic work by Messrs. Thos. Forman and Sons, Nottingham; three winning designs in a L.S.C. Jobbing Guild title-page competition; a lithographic offset specimen by the Honours Students of St. Bride Foundation Lithographic Classes, and a typographic specimen by the St. Bride Foundation Printing School; a catalogue cover designed and drawn direct on stone and lithographed in tint and monotone by Messrs. Langley and Sons, Ltd.; a design for a Masonic banquet programme, and various other specimens of colour printing.

We cordially endorse the hearty congratulations expressed by the President at the dinner to those gentlemen responsible for this interesting production.

Stationery Exports.

The following are the exports of stationery, other than paper, from the United Kingdom for the month of March, compared with the corresponding month of the two previous years:—

	1911.	1912.	1913.
To Germany ...	£11,888	£10,237	£12,507
„ France... ...	5,135	4,671	4,731
„ United States of America...	6,229	6,768	5,316
„ British India...	14,881	18,252	16,932
„ Straits Settlements ...	3,407	3,383	4,819
„ Ceylon ...	2,320	2,064	2,913
„ Australia ...	11,518	10,894	12,995
„ New Zealand	2,769	3,263	3,343
„ Canada ...	4,497	6,030	6,327
„ Other Countries... ...	64,857	63,945	70,069
Totals	£127,001	£129,507	£139,952

For the three months, ending March, the total exports reached £417,871, an increase of £26,929 over the same period of 1912, and an increase of £49,677 over the corresponding period of 1911.

Exports of Printed Books.

The following were the exports of printed books from the United Kingdom during March, compared with other previous periods:—

	March		Jan.-March	
	cwts.	£	cwts.	£
1913	34,162	210,075	98,300	578,681
1912	36,790	220,778	96,754	575,420
1911	39 326	198 238	91,919	539,967

The Ghent Exhibition.

Now that the final arrangements of the British Section are complete it is possible to give (by courtesy of the Board of Trade, Exhibitions Branch) some general idea of how Great Britain is to be represented at the International Exhibition that opens at Ghent at the end of this month. The British Pavilion which, as has already been stated, stands on the left side of the Court of Honour, facing the French Pavilion, is a large low building approximately 130 yards square, divided into a Machinery Hall and four surrounding galleries, where exhibits by a number of Government Departments, exhibits of British Pottery and of Arts and Crafts, and a library of British trade newspapers will be housed.

The industries of Ghent are very largely textile weaving and the manufacture of machinery, and have earned for the town the title of "The Manchester of Belgium," containing as it does more than a million spindles for cotton, nearly half-a-million spindles for linen and jute, and about 50,000 looms; in addition steam engines representing about 95,000 horse-power are manufactured there yearly. These considerations have caused the Board of Trade to select machinery as the central feature of the British display. Practically every type of machine used for spinning and weaving will be shown at work, and it will be possible to trace the various processes from the moment that the bale of raw material is opened to the moment the finished fabric leaves the machine.

Among other machinery exhibits a great power plane, weighing 25 tons and cutting steel and iron with the ease of a carpenter working wood, will draw crowds of visitors, while powerful drills which bore their way through a boiler plane many times in a single minute, will be hardly less interesting.

Britain's newest industry is also to make a special display. Though it is not yet generally known, we have as a nation secured a strong lead in the manufacture of everything that caters for the great public demand for cinematography with perhaps the exception of the films.

Recognising the fast-growing importance and the great possibilities of this new industry, the Exhibitions Branch of the Board of Trade, the Government Department responsible for the organisation of the British Section, has arranged a display of the chief British firms, which it is hoped will still further strengthen the position of the industry.

This section will, it is understood, include every branch of the industry from the cameras with which the subject is photographed, to the erection and fitting of the theatres and the actual display of the pictures.

Very interesting displays are also to be made by several great English railways, notably by the Great Central Railway. It was originally intended that the new monster engine, the "Sir Sam Fay," which has been built by the company in order to accelerate their fish traffic to London, should be sent over to Ghent, but it was found that it could not be spared so long a period.

The largest display in the Government Galleries will be that of the Post Office, which will include examples of the various instruments used by the Department for the rapid despatch of telegrams and a working model of an overhead line.

The exhibit of the National Physical Laboratory will illustrate the work done by that department in elucidating the problems of flight, and show, among other things, how the air currents playing upon an aeroplane are photographed. The work which this Department is doing is practically unknown to the public, though fully appreciated by manufacturers of aeroplanes, who send models and actual parts to be tested for air resistance.

Another interesting Government display will be that showing the fight against tropical disease, while the exhibits arranged by his Majesty's Commissioners for Prisons and the Board of Agriculture and Fisheries are certain to be very popular.

In the preparation of the Arts and Crafts exhibits the Exhibitions Branch has been assisted by a committee, of which Sir Cecil Smith is chairman, and Commandatore Walter Crane vice-chairman, and a very representative collection of work has been got together under the direction of Sir Isidore Spielmann, the Director for Art.

The exhibit of trade and technical journals which will be shown in a library opening out of the Arts and Crafts Section, and specially designed and decorated by Mr. Frank Brangwyn, A.R.A., is a new departure in British exhibits, and should prove the means of bringing the advertisements of British manufacturers before Continental buyers.

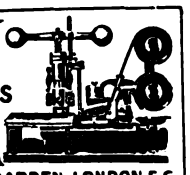
By the work of the Exhibitions Branch the British manufacturer is relieved of much of the trouble and cost of exhibiting his goods, for the whole work of organisation is undertaken by the Department. Until the Exhibitions Branch was founded the exhibitor was obliged to make his own arrangements for the decoration of his stand, the laying of foundations for his machinery, the storing of his packing cases, and for much similar work, all of which involved expenditure of both time and money. This work is now all undertaken for him, and even when it is necessary for him to pay for any part of it, he is given the benefit of the special rates which the Department has secured from contractors before the prices are raised on the approach of the opening date.

BRITISH Exports & Imports of Printing Type.

The following figures show the exports and imports of printing type into the United Kingdom for the periods mentioned:—

Imports:—

	March		Jan.-March	
	Tons.	£	Tons.	£
1913	3	606	14	2,834
1912	6	773	10	1,684
1911	8	1,497	18	3,478

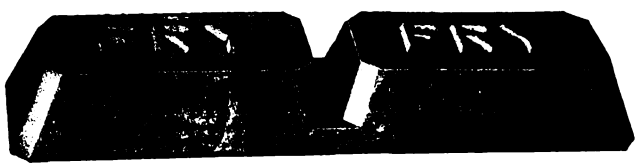


Exports:—

	March		Jan.-March	
	Tons.	£	Tons.	£
1913	65	11,265	155	27,147
1912	25	4,516	113	16,027
1911	58	6,549	134	18,722

GOVERNMENT PRINTING REDUCED.—In the effort to effect greater economies in the Government Printing bill, an inquiry has been held into the possibility of reducing the cost of certain Blue-books, the issue of which is pending. When the Publications Committee met and reappointed Sir George Toulmin, M.P., as chairman, it was stated by Sir Rowland Bailey, Controller of the Stationery Office, who gave evidence on the matter, that the work of the Committee, chiefly in restraining the publication of unnecessary matter in official documents, had resulted in an actual realised saving of £150,000 a year.

IF you have something to sell, advertise it! Talk it to every man who needs it, whether he knows he needs it or not. Proclaim its merits from the housetop, and if you believe in something really worth while, if you have at your disposal something of value to the rest of mankind or to your community, remember the rest of mankind or the community will never come to your door demanding the particular thing you have to sell. If you hide your light under a bushel, you are digging your own grave and writing your own epitaph. Demands are the result of advertising campaigns, which not only sell merchandise, books, literature and ideas, but which benefit the entire world in an educative way that nothing else has ever done.



MR. F. ATTERBURY, C.B., has been appointed Controller of the Stationery Office, in succession to Sir Rowland Bailey, who has retired on the ground of age.

Tariff Changes
AND
CUSTOMS REGULATIONS.

From the "Board of Trade Journal."

U.S.A.

It has been decided by the Court of Customs Appeals that "Windowphanie paper," *i.e.*, paper with decorated surface, not lithographed, intended to be applied to glass windows to give them the appearance of stained glass and which has been subjected to processes by which, after a finished design in colours had been imprinted on it, it was saturated with linseed oil and no varnish or other substance was applied to produce an added surface, is not a surface-coated paper. It is dutiable as a "paper with the surface decorated or covered with a design, fancy effect, pattern or character, . . . but not by lithographic process" under No. 411 of the Tariff at the rate of 4½ cents per lb. This reverses a previous decision, mentioned in the *British and Colonial Printer and Stationer* for December 26th last.

Decalcomanias, lithographically printed, *not* in ceramic colours, and backed with metal leaf, are dutiable as "all other decalcomanias" under No. 412, at 40 cents per lb.

Articles of paper lithographically printed, which exhibit in a pictorial manner the outline, form, and mechanical features of either a locomotive or an automobile, the various parts being accurately shown by super-imposed paper flaps, arranged in proper order, hinged so that they may be turned back to show the interior mechanism of the machine or engine, are dutiable as "charts" under No. 416, at 25 per cent. *ad valorem*.

Uruguay.

It is announced that empty jewel cases of paper are to pay a specific duty of about 2s. 3d. per lb., as well as the additional duties ordinarily leviable, if made of leather, then the duty is nearly twice as much.

Union of South Africa.

It has been arranged that the "Paragon" printing press is dutiable under No. 175 of the Tariff, at the rate of 15 per cent. *ad valorem*, a rebate of 3 per cent. being allowed in cases where the machine is proved to be of British manufacture.

Subscribers desiring information as to the taking out of Patents are invited to write. Letters to be endorsed "PATENT DEPARTMENT," Office of the "British and Colonial Printer and Stationer," 58, Shoe-lane, London, E.C. Telegrams: Stonhill, Fleet, London.

Applications.

7,537 LANGLEY, B., apparatus for feeding envelopes and the like.
7,551 BANCROFT, J. S., and INDAHL, M.C., matrix holders for typecasting machines.

There is published only one weekly paper representative of the interests of employing printers. It is the most popular Printers' Paper read, because:

It is the only strictly Business Paper.
The only Newspaper.
The only Paper which holds the attention of the man who owns the Plant.
The PRINTING TRADE NEWS does not attempt to teach printers to set type, but it is the foremost authority on the latest efficiency methods, the organization activities, progress in cost system work, approved methods of printers' advertising and anything and everything that tends to make the printing business a pleasant and profitable one.

We have good mechanics. Let us have good business men. Let the NEWS come to YOU every week. Europe **$5.00** per year; Canada **$3.00**. 64 Pages weekly.

The Deal Home Musical Society.

A highly successful concert was held at the Falcon Hotel, Gough-square, on Friday last, when Mr. H. J. Goss, the chairman of Council of the Institute of Printers and Kindred Trades, shared the honour of chairmanship with Mr. Wm. Brett Plummer, the genial representative of Messrs. John Swain and Son, Ltd.

Mr. H. F. Parker, the secretary of the Deal Home, announced that the secretaries of the Caxton Home at Limpsfield, and of the Printers' Medical Aid and himself were working together for the best interests of each one's own particular cause by a bond of sympathy that was bound to have a beneficial effect upon their respective committees and their subscribers. There was no antagonism between the secretaries, and there must be none between the most enthusiastic workers in any of their charities. Their scope of work was more than justified by the results and by the increased support which was being accorded to each of the Associations. Printers had the character of being clannish, and he, for one, was very proud of that traditional spirit. It was a good sign, too, to find gentlemen like Mr. C. W. Bowerman, M.P., keenly interested and equally respected in each of these organisations, and the same could be said of Mr. H. W. Howes, the secretary of the Printers' Managers Trade Society, and of the secretaries of all the other trade societies. It was a sign of true co-operation, and it augured well for the permanent success of these charities that they were all truly proud of them, and that they were worthy of all the support which could be given them.

The programme opened with a pianoforte solo by Mr. H. W. Cook, the talented accompanist of the Society, followed by the Scotch song, "Beautiful Sunday," by Mr. Ernest Hayward. Mr. F. C. Parker, who always scores, was particularly good in his second song, "Down in the Deep," which allowed his voice power to disclose its full range and compass, and brought him great applause. Mr. R. H. Evans is a refined comedian who was also heard to advantage in his song, "Come down and hear the Gramophone." Mr. G. T. Bostock is probably the best-known tenor at City smoking concerts, especially at printers' functions, and he was rewarded with an encore after each song, his voice getting the top notes both clearly and sweetly—a most prized asset to a singer. Another clever turn was Mr. Harry Sargent, whose rendering of the monologue of the "Caretaker" was specially worthy of mention. Mr. Bruce Andrews always scores in that pretty Cornish song, the "Floral Dance," and merited the applause at the conclusion of his singing. Messrs. King and Jack are two popular comedians and duetists, their duet "King Caractacus" being too funny for description. Mr. Oliver Daly was, however, the tit-bit in the humorous line; his feats of conjuring were particularly neat and clever, and without the necessity of a lot of "properties" he was equally talented as a humorist, and the hackneyed monologue of the "Street Watchman" was treated in such an entirely novel manner that it created a new interest in its recital, and was loudly applauded at its conclusion. The Norlon Quartette Party, Messrs. D. W. Davis, B. T. Davis, A. Davis and Norman Brown, are great assets to any programme. Their rendering of "Annie Laurie" was very fine, and the vocal accompaniment was so modulated as to heighten the solo all through the song; even more effective, if possible, was their encore, "Farewell," which met with a great reception. Each member of the party also contributed to the programme. The musical directors and hon. secretaries, Mr. W. A. Fricker and Mr. W. J. Mould deserved the hearty vote of thanks accorded them. These concerts, as can be seen by the items recorded, rank amongst some of the best of the kind—even at City functions which are generally above the average quality of the usual local concert. The next concert is on Friday, April 25th.

Mr. H. F. Parker, the Secretary of the Home, in announcing the "plate," congratulated the chairman upon the encouraging results of their efforts. They would have the great satisfaction of knowing that they had made it possible for several more employees in the allied trades to go to the Home to recuperate their health and strength. Mr. Goss was held in high esteem by all who knew him in private or in public life. Only this week he had been elected—not for the first time, however—a Guardian for the Ward of South St. Pancras, where his past labours were widely known and appreciated. Mr. Parker could speak of him as a skilled printer and a good employer. His qualities were not only appreciated by the rank and file, but were suitably respected by the Institute of Printers and Kindred Trades, who had elected him to the honoured position of Chairman of the Council. Mr. Wm. Brett Plummer was, as they all knew, not only a very popular man, but a much-respected representative of that enterprising and pioneer firm of process engravers and electrotypers, Messrs. John Swain and Son, Ltd. Mr. Plummer was, perhaps, better known as a skilled and highly original artist and designer, whose services had been commandeered time and again by all sections of the trade. His efforts this evening would add to his popularity, and they could thank him and Mr. Goss for the very kind way that they had assisted in the good work in which the committee and governors of the Lloyd Memorial Seaside Home were engaged in. In the name of that committee Mr. Parker thanked them most sincerely.

Mr. W. A. Fricker, as the Hon. Secretary of the Musical Society, and Assistant Secretary of the Home, in proposing the health of the Chairmen, said that it gave him great pleasure to ask them to drink to the health of Mr. H. J. Goss and to Mr. Wm. Brett Plummer, because these two gentlemen had so thoroughly gone into the history of the Home before consenting to give him their aid. That they should be here this evening was, therefore, a splendid testimonial to the satisfactory working of this useful trade institution. He asked them to drink to the health of the Chairmen. The toast was received with musical honours.

Mr. H. J. Goss, in reply, said it was quite true that he had thoroughly investigated the working of the Home, and he was convinced that they had in the Lloyd Memorial Seaside Home a well-managed and, what was quite as important, a most economically conducted Home of rest. It was one to which a man could send his wife and feel perfectly satisfied that she would receive sympathetic treatment and care, with all the attractiveness of real home life. It was a real home from home, that should be much appreciated by those who used it He was specially interested in the Lloyd Home because it was the only trade institution which catered for the female section of their workers, who were, as they all knew, not only a numerous body of employees, but who sadly needed a helping hand in time of sickness. This Home would be a great blessing to women working in the allied trades. His own employees, he believed, were going to subscribe to the Deal Home, and that proved that they recognised the advantages which were offered to them; and he felt sure that other firms would be coming to the aid of the Lloyd Home Committee as soon as they realised what a magnificent institution was in their midst. He had thoroughly examined their balance-sheet, and was pleased to note that the deficiency therein had been occasioned by writing off for the depreciation of stock. That was a sound business policy, and he hoped that they would be able to continue it. He felt sure that Mr. Parker was thoroughly capable of maintaining the high state of efficiency which had been reached, and he, himself, should continue to take a personal interest in the work, for it

Mr. H. J. Goss.

was worthy of all the help and assistance which they could give it. In conclusion, he thanked the company for their presence and support, and for the kind way in which they received the toast.

Mr. Wm. Brett Plummer, in acknowledging the toast, said that it gave him great pleasure to assist his co-chairman in such a truly excellent work. They had not much time at their disposal, but they had done their best, and although the amount was not quite so much as it might have been if they had a longer notice, yet still it was both satisfactory and useful. He had known Mr. Parker for many years, and there were but few men better known in the printing trades than he was. The trade would put their confidence in a man so well tried, and that, he thought, was a good sign for the continued prosperity of the Home. There was no other institution connected with the trade to which females could be sent, and he was convinced that the Deal Home Committee had supplied a real and long-waited for requirement. This phase of the work had strongly appealed to him, and he felt sure it would appeal to many others. He was at all times willing to help their trade charities, but, deserving as they undoubtedly were, there was none that deserved more support than this Home of Rest. He thought there was ample room for all their charitable institutions, and he hoped that they would one and all continue to prosper, and especially the Lloyd Memorial Seaside Home. He concluded by thanking the artistes for the very pleasant entertainment they had supplied, and also for the kind manner in which they had received the toast of his health.

It is announced that the Governors of King's College Hospital have practically completed arrangements for granting a lease of the hospital buildings near Lincoln's-inn-fields to Messrs. W. H. Smith and Sons, Ltd.

Trade Notes.

THE inaugural dinner of the Post Card Publishers' Association was held at the Holborn Restaurant on Saturday.

MR. C. J. DRUMMOND, of the Board of Trade, has been appointed to the Commission of the Peace for the County of London

WE regret to announce the death of Mr. John Callander Ross, a leader writer on the staff of the *Times* for over 30 years.

At the annual Belfast Musical Competitions, held in the Ulster Hall in that city, last Friday, the Choral Society in connection with Messrs. Baird's printing works was awarded a first prize.

MR. G. ROWLAND BLADES, Master of the Gardeners' Company, and a member of the firm of Messrs. Blades, East and Blades, printers, Abchurch-lane, E.C., has been elected as Common Councilman for the Ward of Candlewick.

SIR HENRY LUCY is to take the chair at the twenty-third annual dinner of the Readers' Pensions Committee in aid of the pensions for Correctors of the Press and their widows, at the Holborn Restaurant, on Saturday, May 3rd.

THE Lord Mayor of Liverpool will receive the members of the Printers' Managers and Overseers Association in the Town Hall, on the occasion of the United Meeting of the Centres of the Association, on Saturday, June 21st, in that city.

ACCORDING to statistics prepared by the Osaka (Japan) Chamber of Commerce, there are 300 men and 500 children regularly employed in Osaka City in the bookbinding trade. In the printing trade, 1,946 men, 149 women and 170 children, and in the manufacture of printing ink, 174 men and 20 women.

SMART WORK.—Early on Friday morning the cricket pavilion on the Nevill Athletic Ground, near Tunbridge Wells, was burned down, supposedly by the action of suffragettes, and gave the opportunity to the *Tunbridge Wells Advertiser* to do a bit of smart work, for in its second edition of Friday there was a series of excellent half-tone reproductions of photographs of the ruins of the pavilion, accompanied by full particulars of the disaster, interviews with suffragettes, non-suffragettes and others. Our contemporary is to be congratulated on its enterprise.

AT Bow-street Police Court, last Thursday, Mr. Horatio Bottomley was summoned before Mr. Curtis Bennett for publishing in *John Bull*, on March 8th and 15th, a scheme for the sale of chances in a certain lottery entitled "The John Bull Derby Sweep." Mr. Muskett prosecuted on behalf of the police. Mr. Bottomley conducted his own defence. After a hearing, Mr. Curtis Bennett said he had no doubt there was an offence which came within an antiquated law, as it had been described, but Magna Charta was antiquated. He would deal with the matter by ordering the payment of ten guineas costs.

THE *Daily Chronicle* companionship held their annual dinner at the Central Restaurant, New Bridge-street, on Saturday, under the chairmanship of Mr. H. M. Lymbery (father of the chapel). After dinner an excellent programme of music was provided. The toasts were "The King," proposed by the chairman; "The *Daily Chronicle*," proposed by Mr. J. G. Lyon, and responded to by Mr. Robert Donald and Mr. J. H. Parham; "The Visitors," proposed by the chairman, and responded to by Mr. Arthur Richardson; "The Printer," proposed by Mr. J. Middleton, and responded to by Mr. W. R. Farley; and "The Chapel," proposed by Mr. G. W. Mascord, responded to by four members of that body.

VELLUM BINDERS AND MACHINE RULERS' PENSION SOCIETY.—This society—distinct from any of the charities connected with the printing and allied trades—has been in existence for upwards of 70 years, and has done excellent work and rendered financial help to those employed in the smaller branches of the trade, and is the only society making provision for both union and non-union men and women. A number of deserving applicants are now in need of assistance, but the society is unable to render help through lack of funds. To augment these a high-class entertainment is being given at the Shoreditch Town Hall on Wednesday evening, 30th inst., and it is hoped substantial support will be forthcoming. The Shoreditch Borough Silver Prize Band, consisting of 40 performers, and several well-known artistes have been engaged. Tickets may be obtained of the secretary, Mr. F. C. Peacock, 17 and 18, Paradise-street, E.C.

THE Manchester district of the Institute of Journalists held its annual meeting on Saturday. Mr. T. Brunskill (Blackpool) was re-elected chairman and Mr. W. Beck (Oldham) vice-chairman for the coming year. Mr. J. Greenhalgh (Manchester) was reappointed hon. secretary, Mr. F. W. Hewetson (Macclesfield) assistant hon. secretary, and Mr. J. M. Holland (Manchester) hon. treasurer. Mr. F. Connell (Stockport) was chosen as the representative of the district on the Council.

MR. SETZUDO SAWADA, Attaché at the Japanese Embassy in London, addressing the Japan Society, said that many women were already employed on the Japanese Press, and he was looking forward to the time when all the journalists in Japan would be women. One of the healthiest signs for journalism in Japan was that the young, well-trained, intellectual men leaving the Universities were becoming the chief contributors to the newspapers.

THE death is announced of Mr. James Bell, the founder and chairman of directors of Messrs. J. and H. Bell, Ltd., booksellers, stationers and publishers, Carlton-street, Nottingham, and one of the most widely esteemed and respected men in that city. Mr. Bell was in his 73rd year, and his death took place very suddenly on Sunday last. The deceased gentleman has spent practically the whole of his business career in Nottingham, having started in business under Mr. Richard Allen, stationer and printer. In 1865 he purchased from Mr. Dearden the bookselling and stationery business in Carlton-street, which he greatly extended. At the time of his death he was the head of the firm of Messrs. J. and H. Bell, Ltd., the well-known printers and manufacturing stationers of Nottingham.

A COMPENSATION CASE.—In the City of London Court, on Monday, before His Honour Judge Lumley Smith, a claim was made under the Workmen's Compensation Act by a layer-on, against Messrs. Kearley and Tonge, Ltd., tea merchants, Mitre-square, Aldgate, E., to recover compensation for injuries sustained in an accident which befel him while working for them. Plaintiff said he worked for the defendants for about 18 months in their printing department, where they did their own printing, when his hand was crushed in the machine. It happened on November 19th, and he went to the London Hospital where he was detained for a day, and he was still an out-patient there. His wages were 16s. 6d. per week. Mr. Passmore, for the defendants, said that the plaintiff was paid 10s. per week until February 10th, when in the defendants view he was well enough to work. Judge Lumley Smith thought the plaintiff was not quite fit on February 10th. Defendants had behaved very well to the plaintiff. He awarded him 10s. a week to that day, and then 7s. 6d. per week until further order. He must get back to work as fast as he could.

TENDERS WANTED.—For the supply of paper, stationery, etc., for the East Indian Railway Co. Particulars from Mr. C. W. Young, Nicholas-lane, London, E.C. By the Overseers of the parish of Plymouth and the Corporation of Plymouth for printing and publishing the borough list of voters and notices, claims, etc., and county lists of voters and for other work. Forms of tender from the Clerk to the Overseers, 13, Princess-square, Plymouth. For printing, stationery, books, etc., for the Tyne Improvement Commission. Copies of schedule from Mr. J. McDonald Manson, Tyne Improvement Commission Offices, Bewick-street, Newcastle-on-Tyne. For the printing and stationery required for the Nottingham gas department for three years. Specimens and forms of tender on application to Mr. W. Garton, Gas Offices, George-street, Nottingham. For stationery for the Rochdale Tramways Committee. Particulars may be had from Mr. J. S. D. Moffet, Tramway Offices, Mellor-street, Rochdale. By the Director-General, Ordnance Survey, for a supply of lithographic printing, tracing papers, etc. Forms of tender from the Officer in Charge of Stores, Ordnance Survey Office, Southampton. For printing the overseers' list, the burgess roll, the Parliamentary and parochial registers, and the register of county electors for the portion of Linthwaite situate within the Parliamentary borough of Huddersfield, for the Corporation. Information from the Town Clerk, Town Hall, Huddersfield. For the general printing required in the town clerk's, the city chamberlain's, and other departments of the Edinburgh Corporation. Specifications may be had from Mr. T. Hunter, W.S., town clerk, City-chambers, Edinburgh.

INSTITUTE OF JOURNALISTS.—The annual conversazione of the London District of the Institute of Journalists was held on Saturday afternoon at the Trocadero. There was a large gathering of members and friends who were received by Mrs. Carruthers, chairman of the London district. Among the artistes who entertained the company were Miss Dorothy Court, Miss Evelyn Clifford, Miss Helen Mar, Miss Jean Waterston, Mr. Harrison Hill, Mr. Haydn Wood and Mr. Arthur Helmore.

ACCORDING to *Kemp's Mercantile Gazette* there were three failures in the printing and stationery trades of England and Wales for the week ending Friday, April 11th, the corresponding week in 1912 also showed three.

THE imports of printing and lithographic materials into China show an important increase, in which the United States has the largest share, chiefly because of the activity of the American Presbyterian Mission Board which has a large selling agency and warehouse and its own printery in Shanghai.

THE well-known authority on library administration, Mr. James Duff Brown, has just issued "A British Library Itinerary," which forms a useful guide to the principal libraries of the country, and is arranged according to centres with a view to facilitate visiting the different localities. The book is published by Messrs. Grafton and Co., of 69, Great Russell-street, W.C.

THE Rhyl Advertising Association, in its yearly report, states:—"There is no doubt that the newspaper advertisements have paid handsomely, and we have again proved the wisdom of the continuous advertising, as there has not been a single day in the whole year but we have had applications for our guides. During the winter months there has been no falling off." The Association has decided to use the newspapers more extensively, and has also joined with the North Wales Advertising Board in a scheme with this object.

A NEW specimen book of an attractive and useful type face is issued by Messrs. J. G. Schelter and Giesecke, of Leipzig. The design is entitled Salzmann Antiqua, and the sizes range from 6-point to 54-point. The letter is beautifully cut, and possesses quite a distinctive character. Italic founts to range with the smaller sizes, up to 12-point, are also cast. The specimen book contains a number of examples of display work set in Salzmann Antiqua, many of them being worked in colours, and these give a good idea of the usefulness of the new type.

TENDERS ACCEPTED. — For the supply of a guillotine machine for the L.C.C. tramway printing works, W. H. Lockett and Co., Fetter-lane, E.C. For printing 200,000 programmes and 40,000 handbills, etc., for the Huddersfield Greenhead Park Committee, Edwards and Haywood, Exchange Press, Fox-street, Huddersfield. For the supply of account books for the Southwark Borough Council, Messrs. Ash and Co., Southwark-street, S.E. For the supply of newspapers to the Folkstone Town Council W. H. Smith and Sons; books, T. E. Walmsley. For the printing and stationery required from April 1st for two or four years, for the Corporation of Wallasey: C. Birchall, Ltd., 17, James-street, Liverpool, printing, bookbinding, etc., for 12 months; Gledsdale and Jennings, 1, North John-street, Liverpool, stationery, etc., for 12 months.

TRADE MARKS IN JAPAN.—According to the *Board of Trade Journal*, H.M. Commercial Attaché at Yokohama, reports that he has been informed by the Director of the Japanese Patent Bureau that, in future, trade marks consisting of letters of the alphabet or numerals within ordinary squares, circles, etc., will not, as a general rule, be registered. This decision has been come to because letters of the alphabet and numerals are commonly used by merchants to indicate the quality of the articles, and are therefore not sufficiently distinctive or conspicuous for trade marks; exceptions may be made in cases where they have a special meaning or are very effective from long use in distinguishing the merchandise. The Commercial Attaché adds that this ruling is of some importance inasmuch as in the past there have been many cases of the registration of letters and numerals.

MESSRS. RAPHAEL TUCK AND SONS, LTD., have issued some further interesting additions to their popular "Oilette" series of picture post cards. "Trunks full of Fun" is a humorous set, cleverly depicting elephants in human attire at the seaside, and is just issued in time for the coming season. "Ye Younge of ye days of Olde" is the title of a quaint set of humorous cards designed by G. E. Shepheard. A gem of this month's collection is the series of cards representative of dog humour by Lawson Wood, which will doubtless prove a continuous seller. "Carnations" is a very choice series of flowers in baskets and vases. A picturesque series of view post cards of "Florence" are after the original drawings by Mr. H. B. Wimbush. A charming series of figure studies in hand-coloured photographs, is called "Fancy Free," and "How to be happy though married" is another humorous set of "Glosso cards" for the youngsters.

QUADS.

[We do not necessarily identify ourselves with any opinions of our contributor. At the same time, readers will not need to be assured that he always endeavours to communicate something worthy of attention.]

"I hold every man a debtor to his profession, from the which, as men do of course seek to receive countenance and profit, so ought they of duty to endeavour themselves by way of amends to be a help and an ornament thereunto."
FRANCIS BACON, Baron Verulam.

A "filler" feeling makes us wondrous kind, to everyone but ourselves. The feeling that one must—simply must—take on that "filler" job in order just to keep the machine wheels going round.

o o o

It would be well to be more afraid of one's filler and less afraid of one's "fellow." Less afraid of that "fellow round the corner," who is believed to be ready "to take on work at any price." Very likely he isn't, if the truth is known. It's worth while at any rate to try to get acquainted with him. He can be reasoned with.

o o o

One of the most hopeful features of the Costing Congresses that are now being held is the greater disrepute into which the filler tends to fall.

o o o

It is being increasingly recognised that there is an extreme danger that once a job is taken at a price too low to yield a profit, that too-low price will stereotype itself, or at any rate will recur.

o o o

Besides is it not the actual experience that fillers are often dearer to execute in the very slack times than they would if the works were busier?

o o o

And as "fillers" are tending to be regarded in their proper light, so, I say, are "Fellows." One of the most interesting not to say surprising developments of these Costing Conferences is the frank offer of large printers to place their knowledge and experience within reason, and perhaps a bit out of reason, at the service of smaller printers who may care to avail of their help, for the purpose of installation of a correct and satisfactory costing system.

o o o

Colonel Wright Bemrose makes this offer in regard to Derby printers. Mr. Forman makes the offer in regard to Nottingham printers. I have no doubt like offers elsewhere have been made or will be made.

o o o

The cynic can easily suggest that there is an axe to grind in the offer, and that this is all looking towards the elimination of the little man. Similarly some cynic printers refrained some years ago from sending any electrotyping to be executed in the then newly established foundry of the King's Printing House. Was it likely they were going to let other printers find out who their customers were? Certainly it hardly seemed a logical or sensible thing to do.

o o o

Life is full of illogical things, and of things that ought not to succeed but which nonethe-less, somehow or other, do succeed.

o o o

This was one. In practice, what happened was that the foundry of the King's Printing House, being run practically as a separate business, proved to be properly solicitous for its own success; and so, quite apart from its ethical standard, which I am sure is high, it would never have risked the loss of its own plate-making customers by talking to the printing side of the firm as to what trade jobs were in the foundry.

o o o

Moreover the printing side having jobs enough of its own and a conscience of its own, was not inviting or troubling about any such information even if it could be obtained.

o o o

So it came about that any printers who may ever have doubted in the matter, found that after all they could perfectly trust their plates to be made by a rival printer; since nothing terrible ever happened.

o o o

Just one other word regarding the part which the comparatively small printer is to play in this matter. I hope and believe he will be very much benefitted by knowing more accurately where he stands. He is certainly receiving a great amount of light upon printing operations through the speeches of one and another and through the informed and informing answers to questions which are such a feature of the different Congresses.

o o o

His self-respect will prompt him, I am sure, to bear his share of the very considerable cost of this movement. Let there be no misunderstanding. No one has asked me to give any such hint in the matter. But from what I have heard there is just the possibility that some printers, and even some large printers, may in this regenerative movement, be tending to miserably do just what they barely must, instead of doing all they can in lending a hand. They may be still more miserably tending to do nothing.

o o o

What is that alleged Yorkshire sentiment—that libel upon Yorkshiremen?—

Hear all, see all, say nowt,
Eat all, drink all, pay nowt,
And if thee does owt for nowt,
Do't for theesen (thyself).

o o o

A good parallel with the other alleged Yorkshire toast: "Here's to me, and my wife's husband, not forgettin' mysen."

o o o

It may be somewhat sharp to get all these benefits and subscribe nothing. If so, once again I say that what we want is not sharp men so much as broad men sharpened to a point.

o o o

When in Scotland I heard a lament that provincial printers had for years been living on the charity of London master printers so far as the burden of maintaining the organizations of the trade was concerned.

o o o

The Costing Committee must not be left to carry through all the eighteen-months-long elaboration of a system, and then all its exposition, and then sustain all the work and worry of financing the campaign.

o o o

Let each master printer "do his bit" towards the cost, sending in, I suggest, to the secretaries, 24, Holborn. I repeat, no one's asked me to give the jog; only things I've heard suggest that it may be the word in season.

o o o

"There may have been mistakes in my life," said Algernon Sydney, "but I will say there has been no meanness."

o o o

Verb. typ. sat.

o o o

Another hint. Get at it. Follow it up in earnest. And at once. I hear that in the district around Nottingham, it seems likely that the different local Associations of Master Printers will severally each be engaging some accountant, someone not too set in years and ideas, to act as its secretary; with an expectation that he will thoroughly study the costing system, and be of professional assistance to the individual members of that particular branch.

o o o

Again I hope to hear of many cases of printers putting their heads together to facilitate the bringing down of Mr. A. C. Roberts, the London accountant and Auditor of the Federation, and virtually the originator of the system which with modifications is now adopted by the Committee.

o o o

Another exceedingly hopeful feature of the campaign is the frankness with which the labour point of view is being canvassed. Mr. Austen Leigh, in Edinburgh, and Colonel Wright Bemrose, at Nottingham, and Mr. H. A. Clarke who read a very able paper at the Nottingham Congress, have made it quite clear that this is no movement directed against labour, but is a movement directed against 'labour in vain"—to use Mr. Clarke's happy phrase.

o o o

Colonel Wright Bemrose's words on the matter were very sagacious. He reminded the Congress that the trade embraced all the workers in the trade. And certainly a trade has no right to consider itself prosperous whose success does not reach down to its least paid workers.

o o o

Colonel Wright Bemrose impressed that the costing reform advocates have nothing to hide. If they improved the trade as a whole they would have to, and would be willing to improve the position of those who worked for them. He advised that printers before they started a cost installation in their works should consult with those they employed, and he was sure that their confidence would be returned.

o o o

Wise and manly words which should go far to obviate misunderstanding, and assist to a very substantial all round gain.

FRANK COLEBROOK.

You have an unusual opportunity to reach the Office Equipment Dealer, Retail Stationer, and Purchasing Agent—through ONE medium—the

Inland Stationer

The BUSINESS EQUIPMENT JOURNAL.

An examination of the magazine itself shows you why.

The Office Equipment Dealer and the Retail Stationer subscribe to it because it handles the selling end of their lines in a business like manner. Every issue contains articles of sales plans of real practical value.

The Purchasing Agent subscribes to it because it keeps him in close touch at all times with the latest and best developments in business equipment.

You can reach all three with ONE advertisement and at ONE price by using ONLY *INLAND STATIONER*—BUSINESS EQUIPMENT. Let us send you some important facts.

An Anglo-German Exhibition.

Next month is to witness the opening, at the Crystal Palace, of an exhibition that, it is hoped, will help to create a better understanding between the peoples of Britain and Germany, and mark the commencement of a new era of commercial intercourse between the two countries, as well as show the great extent of their respective resources in trades and manufactures. The exhibition has the support of the London Chamber of Commerce and kindred bodies in Great Britain and Germany, and has for president the Duke of Argyll, with nearly the whole of the nobility of the kingdom as patrons. The Committee of Jurors is to be appointed by the London Chamber of Commerce, under the presidency of Sir Albert K. Rollit, and awards of gold, silver, and bronze medals and diplomas will be made to exhibitors whose manufactures show outstanding merit. It is hoped that there will be a good display of machinery, and the Inventions Section is to be a special feature of the show, while favourable terms are to be granted to inventors to induce the presence of the latest developments in mechanical science. There is a section devoted to printing and stationery, and working exhibits may be arranged for. The usual attractions for the public in the form of side shows, sports, etc., are being prepared, and this summer the Palace, which has been rather in the background of late, should attract sightseers in plenty, especially as there is a promise of a better railway service.

The Foulis Exhibition.

The memory of Robert and Andrew Foulis, the famous Glasgow printers of the eighteenth century, is being honoured in their native city this week by an exhibition of the work of the Foulis Press, and of other examples of printing that are of interest owing to their connection with the history of printing in Glasgow. The exhibition, which is in five sections, is being held at the University buildings, Gilmorehill, the first section illustrating printing in Glasgow between 1638 and 1742, the second that of the Foulis Press proper, while a third section is devoted to the work of Alexander Wilson, the celebrated typefounder; a fourth section contains relics of personal interest relating to the Foulis family, and the fifth section is illustrative of the Foulis Academy of Fine Arts. The exhibition was opened on Saturday by Sir Donald Macalister, the Principal of Glasgow University, who in the course of his remarks said that Robert Foulis, in 1741, established himself as a bookseller in premises within the College. He was subsequently joined in business by his brother Andrew, who took the active charge of the retail department. The book shop was a pleasant lounge and meeting place for students and others who were interested in books. Having established himself as bookseller, Robert Foulis next turned publisher. He had no press of his own, and had to depend upon others, but was evidently resolved to produce good work and to place Glasgow printing upon a higher level than it had hitherto reached. In 1743 he was in a position to publish a list of 17 "books printed and sold by Robert Foulis, bookseller in Glasgow." In the same year he was appointed University printer. Dr. Murray also referred to the association of Foulis with Alexander Wilson, the typefounder, and went on to say that the firm of Robert and Andrew Foulis year after year issued a large number of books, some of them such as had hitherto been attempted only by an endowed press, and many of them of great beauty. The great Homer, in double pica and all the majesty of a folio page, was produced in 1756 and 1758—the "Iliad" in two volumes in the former, and the "Odyssey," likewise in two volumes, in the latter year. For beauty as well as for accuracy those splendid volumes could hardly be surpassed; they were, it was said, "one of the finest monuments of Greek typography which our nation possesses." As a printer Robert Foulis had achieved success and had carried the art to great perfection. The exhibition will remain open until the end of next week, admission being free.

* * *

Marking of Exports to France.

The British Chamber of Commerce in Paris calls attention to the following new important French Customs regulation:—By a Customs circular dated February 28th, 1913, the French Customs Administration state that, in future, all imported goods bearing the name of a foreign house having a branch in France must be also marked *Importé* followed by the country of origin. Thus, for example, a British house, "John Brown and Co.," possessing a selling branch in Paris, cannot put the mark "John Brown and Co.," even without address, on the goods sent to such branch unless the words "Importé d'Angleterre" are added.

* * *

Stationers' and Paper Manufacturers' Provident Society.

We are glad to see from the seventy-third report of the committee of the Stationers' and Paper Manufacturers' Provident Society that there is an increased membership, and a steady advance in the invested funds. The latter stand as under: General Fund, £39,132; Residence Fund, £6,674. During 1912 annuities and grants from the Residence Fund, funeral allowances and temporary assistance amounted to nearly £878. As a trustee, in place of the late Mr. Edward Percy Barlow, the committee has appointed Mr. Peter Wood Holden, one of the directors of Messrs. Wiggins, Teape and Co., Ltd. At the recent

Digitized by Google

annual meeting the chairman (the Right Hon. Alderman Sir T. Vezey Strong, J.P.) pointed out the excellent provision which the Society afforded its members, and urged the desirability of young men connected with the trade joining, not merely that they themselves might share in such provision, but also because, should they not need its benefits, they would have the satisfaction of feeling that they had been the means of bringing help to others who might not have been so fortunate as themselves in the battle of life. Full particulars may be obtained of the hon. secretary, Mr. J. A. Cotton, 66, Cannon-street, London, E.C.

A newspaper association has been formed for the control of sporting advertisements, practically all the chief sporting papers and many general papers, both daily and weekly, are represented. Tipsters' advertisements have been vetoed, and several bookmakers' announcements have been modified in style.

A Printing Trade Union Chronicle.

Those of our readers who are interested in the rise and progress of printing trade Unionism in America should try and procure a copy of Part I. of Volume II. of the Annual Reports of Labour Statistics for New York State, published by the State Department of Labour at Albany, N.Y. The title suggests a dry mass of tabulated figures, but the volume in question contains nothing of the kind. It is a history of that well-known organisation, New York Typographical Union, No. 6, and is a very complete and exhaustive "study of a modern Trade Union and its predecessors," compiled by Mr. Geo. A. Stevens, the senior statistician, under the direction of the Commissioner of Labour for the State, Mr. John Williams. The work is, in reality, much more than its official sub-title given above indicates, being actually a connected account of the organised branches of the printing industry in New York City for 135 years, *i.e.*, from the dawn of American Independence down to date. The volume contains an immense amount of detail, filling upwards of 700 closely printed 8vo. pages, with numerous portraits, groups, and other illustrations. Many well-known personages, such as Horace Greeley, were more or less connected with New York printers' labour organisation in its early days, and the story of—for instance—how Greeley alternately patronised and fought the labourites is very interesting reading. In fact, the volume is one eminently worthy of perusal by all who are associated with the organising of labour in the printing and allied industries. It may be mentioned that amongst the most energetic of such organisers in New York, at the end of the eighteenth century, were two young Scotsmen, George and David Bruce, who about 1813 gave up printing for typefounding, in which line they subsequently achieved both fame and fortune.

The annual dinner of the Foreign Press Association in London will take place on Wednesday, April 23rd, at the Hotel Cecil. M. J. Coudurier de Chassaigne, London correspondent of the *Figaro*, will take the chair.

Financial.

Offices of the *British and Colonial Printer and Stationer*,
58, Shoe Lane, London, E.C.
Wednesday, April 16th, 1913.

THERE have been considerable displacements of cash during the past week, but funds have remained ample in the money market, though money was a little more wanted yesterday. The discount market has weakened, though the tendency has steadied latterly. Bullion movements have resulted to date in a net influx of £619,000, the bulk of which is bar gold. The general tendency of stock markets has been satisfactory. Monetary conditions and the prospect of an early reduction in the Bank Rate has had a good influence on the Gilt-edged Section. Consols have steadily improved, and the quotations now are $74\frac{7}{8}$ to 75 for money, and 75 to $75\frac{1}{8}$ for the account.

A firm tone has been maintained in the miscellaneous industrial market, but business is as restricted as ever. There have been few movements in the section relating to paper and print. Associated Newspapers Pref. have risen 3d. to 20s. 9d.—21s. 3d.; S. Hildesheimer and Co. have dropped $\frac{1}{8}$ to $\frac{1}{8}$—$1\frac{3}{8}$, and Mansell, Hunt, Catty and Co. are down $\frac{1}{8}$ to $1\frac{3}{4}$—$2\frac{1}{4}$ xd. Business has been done during the past seven days in Amalgamated Press Pref. at acc. 21s. 6d.; in Associated Newspapers Pref. at acc. 21s. and 20s. 9d.; in Cassell and Co. at acc. 98s. 9d. and 97s. 6d.; in *Country Life* Pref. at 17s. 6d.; in John Dickinson and Co. Deb. at $101\frac{1}{2}$ and $100\frac{1}{4}$; in S. Hildesheimer and Co. Ord. at acc. 19s.; in Ilford Pref. at 19s. 6d. and 20s.; and in the Ord. at 14s. 6d.; in *Illustrated London News* and *Sketch* Ord, at 3s. 6d., 4s., 3s. 9d. and 3s. 6d.; in the Pref. at 13s. 9d., and in the Deb. at $6\frac{3}{4}$ and $6\frac{3}{4}$; in International Linotype at acc. $80\frac{1}{4}$, 83, 80 and $80\frac{1}{4}$; in Edward Lloyd Pref. at 22s.xd. and 22s.; in George Newnes Pref. at 15s. 9d., 15s. 6d. and 15s.; in Spicer Bros. Pref. at $9\frac{7}{8}$ and $9\frac{1}{8}$; in Weldons Ord. at 32s. 6d., and in the Pref. at 19s. 9d.; and in Wyman and Sons Pref. at 14s. 3d.

DIVIDENDS AND REPORTS.

Lamson Paragon Supply.—The report for the year ended January states that the profit was £33,420, to which must be added £3,580 brought forward. After providing £7,183 for reserves for depreciation and for directors' fees there remains £29,816. The directors propose to pay a dividend on the ordinary shares at 10 per cent. per annum for the six months, making $7\frac{1}{2}$ per cent. for the year, placing to investments reserve £1,500, and carrying forward £3,693. All departments of the business have been well employed during the year, and present prospects point to a continuance of these conditions during 1913.

Chapman and Hall.—The accounts of Chapman and Hall, Ltd., for 1912, including £825 brought forward, show a net profit of £3,865. The directors recommend a dividend of $2\frac{1}{2}$ per cent., leaving £353 undivided.

G. W. Bacon and Co., Ltd., for 1912, show a net profit, including £4,651 brought forward, of £4,970, out of which the dividend on the preference shares has been paid and £2,087 written off stock, plant, etc., leaving £1,832 to be carried forward.

Amalgamated Press. — The directors have declared an interim dividend of 30 per cent. per annum (3s. per share) on the ordinary shares for the half-year.

NEW COMPANIES.

Stark, Son and Hamilton (Export), Ltd.—Registered on April 4th, with a capital of £3,000, in £1 shares, to carry on the business of publishers, stationers, lithographers, printers, etc., to acquire the wholesale and export business of Henry Stark, Son and Hamilton, Ltd., of 19, Farringdon-avenue, E.C. COMMERCIAL INTELLIGENCE.

Re JOHN STANLEY,
Paper Merchant.

This debtor described as of Thorneywood-lane, Nottingham, formerly trading as a paper merchant at Forman's-buildings, Sherwood-street, Nottingham, came up last week for his public examination in bankruptcy at the Nottingham Bankruptcy Court. The net liabilties were £100 16s. 5d., and the amount of the assets £24 9s. 6d., the deficiency being £76 6s. 11d. Debtor said ill-health and competition led to his failure. A large firm of paper merchants had obtained contracts with his customers, and he was unable to keep going. The examination was closed.

A WORD OF CAUTION.

In giving the official Gazette information, it must be distinctly understood that we take official records as we find them, and accept no responsibility for inaccuracies, while, as an almost invariable rule, the facts will be found correct. We advise our readers, before forming hasty judgment, to consider that there may be in each case a satisfactory explanation which does not appear on the records.—Ed.]

ENGLAND AND WALES.

DISTRIBUTION OF ASSETS.

WILKINSON, G., late of 99, Lancaster-street, Barnsley, Yorks, retired printer. Claims by April 30th, to Newman and Bond, Barnsley, solicitors to the administratrix.

THE BANKRUPTCY ACTS, 1883 AND 1890.

RECEIVING ORDERS.

WILSON, J. F., trading as J. F. Wilson and Son, 115, Fore-street, London, E.C., printer, stationer, etc. Date of order, April 10th, made on a creditor's petition. First meeting of creditors, April 23rd, 1 p.m., and public examination of debtor, May 27th, 11 a.m., both at Bankruptcy-buildings, Carey-street, W.C.

LEE, D. C., lately carrying on business at 2 and 9, Portsmouth-street, Lincoln's-inn-fields, London, W.C., journalist. Date of order, April 9th, made on a creditor's petition. First meeting of creditors, April 22nd, 1 p.m., and public examination of debtor, May 30th, 11.30 a.m., both at Bankruptcy-buildings, Carey-street, W.C.

NOAD, C. A., 59, Carey-street, Lincoln's-inn, London, W.C., law stationer. Date of order, April 9th, made on a creditor's petition. First meeting of creditors, April 22nd, noon, and public examination of debtor, May 30th, 11.30 a.m., both at Bankruptcy-buildings, Carey-street, W.C.

FIRST MEETING AND PUBLIC EXAMINATION.

BAYLEY, A. L., lately trading as A. L. Bayley and Co., at 8, Bath-street, Bristol, wholesale newsagent. First meeting, April 23rd, 11.30 a.m., at the official receiver's office, 26, Baldwin-street, Bristol. Examination, May 23rd, noon, at the Guildhall, Bristol. Date of adjudication order, April 12th.

NOTICE OF INTENDED DIVIDEND.

KNOWLES, J. N., 103, Vicar-lane, 2, Back Harrison-street, and 18, Reginald Mount, Leeds, printer. Claims by April 29th, to C. S. Holliday, 4, Greek-street, Leeds.

NOTICE OF DIVIDEND.

RICHARDS, T. A., Woodlands, and lately of the "Neath News" office, Ropewalk, Neath, journalist. First and final dividend of 11d., April 25th, at Government-buildings, St. Mary-street, Swansea.

ORDER MADE ON APPLICATION FOR DEBTORS' DISCHARGE.

DAVIES, E., 14, Bridge-street, Llanfaes, The Bulwark and Lion-street, Brecon, and "The Times" office, Merthyr Tydfil, printer and stationer. Date of order, March 12th. Bankrupt discharged subject to the following condition to be fulfilled before his discharge takes effect, namely—He shall, before the signing of the order, consent to judgment being entered against him in the County Court of Glamorganshire, holden at Merthyr Tydfil, by the official receiver, for the sum of £10, being part of the balance of the debts provable in the bankruptcy which is not satisfied at the date of the order, and £1 10s. costs of judgment. Note.—£10 paid to the official receiver in lieu of entering up judgment. The grounds named in the order for refusing an absolute order of discharge were proofs of facts mentioned in sec. 8, sub-sec. 3 (A.), (B.), (C.) and (E.), of the Bankruptcy Act, 1890.

WRENN, E. W., formerly 45, High-street, Alton, Hants, bookseller and stationer. Date of order, March 19th. Discharge refused on the grounds of proof of facts mentioned in paragraphs (A.), (B.), (C.), (D.) and (F.) of sub-sec. 3 of sec. 8, Bankruptcy Act, 1890.

NOTICE OF RELEASE OF TRUSTEE.

DOBBIN, E., formerly trading at 8, St. John's-square, Cardiff, bookseller and stationer. Trustee, H. Jackson, 39, Broad-street, Hereford. Released March 28th.

THE COMPANIES ACTS, 1883 AND 1890.

WINDING-UP ORDER.

THE JAPAN PRESS, Ltd., Malvern House, 9, Byward-street, London. Date of order, April 8th.

The Printers and the Belgian Strike.

The great strike which commenced throughout Belgium on Monday did not include newspaper compositors and printers. The reason for this may be taken as that which induced the Brussels Typographical Association to stand out of the conflict, *i.e.*, that as it was practically certain that one or more journals would manage to come out, by hook or by crook, it would be very unfair to leave the others in the lurch, which is certainly not a very convincing excuse for "blacklegging." Previous to its being adopted, a poll on the question was taken, which resulted in 721 votes being cast for participation in the strike, and 807 against. The majority being so small, a further poll was taken on April 9th-10th, and was much more decisively in favour of abstention, only 559 votes being recorded for a strike, as compared with 982 against. Daily paper hands will, therefore, continue their work as usual, but they will have to pay a "heavy and exceptional levy"—the exact amount of which is to be fixed at a future meeting of the Association—towards the expenses of the strike. Further, they must not execute any work for printers in other branches of the trade, whose hands may happen to be out on strike. The Association is not a very rich or important organisation, having just over 1,600 members, and £760 in hand at the end of last year.

Commercial and art Printing.—Printers who can do good printing, says the *Printing Trade News*, are apt to get the notion that everything they do should be the best possible. The capable man will tell you that it is as easy to do the things right as poorly, but even the best workman recognises that there are different grades of the best. No one will argue that wrappers for laundry soap ought to be printed the way that you would do the wrappers of an expensive scented soap. But the soap manufacturer knows he can sell the same quality at two different prices by the use of a cheap or an expensive wrapper. The successful printer should try to do what is required for the needs of his customer, and not something adopted for them and above their requirements. In a large number of cases business men want commercial printing, and not art printing. They realise that the very poorly printed stuff does not bring business, yet they know, too, that the art printing does not count for very much in results (except for very high-class objects). The printer who will supply this demand and still make a profit is the one who has a chance of building up a large business.

Holding that a lithographic artist could no more be said to be engaged in manual labour than a Royal Academician who painted a landscape, Mr. Justice Warrington has ruled that a lithographic artist and a process engraver, each of whom received over £160 a year, did not come within the provisions of the Insurance Act.

Italy.—The Board of Trade are informed by the Italian Embassy in London, that an international exhibition of wall maps and educational diagrams, etc., for use in schools, will be held at Rome from 6th to 31st May next, under the auspices of the "Associazone per la Cultura Artistica Nazionale." A charge of 20 lire (16s.) will be made for each exhibit. Further particulars may be obtained from the above-mentioned Association at 29, *via* Dogana Vecchia, Rome, where exhibits will be received up to 25th April. A copy of the programme may be seen by firms in the United Kingdom at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall-street, London, E.C.

Birmingham Typographical Society.

Printer's Pie Furnishing Co. Challenge Cup.

A challenge cup having been kindly offered for competition by the above company to the Midland branches of the Typographical Association, two football matches were arranged between Birmingham and Coventry, the first, played at Coventry on March 15th, resulting in a win for Birmingham by two goals to one. The return and final match was played on the ground of the Sparkhill Avondale F.C., on Saturday, March 29th, in very wretched weather. Birmingham having won the toss, played with the wind behind them, and soon after the game was started, Moore netted the first goal, followed shortly after by a nice goal by Osler. Lawrence notched the third point, and half-time arrived with the Birmingham Typographical Association leading by three goals to *nil*. After change of ends, the Coventry team played up briskly, and the Birmingham goal was threatened on several occasions, but escaped disaster. The play was again in the Birmingham favour, Lawrence adding a fourth goal, followed by the fifth from Duddleston, and just before the end of the game, Lawrence finished up by number six. Two penalties were awarded Coventry, but were cleverly saved by Beastall. Coventry were handicapped in losing the services of their clever back, who was injured soon after the game commenced, and did not resume until half-time, but for the clever goal-keeping of Wallis, the score would have been considerably increased. As a result of the match the Birmingham Typographical Association are holders of the Cup for the present year.

The teams were afterwards entertained to tea at the Old Royal Hotel, Temple-row, which was followed by a smoking concert. A most enjoyable programme had been arranged, the following artistes kindly assisting:—Miss May Cleaver, Mr. Pat Barr, Mr. Garbutt, Mr. Harry Flowers, Mr. Bonsall, Mr. Everall (humorist), Mr. Shovell, Mr. Thomas (violin), and Mr. S. J. Rich (banjo), and Mr. C. H. Rogers.

The chair was occupied by Mr. J. J. Atkins, supported by Mr. Sydney Cumbers, of London, and Mr. C. H. Rogers. During the evening the opportunity was taken to present the Challenge Cup Medals to the winning team; before calling upon Mr. Cumbers, the hon. sec. (Mr. J. H. Morgan) gave a short history of the origin and progress of the Football Competition in Birmingham Press *v.* Printers for the benefit of the superannuated members for some 25 years, that had resulted in the handsome sum of about £400 being realised. He explained that Mr. C. H. Rogers, the proprietor of the *Printer's Pie* Furnishing Co., Birmingham, wished to help the members of his old craft, and had very kindly offered a silver cup and medals for competition among the Midland Branches of the Typographical Association, the proceeds of the matches to be devoted to the superannuated members and benevolent funds of the competing branches.

Mr. Sydney Cumbers, before making the presentation, gave an interesting account of the *Printer's Pie* Furnishing Co., in Birmingham, and the success which had attended its efforts, and as one of the "plums in the pie" he had been asked by Mr. Rogers to make the presentation. A collecting box in the shape of a huge pie was handed round for the inspection of the company—a brilliant idea of Mr. Cumbers—resulting in the handsome sum of £3 3s. 6d. being collected for the funds.

The cup and medals won in the Christmas competition between the Press and Printers were presented by the chairman, who referred to the fact that although Coventry had lost the *Printer's Pie* Cup on this occasion, they had set a splendid example of trades unionism, in obtaining an advance without outside assistance.

The medals given to the winners were presented by the Victoria Press Manufacturing Co., London. The cup now is open for competition to Typographical Association branches fifty miles around Birmingham. Those interested should communicate with Mr. C. H. Rogers, 165, Edmund-street, Birmingham, or Mr. J. H. Morgan, Trades Hall, Birmingham.

Printers' Managers and Overseers ASSOCIATION.

MANCHESTER AND DISTRICT CENTRE.

The usual monthly meeting was held on Saturday last, when President Thos. Kirkwood occupied the chair. The minutes of last meeting were read and confirmed, and Mr. Richard Naylor (lithographic overseer. Messrs. Smith, Emmott and Co.), was admitted to membership on the motion of Mr. F. Burnett, seconded by Mr. Geo. E. Shearsmith.

Mr. J. POLLITT (Oldham) read a paper entitled "Bits o' Things," and being a native of "Owdham" was able to talk "Abeawt eawr folk an' other fold, towk i'th Lancashire Dialect." One of his favourite authors is Sam Laycock, who was born and reared in poverty at Marsden, about twelve miles from Oldham, and who earned the title of "The Cotton Panic Poet." At the age of nine he began work in a woollen mill, his hours begin from 6 a.m. to 8 p.m. for 2s. a week; but in spite of such long hours he managed to continue the learning he had already acquired in a school taught by a Congregational minister. At the age of eleven, the family removed to Stalybridge when he got work as a weaver in a cotton mill; he filled this position for six years eventually being promoted to the position of cloth-looker, which position he held for eight years. In the year 1862, in consequence of the cotton panic brought about by the great American Civil War, and which was the cause of so much terrible privation and suffering to Lancashire people, he was out of work, and along with thousands of others he suffered very severely all through that time. In one of his poems, "It's Hard to Ceawer i'th Chimney Nook," he gives a very pathetic sketch of sufferings endured amongst the working classes. Although in such poor circumstances, someone tried to defraud him and he had to enter into a law suit to defend the authorship of "Bowtons Yard," which a literary pirate had printed as his own publication. He obtained judgment and was awarded £5 damages—quite a large sum to him. It was just about this time he came to Oldham, where he had a stall in Tommyfields Market for about twelve months; but this was a very painful chapter in his experience, as business was so bad. He often had to stand a whole day without selling a single book, and used to say if he sold quack medicine and pills, or black puddings, or books on how to make a good "divi," he could have done a rare business. A friend of his, with whom I was very well acquainted, once told him that folks in Oldham did not know of the existence of such an author, whereon he said, "Are folks soa ignorunt i' Owdham." When he left Oldham through ill-health he was presented with a purse of gold. Sam got married and at one of those anxious times that come to most married men, he sat in the kitchen whilst the doctor and midwife were upstairs, he could not keep still, so there and then wrote one of his best poems, "Welcome Bonny Brid," and the humorous part about it is that it was composed for a lad and the new arrival was a girl. Although he was so fond of humour he was of a very devotional nature, as we may see by his "Ode t'th Sun."

Mr. W. H. Swann, a Yorkshire tyke, may be seriously thinking of giving an evening next session on "Yorkshire Authors."

WEE MACGREEGOR.

Lord Rosebery on the Press.

Lord Rosebery was the principal guest at the annual dinner of the London Press Club, held on Saturday evening at De Keyser's Hotel, under the presidency of Mr. Edward L. Goodman, the chairman of the club. In the course of a speech proposing the health of "The Press Club." Lord Rosebery said, "I believe in the power of the Press. I believe in the potentiality of the Press even more. I believe even more in the responsibility of the Press, and I believe most of all that the British Press is the best in the world. But I am not quite sure that that covers the whole ground. There are two other things, I think, should be observed. One is—which is no new one—the enormous monopoly which is now exercised by the Press. The great daily papers have such a monopoly, owing to the enormous cost of compounding new ones, which is obvious to us all. I do not know what the cost is, but I have heard it put at a-half to three-quarters of a million, and even then with indifferent chances of success. Owing to the monopoly which is possessed and exercised by the principal daily papers of this country, their responsibility is greater than the newspaper of forty or fifty years ago. I would point out the great development of the Press. Now every day you produce, not a newspaper, but a library, a huge production of information and knowledge upon every kind of subject.

THE ASHCROFT PAPER TESTERS AND THICKNESS GAUGES.—The latest development in paper testers is a small compact instrument $1\frac{1}{4}$ inches thick, $4\frac{3}{8}$ inches long, and $3\frac{3}{4}$ inches high, which is being marketed by the Ashcroft Manufacturing Co., of New York, well-known manufacturers of instruments of precision for over half-a-century. The paper tester is supplied in two grades, one for testing the strength of thick papers and the other for testing thin papers. In design the instrument is a radical departure from those now in general use, and it is claimed that it will remain accurate for many years without re-adjusting. The firm have also put on the market a gauge for testing the substance of paper and boards. The sole British agents are Messrs. H. B. Legge and Co., of 81, Cannon-street, London, E.C.

BOOKBINDING SECTION.

Bookbinding Notes and News.

Messrs. Nickerson Bros., 99-101, Worship-street, E.C., have been appointed wholesale agents for Great Britain and Ireland for the linen finished bookcloths and buckrams manufactured by the Jos. Bancroft and Sons Co., an American firm whose products have a world-wide reputation for quality. As most of our bookbinding trade readers are aware, the principal features of the Bancroft Co.'s cloths and buckrams are originality of effect, uniformity of colour, finish, and fabric, wearing qualities, tensile strength of fabric, and easy application of decoration (ink and metal). Sample books can be obtained on application to Messrs. Nickerson Bros., who are themselves amongst the oldest firms engaged in the manufacture of bookbinders' leathers.

Messrs. F. Gruneison and Co., of Islington, have hired, on a lease for seven years, three floors of one of the warehouses at Lynn docks. They will use it as a bookbinding factory, in which it is hoped to start work within a few weeks. A quantity of machinery has already been ordered, and the Corporation electricity department has been asked to supply current for lighting and also for motive power. It is understood that the work in the new factory will consist mainly of the binding of cheap reprints, which will be done principally by girl labour.

Employment in the bookbinding trade was not quite as good during February as in the previous month, though a little better than in February 1912. The percentage of unemployed, amongst 3,456 trade unionists in London, was thus 4·9, against 4·0 in January, and 5·7 in February last year. In other parts of the kingdom the percentage of unemployed, out of a total of 2,962, was 3·0 (as in February 1912) compared with 2·1 in January. In London, Edinburgh, and Manchester employment was quiet, and rather worse than a month ago. In London it was better than a year ago. At Glasgow it was good, and better than a month ago and a year ago.

The contracts placed by H.M. Stationery office during February included the following:—Binding, etc., 600 Memo. Books; binding, etc., 2,000 Field Surveying books; binding, etc., 10,000 Army Books 152; binding, etc., 2,500 Insurance Stamp Tables; binding, etc., 1,625 "Vocabulary"; printing, binding, etc., 10,000 books, "England No. 2 Receipt Book"; printing, binding, etc., 10,000 books C. Certificates of Posting; printing, binding, etc., 2,750 Shorthand Note Books No. 9; supplying 7,000 Brown Miliboards.—Waterlow and Sons, Ltd., Finsbury, E.C. Binding 2,166 copies Medical Register, 1913; binding 1,122 copies Dentists' Register.—Dickens and Cooper, Ltd., 6, New-court, Farringdon-street, E.C. Binding 1,150 Rate Books.—Willmott and Sons, Ltd., Bartholomew-close, E.C. Binding 2,500 Priced Vocabulary of Stores.—A. Straker and Sons, Smith Bros., Ltd., Carmelite-street, E.C. Parchments of Various Descriptions.—Cooper, Dennison and Walkden, Ltd., Verney-road, S.E.; W. Cowley, Newport Pagnell; G. J. Dilley, Potton, Beds., and Ashby-road, Canonbury, N.; H. Gibbs and Son, Mitcham; A. Stent and Sons, Havant.

During the first seven weeks following the date when Insurance Act benefit came into force, *i.e.*, up to the beginning of last month, the National Union of Bookbindinders and Machine Rulers paid £139 2s. 8d. in sickness and benefit, and £48 for maternity claims, which thus numbered 32.

Referring to the importance of having trade catalogues substantially bound, a writer in the *Monthly Reminder*, issued by Messrs. Wm. Clowes and Sons, Ltd., says that if the firm who issues the catalogue desires to ensure its being kept for future reference by the recipients, the cover should be strengthened so as to keep the catalogue flat and uncreased; this can be done by lining the paper cover with strawboards, which will keep the catalogue neat and tidy until the back wears off. A far better way, however, is to go to the expense of a cloth cover, and the catalogue will then last clean and bright for years. "A man hesitates to destroy a cloth-covered book, even if he does not anticipate that he is going to make use of it, and will generally put it on a bookshelf, and then should the moment arrive when it will be of use to him, there it is. Again, a few cloth-bound catalogues on a desk or on a bookshelf look very business-like and tidy, while paper-covered catalogues have a habit of never looking smart, and are always in the way. The man who is constantly referring to catalogues always prefers a cloth-bound one, because it is so much easier to handle and opens better. Thus, although the first cost of the cover is more, cloth binding for a good catalogue proves cheaper in the long run, and with it a slightly cheaper paper may be used without detracting from the appearance. Cloth binding has the advantage of lasting longer than paper binding, always looks neater, and is easier to handle. But the manufacturer will say, 'Is it going to bring me more orders to pay for the extra initial outlay?' and to this we can answer without doubt,' and orders from the best class of buyer. Our reason for saying the best class of buyer is that the buyer for a large firm is generally a busy individual, and is therefore the man who will appreciate most a well-arranged cloth-bound catalogue, and use it in preference to any others." These are facts that might well be emphasized by binders when quoting for catalogue work.

The facility of printing on any rough material which the lately introduced rotary lithographic offset process offers has led to efforts being made to print on cloth for book covers, and the result is very successful. Not only have simple one or two colour combinations been done, but also elaborate colour effects in several workings. The colours are quite strong and solid in results we have seen, says the *Stationery World*. This should open up quite a new field for the offset press, and it may be extended to all kinds of textile printing. Whether it would be more successful in this line than the Hayes' process of lithographic textile printing it would be difficult to say. Some wonderful work is accomplished by this process at Letchworth. The impression is made direct from a zinc cylinder, prepared lithographically, on to the textile material. It would complicate the process to apply an offset cylinder, and possibly the result would not show a sufficient gain. The advantage, however, of the process to the ordinary printer is that it enables him to print on cloth without further special machinery—assuming that he has an offset press already installed.

Amongst the tenders received for the supply of annual stores, etc., for the Corporation of Bacup, that of Messrs. Shepherd, Swire and Markham, of Market-street, was accepted for bookbinding.

Amongst the prints on view at the Exhibition of Lithography, which remains open all this month at the L.C.C. Central Schools of Arts and Crafts in Southampton-row, is one illustrating, in the size and colours of the original, the blind-stamped leather wallet which enshrines that well-known volume of 10th century Irish MS. The Book of Armagh. The interlacing strap, work decoration is typical early Irish. In a case in the entrance hall at the School are a few examples of modern fine art binding, in morocco, elaborately gold tooled, executed in the Bookbinding Class of the School. These are well worth inspection by any reader who may be passing that way within the next week or two.

In the current month's issue of the *Englishwoman* M. Marshall has an article on "Bookbinding for Women." It is largely made up of a description of binding processes, coupled with a dissertation on the historical aspect of the craft, but there are several passages of more special applicability to that particular phase of the subject which the writer deals with. The following extract may interest our readers:—"Though the binder's is an ancient craft, older far than printing, it is only within comparatively recent years that it has become open for women to follow, and even now the trade workshops are as jealously closed as ever against female invasion. Women students, it is true, are not absolutely unknown in one or two of the technical schools, but their tenure is dependent a great deal on their ability to hold their own with the male apprentice, who not infrequently resents what he considers as an intrusion upon his sacred rights." The breaking down of the old traditions in this respect is attributed to Messrs Cobden Sanderson and Douglas Cockerell. Dealing with the chances of getting remunerative work when the craft has been thoroughly learned, the writer says:—"There is one almost inevitable question asked by every prospective bookbinder, 'When I have learnt, what chance have I of success?' It is repeated with monotonous regularity at all seasons, by all sorts and conditions, and it is a question quite out of anybody's power to answer. Success as a bookbinder depends upon so many things, but stated briefly it comes to this: If you have strength, an average amount of intelligence, and the wit to use it, a good stock of patience and determination, some knowledge of drawing, and a few kind friends to give you a start, go on and prosper. If, on the other hand, these qualifications are lacking and not to be acquired, then, unless the binding of books is taken up as a hobby, it would be better to choose a craft whose way of success is not so long." One gathers, by the way, that militant suffragettes might make good bookbinders, as one disability from which women learning the trade suffer is said to be utter ignorance of the correct way to handle a hammer!

The attention of the trade has been directed to the fact that in the schedules lately sent out by the Government in connection with the new Census of Production blank books are put in as vellum binding, which is, of course, wrong, the two branches being quite distinct so far as rates and conditions are concerned. It is feared that information given under this heading might be used by the trade unions to secure low class and flush work being handed over to the highly-paid expert vellum binders.

The Master Bookbinders' Associations are actively co-operating with the Master Printers' Federation in dealing with the various binding questions now to the front. Some representatives from them attended the Federation's Council meeting last month in order to give advice as experts, binding being the leading item on the agenda on that occasion.

A book on "Seasonal Trades" (London, Constable and Co., Ltd., 7s. 6d. net.), compiled by various writers, and edited by Messrs. Sidney Webb and Arnold Freeman, contains, in the introduction contributed by the former, a few references to the bookbinding industry. Dealing with the various methods of economising time and labour adopted by employers, it is stated that in extra leather binding men are put on short time in some shops, when the slack season begins, whilst in others a regular staff is always employed, extra hands being taken as needed, in the busy periods of the year, *i.e.*, spring, summer and autumn. August is referred to as being the slackest month in the year in the bookbinding trade, and the fact that there is no "dovetailing" in the work leads to a good deal of temporary unemployment then. Forwarders and finishers cannot interchange, and although the leather binder may take up cloth work, the cloth binder cannot work in the leather shop. The whole subject is elucidated by numerous diagrams, and the remarks on the diverse causes and results of seasonal fluctuations in certain trades make very interesting reading.

At the March meeting of the Library Assistants' Association, Mr. Coutts read a paper on Public Library Bookbinding. He said it was conditioned by wear and durability and also by the paper. Paper had deteriorated since 1890 and deterioration during 1900-1910 had been very pronounced. Mr. Coutts went on to deal with the advantages and disadvantages of tight backs, machine sewing, undue paring of leather, etc. He considered art cloth sufficiently strong for the light novel—light in a physical sense. The speaker dealt also with anomalies in binding specifications, the danger of leaving books in publishers' covers in circulation too long before binding, and spoke highly of the reinforced binding of Dent's "Everyman" series. Mr. H. G. Hayne opened the discussion with a plea for a Co-operative Public Library bindery. He commented also on the "disappearance" of many artificial patent leathers, and thought that corners and edges wore much more quickly than they should do. Mr. Peach spoke of his experience of cloth as being durable and heat resisting. He had also experimented with a mixture of paraffin-wax and linseed oil as a grease for preserving books. Mr. Luxmore Newcombe

Digitized by Google

also spoke of experiments with paraffin-wax as a preservative. Of late years he had used veterinary vaseline, which was very successful. Mr. Chambers spoke against the fad of binding from sheets, which was expensive, and advocated the minimising of the binding bill by buying replacements from the second-hand booksellers, instead of spending the money on binding.

The imports of book cloth during March amounted to 18,710 yards, value £520, as compared with 26,436 yards, value £650, in the same month of last year, and 24,100 yards, value £645, in March, 1911.

The recent Manchester movement for an advance in wages was the cause of a delay in the publication of No. 12 of Vol. 2 of the *Bookbinding Trades Journal* (which is now to hand), because the firm which prints it was one of the few who held out against the men. In addition to the usual items of news, this issue contains a report of two excellent lectures on the "Artistic Tendencies of Modern Book Decoration," which were delivered by Mr. Thomas Harrison at the Annual Conversazione of the Northampton Polytechnic Institute last December. Mr. W. Mellor contributes the first portion of an interesting article on "Modern Fiction: the Novel with a Purpose," and Mr. Geo. A. Stephen, the City Librarian of Norwich, continues his articles on "Publishers' Book-Covers." The present one is devoted to symbolic book-covers, and illustrations are given of Walter Crane's cover-design for his book on "Ideals in Art," and the cover-design of "By the Christmas Fire," published by the American Houghton Mifflin Co. In the course of this article, Mr. Stephen points out that in producing a symbolic book-cover design the artist's object is a dual one: to appeal to the mind by producing a design which will suggest in imagery the subject or spirit of the book, and at the same time to attract and gratify the eye. Symbolic book-cover designs are stated to be found on practically all classes of books, whether scientific or technical, literary or artistic, historical or topographical, philosophical or religious. The symbolism does not always end with the design, for on many covers the colour of the cloth has a symbolic meaning.

A machine for paring the edges of books has been brought out in France by M. I. Votteler, the object being to obtain a continuous cut, together with absolutely neat work. The idea consists in utilising an endless band, in an inclined position with regard to the line of cutting, the machine being furnished with a sharp-edged band running on pulleys. This band runs obliquely over a guide. The books to be pared are placed in a press through the front part of the machine and carried by endless chains, provided with holders, to the band, which trims them continuously. Owing to its oblique position, the cutting band can be guided between cheeks and sharpened during the movement, on the inside.

Employment in the German bookbinding industry was not so good in January as in the previous month, and the percentage of unemployed, amongst 33,185 trade unionists in that line, rose from 2·9 to 3·2. In January, 1912, it was 3·5.

The Book Trades Exhibition to be held at Leipzig next year will contain a section entirely devoted to women's work, which will include a large number of examples of bookbinding. The Federation of German Women's Clubs has the task of forming a Committee, and there is little doubt that the women's section will be one of the most interesting in the exhibition.

The City Council of Elberfeld, Germany, lately decided upon establishing a municipal bindery. Against this strong opposition was raised in the bookbinding industry. At a meeting of the Progressive People's party the cause of the binders was taken up, and a vigorous protest caused the project to be rescinded. It was also brought about that in future only such bookbinding firms as paid union wages and recognised union conditions would be permitted to tender for binding work for the city.

Business still continues good in the Norwegian bookbinding trade. The percentage of unemployed trade unionists, out of a total of 510, was only 0·4 in January, the same as in the corresponding month of 1912.

According to the American *Library Journal* for March, the St. Louis Public Library has established a bindery of its own. About 25,000 volumes are bound annually by various binders in the city, and henceforth this will be reduced until ultimately the work will be carried out entirely in the Central Library. When the bindery is in full operation about fifteen persons will be employed. The repair of rare and valuable reference books, and the binding of such magazines as are in constant demand for reference, will now be given special attention.

The Public Library in Los Angeles, California, recently contracted with a local firm to do its binding work in a special room on the Library premises. During January, 1,692 volumes were sent there for treatment, the result being a saving of £43 on the prices that would have had to be paid under the previous arrangement.

The rebinding of books in American libraries has been worked out almost to a mathematical formula, in which the original cost, the cost of rebinding, the labour involved, the circulation before and after rebinding, are all factors. For 45 cents (1s. 10½d.) a novel which is beginning to come to pieces can be rebound in a strong, half-leather cover, ready to circulate from seventy-five to one hundred and fifty times more. Some of the Eastern libraries are even rebinding the books or reinforcing the books in the original covers before they are placed in circulation.

Col. Roosevelt, ex-President of the U.S.A., is a collector of fine bindings, and has recently acquired a MS. of the Koran, formerly in the possession of the Shah of Persia. Richly ornamented with pearls and other precious stones, the first cost of the volume is thought to have been nearly £30,000. The covers, which measure about ten by four inches, are plates of gold, six millimetres in thickness, ornamented with symbolical reliefs, of Afghan origin. No less than 109 diamonds and 122 rubies are set in these covers, in addition to 168 pearls. The book is preserved in a silver box.

The January-February number of the American journal, *Bindery Talk*, which commences Volume 2, has for its chief contents a continuation of the reprint of the article on "Bookbinding: Modern Methods and Machinery," which appeared in the *Times* Printing Supplement last year; the fifth instalment of the article on "Bookbinding for Libraries," by Mr. W. E. Reavis, which is devoted to "Tubes for Loose-Back Books"; and the report of a lecture on "The Art of Leather-making," by F. N. Moore, which was delivered before the Association of Employing Bookbinders, New York.

A novel use for book covers was mentioned by Dr. Waddell in an article he contributed some months since to the *Asiatic Quarterly Review*. He acted as archæologist to the Tibet Mission Expedition a few years ago, and in that capacity collected large numbers of Tibetan books, many of which have now been deposited in the British Museum. They are mostly very ponderous volumes, made up of large loose leaves, wrapped up in several folds of cloth, and protected by massive wooden boards, carved with various religious symbols, generally painted or gilt. When the Expedition was attacked at Gyantse, a barricade was hastily built up of these books, the bindings of which were so solid as to stop even cannon balls from penetrating into the camp!

Operative bookbinders in Belgium, so long as the strike lasts, have to report themselves every day to the nearest strike committee room, no matter whether they are unionists or not. Meetings to report progress are held on Tuesday and Friday afternoons.

How to Manipulate Gold Leaf.

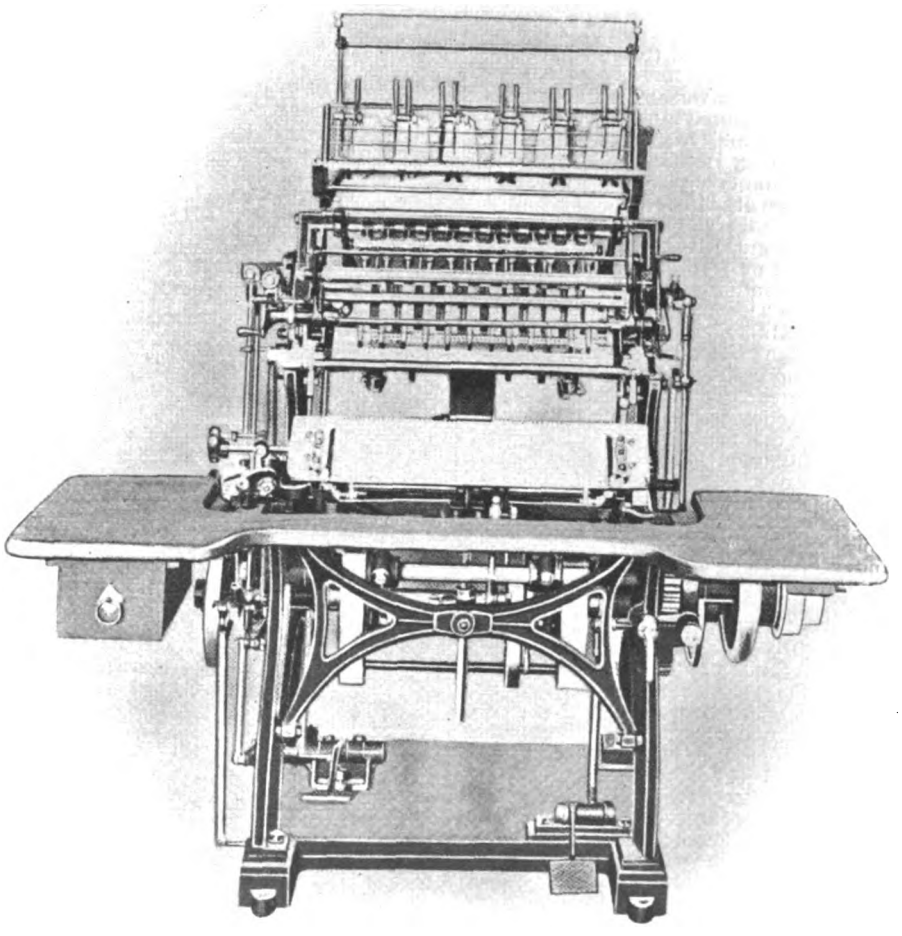
A correspondent recently wrote to the *Inland Printer*, asking for directions as to the best method of handling leaf gold. In reply, the editor said that the leaf could be lifted out of the book by means of a wooden pad the size of the leaf, covered with cotton-flannel slightly saturated with olive oil, and transferred directly to the sized surface, provided the leaf does not have to be cut. If the leaf must be cut, it is lifted out of the gold-book and laid on the leather cushion by means of a gold-knife (a knife or sharpened spatula). After being cut, the gold strips are lifted up on the pad and laid on the material to be stamped. To make the gold adhere to the material, the sized surface may be rubbed over with a little olive oil on a wad of cotton wool. Handling gold leaf is rather difficult. The gold-knife must be brought down with a quick pat outside the lower edge of the leaf, thereby forcing enough air under it to raise it in order to push the knife under. It is then lifted up, carried over and brought down on the cushion with just enough speed—but not too fast—to allow the right amount of air pressure to hold the leaf in a flat horizontal position while depositing. The knife and cushion should be well rubbed over with fine red chalk, to prevent any moisture from adhering to either. If the leaf is wrinkled, or has an edge doubled over when laid down, it may be flattened out by blowing lightly on it from the centre outward. It must be remembered that all handling should be gently but firmly done.

Maps and Plates in Bookbinding.

A problem in modern bookbinding is the placing and locating of maps, diagrams and all similar folded matter. Some method was necessary properly to dispose of them in the most convenient way, that they might be handy for immediate use when required. Various methods were introduced and tried says Mr. R. T. Frailey, writing in the *Inland Printer*, but in some respect or another were always found unsatisfactory. Later the book guard was introduced as a makeshift for the want of something better, and has been in use for many years. The stubs or guards were made in various ways, principally by folding long narrow strips, and then sewing them through the text, each stub being placed so that the map would be approximately located in the text bearing upon it, the thickness of the stub being governed by the thickness of the map when folded.

This method, though still in vogue, is not altogether satisfactory; when it involves a number of maps or diagrams it has a tendency to produce a shapeless book. Guards also have a tendency to weaken the construction of a book, from the fact that they eliminate that solidity so essential to good binding. They are also productive of "starts," which disfigure and ruin the smooth appearance of the front of a well bound book, marring the "round" and creating an unsightly appearance in general, so that the many objectionable features in guard books created a desire for some other method that would retain the map feature intact and at the same time eliminate the guard method.

The most feasible or the most practical method appears to be, on the one hand, the "Pocket or Tuck" method, and, on the other, the "Map Box" attachment, the distinction between the two being that the first is attached to the book, either on the front or back cover, and the latter is independent of the book, forming, as it were, an extra volume of itself.



Blank Book Indexing.

Indexes may be understood either specifically as a table of reference to a book or more generally as an indicator to the position of

Digitized by Google

any given subject; Cicero used the word "table," meaning index, to express a table of contents, the word "index" not being used and only introduced in the beginning of the seventeenth century. The subject of indexing is one which immediately appeals to the intellect as a quick method of ascertaining any information required without delay. Prior to this method of arrangement it was necessary to search page after page in an account book to find where certain information required was located, creating confusion and vexation, to say nothing of the impatience of the searcher; to overcome this embarassment, the idea was conceived of paging and indexing banking and commercial accounts alphabetically, as by this arrangement any account or notation could be immediately located. In time, indexing became employed in almost everything of a literary or commercial nature.

The various terms by which indexes are designated and apply to the several forms of blank books are: first, the "Thumb Index"; second, the "Cut-in Index," and third, the "Extended Index."

By a cut-in index is meant to cut the pages of a book so that the letters of the alphabet will be exposed alphabetically from the top to the bottom of the book, each letter so placed as to refer to certain leaves set apart to record the names or subjects beginning with that respective letter. Each letter of the alphabet has its respective value in commercialism, so that a certain number of pages is always designated in accordance with the value of the letter employed, *i.e.*, in a book of one hundred pages one letter would require four leaves of the index, while another letter would require six leaves or possibly only one leaf, as X, Y, Z, incident to the fact that X and Z have the least value of any letter in the alphabet.

Referring to the extended index, it is understood that the book is not cut at all, but instead the letters are stamped or printed on some material apart from the book and subsequently placed on each leaf where the letter should appear, so that the letter will extend beyond the edge of the book on the front.

Again, the two foregoing indexes are referred to as a "Frontal Index" and a "Cut-Through Index." The explanation of this is: where a book contains principal subject matter in part, and an index is required as a finger-post, the index is placed in the front of the book and rarely requires more than fifty pages. On the contrary, where the subject matter is alphabetically arranged through the book the index is cut through; in consequence of this a table has been arranged which is practically universal, designating the number of pages required for any given number of leaves in a book. In printed matter the method of indexing is materially changed, and a specific number of pages for each letter eliminated, in lieu of which the subject matter designates the number of pages required, such as Bibles, catalogues, books of reference and others of like nature. In books of this character the Thumb index is used in preference to the "Cut-in" or "Extended Index."

The "Thumb Index" is cut differently from that used on blank books, and in shape represents a half-moon, deriving its name from the fact that it is made to fit the thumb in using. This form of index is made by a gouge and hammer in the manner of stone-cutting. It is used principally upon Bibles, designating the different books comprising the Scriptures. This form is also frequently used on books of reference.

Again we have what is termed the "Division Index," to which the alphabetical index is subsidiary, *i.e.*, blank books are made to contain division matter pertaining to aggregated matter on the whole; where this occurs, each division requires an extended index designating the division to which it pertains, and a "Cut-in Index," alphabetically arranged for each, thus simplifying and economising time in every particular. There are many minor forms of indexing, such as "Date Indexing," "Numerical Indexing," etc.; a strict observance of the foregoing, however, will govern this.

To index a blank book properly a standard scale should be followed, the form of which should be so constructed as to designate each letter and its relative value to the number of pages the book contains. A scale covering books from twenty-five to six hundred pages will convey an intelligent idea for proper indexing. Where a book of fifty pages and over may be designated by the relative value of any given letter, it differs where only a twenty-five page index is considered; that this may be overcome as much as possible, the last three letters of the alphabet are placed on one page, and an extra page given to such letters most frequently used. It frequently occurs that a lesser number of leaves than twenty-five are used for an index in front, and in such cases the letters are divided according to their respective value and placed from two to five letters to a page.

It sometimes happens on a "Cut-in Index" that the texture of the paper will not have sufficient strength to sustain an index. In this event each letter should be reinforced with white muslin placed on the back of the page upon which the letter appears, using paste as glue will soil the paper and the same clean result cannot be obtained.—*American Printer.*

DER EXACTE BUCHEINBAND, by Paul Kersten. 2nd edition. W. Knapp, Halle A/S., Germany. 6s. 6d.

"But hark! the cry is KERSTEN, and lo! the ranks divide."

A German handbook on correct bookbinding by Paul Kersten, whom we consider the German Cobden Sanderson, ought to be good—and it is in many respects. For painstaking thoroughness it stands high, even among painstaking and thorough Germans. The minutest detail receives closest attention, and the statements are usually backed by cogent reasons, even when they are not shared by the majority of the author's fellow-craftsmen. But pioneers are entitled to be in a minority, especially if backed by authority. We are glad to read in the preface to this second edition that the author deemed it advisable to exchange the French "Exactitude" for the half German "Exactheit." Why not "Genauigkeit? Perhaps Duden's dictionary would suggest Germanisms for such terms as: "Maroquin," "Ecrasée," "Propagiere," "Shirting," etc. We wonder what Germans think of the hybrid: "Ebarbée-Oben-Schnitt," those very Germans who are so successfully replacing foreign terms in every walk of life by good German ones. Even "Capitalband" and "Maculatur" might be replaced by words as homely to Germans as our "headband" and "waste paper" are to

us. This book is ostensibly written for the professional workman and small master, but without the 101 "short cuts" of workshop experience no man could hold his own in open business competition with Mr. Kersten's formulas alone. To wit, Fig. 15, p. 37, shows how "graining-up" of morocco should be done with the fingers, though the use of a convex piece of cork would do it much better in a fraction of the time. The use and value of flexible glue for backs is not even mentioned. Of course, there are slips of the pen in the best of works. For instance, imitation bands are *not only* a traditional habit, but act as a guard to the panel gilding. To let bound-in wrappers hinge on paper instead of fine linen guards is also an obvious slip. But when the author uses the epithet "nonsense" (Unsinn, p. 30) with regard to the merit of French joints *versus* German, surely the button must have fallen off the foil unawares. A most valuable adjunct to the book is L. Sütterlin's chapter on Design and Designing. We feel it is pervaded by a delicate and artistic instinct, coupled with an all-round grip and insight into the difficulties and possibilities of practical execution. The hints on blending of colours and grouping of form are particularly valuable to art students, in fact what that chapter does not contain for the guidance of a young aspiring craftsman is hardly worth considering. As stated in the preface, this book is chiefly based upon the French style of binding, so we have hardly a right to expect what one looks for from Mr. Kersten as one of the chief exponents of the foremost school of purely German art. The art of book decoration, being a minor branch, has to lean and draw upon the styles and designs of its more important relations, chiefly architecture. The Moorish, Egyptian, Saracen, and Indian book decorators found their examples in the doors, windows and panels of their mosques, and the Persians of the sixteenth century in the inimitable carpet designs of the fourteenth and fifteenth centuries, when the gems produced by the Shah's subjects outshone those of his master, the Padishah. For the last 20 years Germany has evolved a style of architecture and decorative art purely its own, and we should expect that German book decoration would carve out a destiny also purely German. Up to the present there seems to be no such trend of development, but time is young yet, and the next generation ought to feel called upon to evolve a purely German style. The numerous and useful examples given on the 47 plates vary little from those seen in any first-class booksellers or bookbinders shop window in London or Paris. There are many and good samples of useful paper. We wish the book many more and still further improved editions.

Tabulation of Bookbinding Data

FOR ESTIMATING PURPOSES.

By Harry A. Maddox.

Bookbinding is undoubtedly one of the most difficult branches of the printing and allied trades to estimate for with any degree of certainty. When quoting for letterpress or litho work, more or less fixed and timeable factors are being dealt with, as the labour on setting, make-ready and running may be estimated pretty near the ultimate truth, and although the figuring of ink in pounds is a somewhat tricky proposition, owing to the variance of paper, hardness and absorbency, on the whole the operations in these branches are well defined and fairly simple to quote for.

Bookbinding, whether stationery or letterpress, presents a totally different aspect. Many minor operations, performed on different machines, by various workers, lead the way to the ultimate production. Anything like 20 to 30 different kinds of material may be consumed in the binding of a very ordinary book. Again, the times on the job may vary greatly according to the size and class of order in treatment, while the different styles in which the binding may be performed considerably affect the labour values on the job. The binding estimator daily encounters quotes which apparently have no recent parallel in quantity, thickness and style. In many cases he goes over the whole ground of detailing every item of labour and material on almost every quote he executes. The repetition of this procedure is time-wasting, except in such instances as it is absolutely unavoidable. In big tenders it is always wise to tot up the individual items, even if the contract is an exact repeat, for it may happen that leakages and short charges will be detected, whilst increased labour costs and overhead expenses may require to be accounted for. In other directions, however, much estimating energy may be conserved by the inauguration of an efficient system for collecting and recording certain data. Probably every binder is ready to say that he has his records, but he cannot so confidently assert that they are systematised. If they are not concise, properly tabulated and constantly kept up-to-date, they are valueless, or nearly so, to the estimating and costing clerk.

Accordingly, my purpose is to outline the workings of a card index scheme by means of which all the information necessary to the detailing of costs in bookbinding may be accumulated, classified and kept handy for instant reference.

To commence the system the following are necessary: A card index file with one or two drawers, lock and two keys, supply of good quality index cards, ruled with narrow feints, headline, single cash and quantity columns, and a quantity of distinctive coloured guider cards tabbed to the position deemed most satisfactory. The data to be accumulated will be divided into several broad classifications, which again may be split into sections and sub-sections. The broad classifications consist of:—

1. Bookbinding: Labour and Material Values.
2. Time Rates and Values on Miscellaneous Operations.
3. Loose-leaf Data.
4. Leathers.
5. Various Materials.
6. Manufacturers' Directory.

The actual order of arrangement must be left to the discretion of the compiler of the information, but the above perhaps represents the most rational plan. To denote these six big classes, high projecting coloured guiders will be inserted at appropriate distances through the series of index cards.

The first classification, namely, Bookbinding, Labour and Material Values, will be divided first by lower projecting guiders into the three sections, Stationery, Miscellaneous and Letterpress. Taking these sections in turn, divide Stationery by different coloured tabbed guiders into sizes from foolscap octavo to imperial folio. Again sub-divide these sub-sections into ranges of thickness from 100-leaf to 500-leaf by hundreds, using tabbed index cards. To each position of tabbed cards a sufficient number of cards must be allowed to cover the usual styles of binding undertaken, probably from quarter-sheep to full russia with bands, vellum laced. Allow also an extra card to each size section for the recording of extras, *e.g.*, fitting locks, foot-bands, special indexing, loose covers, brass corners and rims, etc.

The compiler has now to work out in absolutely full detail on the cards the actual price of the material, giving full and exact particulars of every item, so that future estimates which vary in some detail may easily be corrected. Labour values and times in detail must also be added from shop records, no guessing being hazarded, and totals arrived at for the complete job. In time an extended set of cards should be accumulated, showing the costs for various quantities of the same style of book. Comparisons between hand sewn and machine sewn work will naturally be made a speciality.

In like manner work out a set of cards for Miscellaneous Binding, comprising check books, duplicate, triplicate and quadruplicate books, and the cheaper class of work in ¼ cloth, imitation leather, cut flush, turned in, sewn, stabbed, wired, whipped, stitched, etc. To make the necessary classification for rapid reference, first divide the cards by guiders

Bookbinders' MACHINERY and SUPPLIES

We have a very fine range of machinery for the Binding Trade, and solicit your enquiries. We can meet all your requirements whether large or small.

Caxton-Beatrice Blockers

Made in England from the original patterns —not a German imitation. Four supports to head, sliding feed table, powerful inking system.

Caxton Rotary Perforator

For run-through and stop work. Gives a clean reliable, slot-like perforation. Easy to adjust, speedy in operation.

331

into sections such as pads, single, duplicate, triplicate and quad; jobs bound one up, two up, three up, four up, and so on. The second division will be by coloured tabbed guiders into sizes of the ultimate cut job, whilst tabbed index cards in graduated positions will show the various thicknesses from 50 to 500 leaves in steps of 50. To each position of tab allot a number of cards to cover the various styles of binding and classes of material. It is very necessary to work out on each card the exact particulars of material, leaving nothing to guess. Qualities and weights of board, with number of backs out, class of leather and cloth, particulars of perforation and style of numbering, method of sewing and binding, may vary on jobs in many respects similar to each other, to such an extent as to materially affect the cost. In this class of work it is essential to calculate the detail for as many different quantities as are feasible in view of the progressive reduction in cost.

The third section of Labour and Material values deals with letterpress binding, and is treated in very similar fashion to section one, excepting that the sizes will run from 18mo. (6-in. by 4-in.) up to Imperial 4to. (15-in. by 11-in.) and music size. The first division in the card index system will be by means of guiders into sizes, naming both the technical term and also the area in inches. The number of tab positions may be about twelve. The second division will be by tabbed index cards into the various styles of binding undertaken, probably from casing and full cloth up to full morocco extra. Cards must also be provided with each size division for the recording of extras, such as gilt or red edging, affixing clasp or lock, inserting plates, special endpapers, etc. To each position of tab extra cards must also be allowed, so that three grades of binding may be tabulated, from sawn in backs, sewn on slips, to sewn on strings for genuine raised bands. Cognizance should also be taken of the quality of boards, edges, endpapers, and other material, for although in a trade price list of letterpress bookbinding only one standard appears to be recognised, a serious attempt to accumulate exact data must work on more extended and truthful lines.

The second broad classification of data embodies Time Rates and Values on Miscellaneous or Warehousing Operations. Chief amongst these are folding, gathering, collating, insetting, wiring, stitching (hand or machine), perforating, numbering, paging, cutting, punching, eyeletting, holing and cording, map mounting, linen hinging, varnishing, round cornering, etc. Separate index cards should be reserved for each operation, whilst the arrangement of the series of cards is best running in order of relationship. Performances on various sizes and quantities of the individual operations should be recorded, such data being invaluable for comparisons. Folding would run over several cards and could be stepped by means of tabbed positions into sizes of sheet and number of folios, enlightening remarks being added as to the class of machine used, nature of paper, etc. Perforating would also be tabbed according to size of sheet, position and number of cuts, class of machine, comparison between drop-bar and rotary being useful. Records of wiring, sewing, stitching and stabbing, etc., may all be kept according to the quantity worked, number of wires, length of stitch, and class of machine, not forgetting to accompany the time record by the amount of wire or thread used. Numbering may be tabbed as single, double or triple, two, three or four deep, or so many down and across a page, special comparisons being made between the different classes of paper. Paging may be tabbed in terms of single or double paging or folioing and remarks added re-manifold, bank, copying, or account book paper.

Classification No. 3 deals with Loose-Leaf Data, its inclusion depending upon whether such work is undertaken. Under our card index system the guiders will announce the classification while sub-guiders will annotate, firstly, the various materials and separate operation times, secondly the data concerning the actual full totals of times, and materials or complete jobs or various standard styles. The first section will be tabbed to positions in order of mechanisms (running across the file in a series of sizes), locks, creasing, punching, slotting, hinging, lining up, round cornering, indicating lettering, etc. The second section will be guided by projecting cards into current binders, transfer cases, and indices, separated by guiders into order of sizes, then tabbed into series of positions according to quality or style. The data to be recorded is the actual detailed time on various quantities, several cards being used if necessary. Full totals of costs must be worked out.

Classification No. 4 takes the form of a record of Current Prices of Leathers and must always be kept up to present market price, a separate card being retained for each class of leather. The tabulation may proceed in order of quality, each card bearing the date, quantity bought, makers' name, colour and size of skin or hide, and any special observations. Thus the tabs may run crocodile, walrus, seal, morocco, Russia, Anglo, goat, velvet, rough and smooth calf, roan, basil, Persian calf, pastegrain, sheep, skiver, vellum, parchment and foril. If necessary to further efficiency, sub-divisions may be made into colour and grain or design and in certain cases into the various sizes. The series should be carefully brought up to date each month from maker's invoices, for the leather market fluctuates considerably, and if back entries are relied upon estimates may be based on too low a price.

Classification No. 5 requires the enumeration on separate tabbed cards, or the aggregation of different items on the same card, of all the many and varied items of Material used in the bindery, save those dealt with under Classes III. and IV. The tabulation may perhaps prove most efficient if it proceeds alphabetically, as albumen, buckram, cloth, and so on. Strawboards, millboards, gold and silver leaf, elastics, glue, etc., along with all other material of every description, will be included in this section. Sundry observations upon competitive prices, quantity used on certain orders, and, in the case of boards, the number to a bundle or per cwt., may be added to the cards with ultimate advantage.

Finally, we may briefly consider Class VI., *i.e.*, Manufacturers' Directory. It is quite open to the compiler to either make a separate section of this data or to include it on his cards in the other classes. The latter plan has the advantage that it saves trouble and the accumulation of an extra set of cards. On the other hand, the value of the directory may be considerably enhanced when kept as a separate section, by the extension of the data and wider scope for observations. Therefore, if convenient, allow a separate set of cards and tab them according to the materials in question. Arrange the makers' names alphabetically, give postal address, and record full particulars of the firm's capabilities for the goods under question. Space may of course be saved by grouping several classes of allied material under one head.

Early American Bindings.

It is somewhat surprising that the various histories of bookbinding pay very little or no regard to the history of the "bibliopegic art" in America. This fact seems to suggest that the writers concerned shared the prevalent but erroneous opinion that bookbinding as a fine art did not exist in America before the time of William Matthews. In 1907 the Grolier Club, of New York, which has had such a salutary effect on art binding in America, held an exhibition of American bindings which did much to dispel the ignorance that existed regarding such bindings. A descriptive catalogue was published in connection with this exhibition, entitled "Catalogue of Ornamental Leather Bookbindings Executed in America prior to 1850," and as the Grolier Club Catalogues are very rarely to be met with in this country, we propose to summarise the information given in the introduction.

As early as 1636, John Sanders, a binder, took the freeman's oath in Boston, before any printing had ever been done there, and John Ratliffe was employed on Eliot's Indian Bible, which, when published, bore the date 1663. In a petition to the Commissioners in 1664, Ratliffe stated that the binding of these Bibles was "the only incouraging work which upon good Intelligence caused me to transporte myself and family into New England."

"Of the ninety or more booksellers who carried on business in Boston before the Revolution, over thirty had binderies also, attached to their establishments, and a number of them confined their attention chiefly to this branch of book-making."

The earliest American bindings were of the simplest kind. "They were usually well sewed, or tied into beech or oak boards, cut quite thin though not over-carefully, having white paper on one side for end-papers, and then covered with sheep or calf, a small margin of the leather being turned over the edges of the paper-covered side and strongly glued down. This form of binding lasted through the seventeenth century, until, in fact, the introduction of "boards" or heavy pasteboard, and marbled papers. Mottled calf and marbled effects soon came into vogue, following the adoption of these varieties in England, where the fashion got a strong hold, though it had but a brief day in France."

"The sheep-bound books of the seventeenth century are all blind tooled with a simple pattern of one or two fillets forming panels on the covers, and having at the corners the conventionalised flower form invariably found in the books of the same period in England usually ascribed to Samuel Mearne, bookbinder to Charles II. The simple geometrical design was the foundation for almost all of the patterns used on American bookbinding of the seventeenth, eighteenth and early nineteenth centuries. This is no doubt partly due to the fact that in bindings in England during these periods, as well as in France during the late eighteenth century and the early part of the following century, the straight line predominated, interlacing bands, scrolls, and other Italian and early French forms being almost entirely unused." The binding on a copy of Jonathan Edwards's "Treatise Concerning Religious Affections," printed at Boston in 1746, which was exhibited, served as a typical example of the early binding used in New England. This binding, of sheepskin, had blind fillets and roll forming a centre panel, with ornaments at the corners and sides, in imitation of the English bindings of the period.

"The simple blind fillet or combination of fillets soon gave place to narrow gold rolls of the severest form, little more than broad lines, or a narrow Greek meander, double or triple lines with dots and leaves, and by the beginning of the eighteenth century the lines were sometimes replaced by gold-tooled running patterns made up of single tools. By the end of this century lines had become borders, some wide, some narrow, with small corner pieces and centre pieces. By the beginning of the nineteenth century, especially in New York and Philadelphia, the borders had become quite elaborate mixtures of gold and blind tooling, made up of rolls, stamps, and sometimes small tools, with heavy corner pieces and centre ornaments composed of small tools. Later, the fashion, more French than English, of using large blocks for the covers began to have a vogue."

The decoration of calfskin bindings by various processes of colouring, sprinkling, mottling, and marbling became very popular in the United States early in the nineteenth century. Ten examples of these decorated bindings were exhibited, dating from 1802 to 1826, one of which was a copy of The Holy Bible printed and sold by Collins and Co. of New York, dated 1817. In the publishers' advertisement of this edition it was stated that "every attention will be given to have the work bound in the best manner, whether in a plain or elegant style." The volume exhibited was apparently in the elegant style, and is described as follows: "Bound in calf, with wide border of gold fillets, and inner blind rolled border; triangles at the four corners form a large panel, within which is a lozenge, the whole outlined by blind rolls of same palmette design as the border, and by narrow painted lines; small, circular, gold tools at the corners of the figures; in the centre a large conventional rose stained."

"In the arrangement of the ornament on the backs of the books we find the earliest examples broken up into panels, each panel being treated separately in the obvious way of border, corner-piece and centre-piece, more or less elaborated according to the period and the style of ornament then in vogue. It is to be remarked that the titles of many of these books, following a purely American fashion, were often placed in the centres of the backs."

"The bindings of New York, Boston, and Philadelphia of the last half of the eighteenth, but particularly of the first half of the nineteenth century, show very strongly these French and English influences, not only in the single tools themselves, but in the large stamps which were a peculiar ear-mark of Thouvenin and his followers, and which easy method of decoration seems to have had a wide vogue with our binders, some of whom produced very creditable results."

"From what has been said it must not be inferred that the American binder was only a copyist, far from that, and it is to his credit that, while using motives frequently used by his English and Continental brethren, he managed to infuse into his work no small amount of individuality."

FROM a return showing the results of a census of manufactories, etc., in New Zealand, for 1911, we find that the value of printing and bookbinding products was £1,377,926. The value of paper bags and boxes produced was £62,051. These figures are exclusive of the output of the Government printing office, the value of which amounted to £89,293.

The Illustrated Poster

ITS DESIGN AND EXECUTION.

A paper on this subject figures in the proceedings of the "Industrial Society of the East of France," of which the following is a summary:—

Three points are to be considered in the question of posters, viz., the idea which is selected by the advertiser; the execution of the design by the artist; the wording to be read by the eventual buyer. If the idea and work of the artist are not adapted to the taste of the buyer, his point of view or feelings, the poster has no effect. This is often the case owing to the fact that there is a divergence of opinions between the advertiser and the artist, prosecution of a commercial object possibly being antagonistic to an artistic one, and *vice versa*. Finally both parties come to an understanding and the poster is the result of mutual ideas, the public being frequently forgotten though not negligible.

This is due to the fact that the laws of publicity by posters are generally not known.

The following is an endeavour to define these laws. Everything is a matter of suggestion. Everyone who advertises, especially by means of posters, should try to gauge the thoughts of the public. In order to know how to influence people, advertisers must study the best arguments, the best attractions for customers. Let us see what may be the effect of this suggestion by the poster, which is not a complete method of advertising but more a means of communication than of putting something on the market. The poster will admit of artistic illustration or text illustration. The latter belongs to the wording. In a poster where it is rarely employed it will suffice to find a suitable arrangement of the text. For the artistic poster the main point is to express an idea. There should be a close relation between the illustration and the destination of the product and the illustration, while preserving its artistic spirit should be instructive. It will produce, together with the direct suggestion exerted by what relates to the advertised product, an indirect suggestion by making appeal to persons likely to purchase. It is good to seek originality, but too ingenious ideas must be avoided, and not confounded with the luminous idea which only deserves this name when it really encourages purchases.

Comical or grotesque pictures may distract the attention from what is advertised. Actuality is not highly commendable, because of its not being durable. History and legends may make a poster incomprehensible to the public. Allegory, however graceful, presents great difficulties in application. Imitation or parody of other advertisements is neither elegant nor clever, and is sure to attract attention to a rival product. As regards execution of the poster, all initiative should be left to the artist, who interprets the ideas of the advertiser. All the latter should demand is legibility and perfect visibility.

Legibility will involve brevity of the text.

Visibility can be obtained by use of violent colours and great contrasts.

The question of the position in which the poster is placed and dimensions from the point of view of its object, are of great importance.

Very large posters, to see which you must move to a distance, or very small ones, at which you must stop, lose their effect, as passers-by are not always disposed to stop or walk in another direction.

Machine Rulers, Bookbinders, Printers, and Kindred Trades Overseers' Association.

THE ANNUAL DINNER.

Harmony, geniality and friendship were the predominating features at the annual dinner of the above-named Association, held at the Salisbury Hotel, Salisbury-square, Fleet street, E.C., on Saturday evening. The President, Mr. J. E. Dixon, was in the chair, faced by the Vice-President, Mr. J. Walker, in the vice-chair, and there were also present Mr. C. J. Gray (President, Printers' Managers and Overseers Association), Mr. E. C. Moyce (General Secretary, Printers' Managers and Overseers Association), Mr. F. C. Peacock (ex-President), Mr. E. A. Clifford (honorary solicitor), Mr. A. W. Hunt (treasurer), Mr. Geo. A. Eden (secretary), Messrs. F. L. Williams, F. Arnott and W. Bowie (members from Letchworth), Mr. W. H. Worrall (Watford), etc.

Proposing the toast of "The Association," the PRESIDENT expressed satisfaction at the continued prosperity of the Association and the steady increase in its membership, and sincerely hoped that during his term of office the increase of membership would be maintained. He mentioned that in 1910 their membership stood at 80; to-day he was proud to say it reached 130. (Applause.) The amount of their credit at the bank was something like £200. He thought they would all agree that that was satisfactory progress. (Applause.) There was no need for him to enlarge upon the advantages of belonging to such an Association as this. It not only looked after the material welfare of its members, but it tended to promote that feeling of brotherliness which should always exist in associations like theirs. They were always willing to hold out the hand of friendship to all who would join them. They had done him the honour of electing him president of the Association, and it would be his endeavour to do credit to that position and to do all he could for the welfare of the members of the Association. He asked them to drink to the prosperity of the Association and to the good health of all its members. (Applause.)

Mr. F. PEACOCK submitted the next toast, "The Chairman and Vice-Chairman," and in the course of a humorous speech remarked that Mr. Dixon had been the most successful member in increasing the membership of the Association. But for his exertions it would not be so strong numerically as it was now. He had brought into the Association perhaps almost a third of the members which it now possessed. He was a man who was well known and much respected in the various branches of the trade, and during his year of office they would give him all the support in their power, hoping that he would continue to help them increase the membership of the Association. With respect to their worthy Vice-President, Mr. Walker, he was a much respected member, who belonged to a nationality that was bound to succeed. He was one of their most earnest workers, and he believed was going to be one of the best. He asked them to join with him in wishing their chairman and vice-chairman every success.

The toast having been cordially received, the CHAIRMAN here intimated that the country members had to leave to catch their trains, and Mr. F. ARNOTT, on their behalf, tendered a few words of appreciation of the entertainment. He remarked that the members from Letchworth at first numbered two, last year there were four, and next year there might be six—perhaps eventually they might invite the Association down there. (Laughter and applause.)

Mr. J. WALKER, Vice-President, proposed the toast of "The Visitors." In extending a welcome to them in the name of the Association, Mr. Walker referred to the presence of the President and Secretary of the Printers' Managers and Overseers Association, and said that they looked upon Mr. Moyce more as an assistant secretary than as a visitor, because there was scarcely a meeting at which Mr. Moyce's name did not come up in connection with some matter or other, and he was always trying to introduce new members. He also mentioned Mr. Clifford, their "Solicitor General," who was an institution in the Association. He was really no visitor; he was one of themselves.

The toast was received with musical honours.

Mr. E. C. MOYCE, in responding, said he did not feel like a visitor, and to that extent he felt out of place in replying to the toast. Although he saw few familiar faces, they had received such a cordial welcome that he felt they were amongst great friends. That did not take away from him the duty of formally thanking them on behalf of the other visitors as well as himself for the opportunity of enjoying their hospitality that evening. Speaking more personally as an executive official of a kindred organisation to theirs, and more particularly on behalf of the Printers' Managers and Overseers Association, with whom his friend, Mr. Gray, their President, was associated there that night—(applause)—he thanked them very sincerely indeed for the honour they had done them in inviting them to be with them on that occasion. He was envious of the fact that they had got in the first shot, because he thought it was up to them as the older Association to have had those who were now their hosts with them first. However, that was to their hosts' credit, and he thought that considering they had presented their eighth annual report it was not devoid of shame to either society that they had not been in more complete touch before. (Hear, hear). He hoped that was over, and that they would see at their next annual dinner their hosts' President and Secretary, at the very least, there to enjoy themselves as much as Mr. Gray and he were enjoying themselves that night. Mr. Moyce then referred to the friendly correspondence that had been carried on between their secretary, Mr. Eden, and himself, touching the feeling of a little jealousy between the two associations that had existed in the past, and expressed the fervent hope that it was now wiped out. He spoke of the defects of great associations, and of the advantages of smaller associations in the greater amount of comradeship that was possible, and pointed out the disadvantages of a small section in an association with a membership of 600. There was plenty of room for both of them, and let them help each other as much as they could. They could extend to each other, as two distinct associations, even far better help than they could if they were all together.

So far as the P.M. and O.A. was concerned, they would be delighted at any time to welcome any of the members of the Machine Rulers, Bookbinders, Printers, and Kindred Trades Overseers' Association at any of their meetings, and they would make them as welcome as they had been made welcome that night. (Applause).

Mr. C. J. GRAY also responded, expressing the pleasure he felt in being with men who were struggling to do what they could for the betterment of the particular branch of the trade in which they were interested, just as the P. M. and O. A. were, and concluded with some remarks about the instruction of the lads in their workshops, and a hope that they as an Association would take an interest in their technical training, and endeavour to do something for the lads passing through their hands.

The last toast was "The Stewards," Messrs. F. Cordingley and J. Fleming, proposed by Mr. J. KNIGHT, who said they had worked splendidly in conjunction with their Secretary, Mr. Eden, who, although he kept in the background, was "a jolly good worker," and so with the chairman's permission, he would couple his name with the toast to "The Stewards," thanking them all for the successful evening they had been the means of securing. (Applause.)

Mr. FLEMING briefly responded on behalf of the stewards, and Mr. GEO. A. EDEN also returned thanks, expressing the pleasure it gave him to see their friends, Mr. Moyce and Mr. Gray, with them. He thought it was a healing of a breach that had occurred in the past, and would not occur again in the future. (Hear, hear, and applause.)

A capital musical programme was carried out during the evening, under the direction of Mr. J. Fleming, and comprised pianoforte solos by Mr. Eric Wilton, who also acted as pianoforte accompanist; charming songs beautifully rendered by Miss Lena Corrie; humorous songs by Miss Florence Bostock for each of which she gained a popular reception; tenor songs by Mr. Stephen Moorcroft; baritone songs by Mr. W. G. Bowie; treble solos sweetly sung by Master G. Lewis; comic songs by Mr. J. B. Cozens; some highly diverting "Nesterisms" inflicted by Mr. John E. Nestor; as well as successful duets by Miss Lena Corrie and Mr. Stephen Moorcroft.

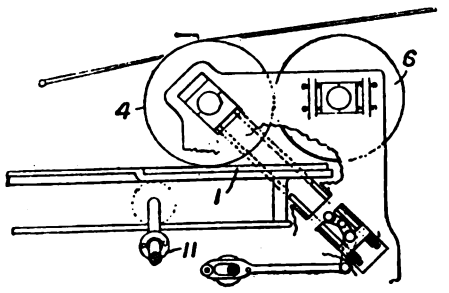
An enjoyable evening was brought to a close with the singing of "God save the King" and "Auld Lang Syne."

BELGIAN
Imports and Exports of Paper.

The following figures show the condition of the paper industry in Belgium, according to *L'Industria della Carta*:—

IMPORTS.

	1911. Kilogs.	1912. Kilogs.
Prepared Papers ...	1,813,913	2.082,393
Cardboard	4.937,278	5.492,631
Other Papers	17,869,206	22,297,110



EXPORTS.

	1911. Kilogs	1912. Kilogs.
Prepared Papers ...	1,587,755	1.919,773
Cardboard	1,077,038	1,290,075
Other Papers	61,364,925	61,275,702

THE partial destruction by fire towards the end of 1911 of the Government Printing Offices at Rio de Janeiro, it is now discovered has involved the loss of not a few statistical records. Meanwhile the annual commercial review published by the *Jornal do Commercio* has been of great value.

Cylinder Machines.

A patent by the Southgate Machinery Co. relates to a multi-revolution multi-colour cylinder machine of the kind described in Specification 28,302, 1908, having a printing cylinder 6 to engage with the impression cylinder 4, which engages with the bed 1, the tripping movement of the impression cylinder is inclined so that the cylinder 4 is moved simultaneously from the bed 1 and the cylinder. The cylinder 6, which may be of

any desired size relative to the cylinder 4, has its axis about on a level with that of the cylinder 4, and the bearings of the cylinder 4 slide at an angle of about 45 degrees to the vertical, but preferably slightly less, so that the movement towards the surface of the flat bed is greater than that towards the cylinder 6, to equalise the impression pressures. The machine may be run as a simple rotary machine by disconnecting the coupling 11 to the bed-driving gear and speeding up the cylinders 4, 6.

Subscribers desiring information as to the taking out of Patents are invited to write. Letters to be endorsed "PATENT DEPARTMENT," Office of the "British and Colonial Printer and Stationer," 58, Shoe-lane, London, E.C. Telegrams: Stonhill, Fleet, London.

Applications.

7,809 CONAN, W., and PRESTON, J. R., card for card index purposes.
7,833 HANCOCK, E., machines for treating paper.
7,885 TURNHAM, A. E., apparatus for the display of announcements, advertisements and the like.
7,922 SONNENBURG, E. J., loose-leaf binders.
7,941 JONES, P., loose-leaf binders.
7,976 SAGERS, H., envelopes.
8,990 LORD, W., envelopes, stationery and newspaper wrappers and the like.
8,059 MICHELIUS, G.m.b.H., and STEIN, R., machine for affixing and cancelling postage stamps.
8,112 HERSCHELL, J. M., clips for use as pencil holders and the like.
8,113 HALLADAY, W. E., clips for check books used by tradesmen in warehouses, shops, and for the like purposes.
8,131 MARKS, E C. R. filing apparatus.
8,165 FAIRBROTHER, H., intaglio printing machines for first form and counter-proof printing or for colour printing.
8,197 ANDERSON, A. C., method of advertising.
8,205 BRIGGS AND CO., LTD., and ABERCROMBIE, C. M., production of transfer designs and such like on paper or the like for transfer printing.
8,210 HYDE, A. C., manufacture of pen-nibs and the like.
8,212 McBRIDE, H. G., cardboard boxes and the like.
8,226 MITTON, E., locking-pin device for securing sheets of paper together or the like.
8,253 SINCLAIR, W. G., machine for making paper bags.
8,259 HOLMES, W. J., pencil sharpening device.
8,286 HEDGES, A. E., machine for supplying and affixing postage stamps to letters or other similar postal packages.
8,316 BETTLE, P. H., pencil sharpeners.
8,351 WALLS, J. A., pencils.
8,402 HILDESHEIMER, H., and JACKSON, J., advertising cards, show cards, and the like.
8,494 BUSE, O., and LINGEMANN, E., folding device for use in machines for the manufacture of envelopes, paper bags and the like.
8,518 DENNIS, E. T. W., process for the production of the reading matter of a newspaper or sheet, or any other printing of reading matter without the use of type.
8,620 DENNIS, E. T. W., typewriting machines for the special application of them for producing transfers of printed characters as a substitute for metal type.
8,626 SHINE, S., manuscript books.

ONE WEEK'S OUTPUT OF STEREO METAL.

TO TRADE BOOKBINDERS, BOOKBINDERS' PLANT AND MATERIAL MANUFACTURERS AND DEALERS, PUBLISHERS, LIBRARIANS, AND OTHERS INTERESTED IN THE BOOKBINDING INDUSTRY.

THE Publishers of the *BRITISH AND COLONIAL PRINTER AND STATIONER* have pleasure in announcing that an ILLUSTRATED MONTHLY SECTION of that journal is now devoted to matter concerning the BOOKBINDING TRADES.

All branches of bookbinding are dealt with, from practical and technical standpoints, and the historical and artistic aspects of the industry also receive attention. Illustrations of hand-tooled bookbindings and publishers' cases which are remarkable for their artistic design, their historic interest, or their novel character are presented from time to time.

The BOOKBINDING SECTION appeals to all those who are interested in bookbinding, whether as a trade or as an art, as all phases of the subject receive their due share of attention in its columns.

The Editor will welcome any news of trade interest that may be sent him, and is prepared to consider original articles of a technical and practical character, with a view to their publication. Information concerning the working of the technical classes in bookbinding, and notices of meetings of trade unions and other bodies associated with the bookbinding industry, are also invited; arrangements can usually be made, if desired, to report the latter, as well as lectures, etc., for the BOOKBINDING SECTION. Illustrations and particulars of new machinery and appliances, and information concerning new materials and methods for use in the trade, are likewise of interest. The publishers having no end to serve save the presentation of matter of value to the various branches of the trade, the pages of the BOOKBINDING SECTION are open to all, employers and employed, unionists and non-unionists, for the free discussion of trade matters.

As far as READERS are concerned, copies of those issues of the *British and Colonial Printer and Stationer* that contain the BOOKBINDING SECTION will be sent regularly on application, at special rates.

With regard to ADVERTISEMENTS, the bookbinding trade announcements are placed in a POSITION NEXT TO OR FACING READING MATTER in the BOOKBINDING SECTION. ADVERTISING RATES sent on application. Arrangements have been made to circulate the journal in quarters likely to be most productive to advertisers of a return for their outlay, and no effort is spared to study the interests of advertisers and readers alike.

Orders for advertisements in and subscriptions to the BOOKBINDING NUMBERS of the *British and Colonial Printer and Stationer* should be addressed to the publishers:—

STONHILL AND GILLIS, 58, SHOE LANE, LONDON, E.C.

The Condition of the Labour Market

IN THE

PRINTING AND ALLIED TRADES.

HOME.

According to the Labour correspondents of the Board of Trade, whose reports appear in the *Labour Gazette* for the current month, employment in the printing trades was fairly good during March, rather better than in February, and better than a year ago. At the end of the month, however, there was a slight increase in the total number of Trade Union members unemployed as compared with the end of February. (See Table.)

Districts.	No. of Members of Unions at end of March, 1913.	Percentage Unemployed at end of			Increase (+) or Decrease (—) on a	
		March, 1913.	Feb., 1913.	March, 1912.	Month ago.	Year ago.
London	21,368	5·1	4·4	6·9	+ 0·7	— 1·8
Northern Counties and Yorkshire ...	5,764	2·7	3·0	6·0	— 0·3	— 3·3
Lancs. and Cheshire	7,200	3·8	4·0	6·5	— 0·2	— 2·7
East Midland and Eastern Counties ...	2,710	1·7	2·0	6·8	— 0·3	— 5·1
West Midlands	2,738	2·7	2·9	4·9	— 0·2	— 2·2
S. and S. W Counties and Wales ...	4,181	4·0	2·3	3·0	+ 1·7	+ 1·0
Scotland	6,037	3 1	4·3	4·7	— 1·2	— 1·5
Ireland...	2,581	6·2	6·4	7·8	— 0·2	— 1·6
United Kingdom	52,579	4·1	3·9	6·1	+ 0·2	— 2·0

In London, employment was fairly good generally, rather better than a month ago, and better than a year ago.

In others centres employment was fairly good, and better than a month ago and a year ago. It was slack, however, with letterpress machinemen, stereotypers, and lithographic printers at Edinburgh, and declined with compositors at Aberdeen and Bristol, and with lithographic printers at Nottingham. With letterpress printers at Dublin employment was rather worse than a month ago and a year ago.

FOREIGN.

In the French printing trades a satisfactory degree of activity prevailed during February, both at Paris and in the provinces. Work also improved in the German printing industry, so that the percentage of unemployed trade unionists out of a total of 66,050, decreased from 3·5 (in January) to 2·7. In February, 1912, it was 2·3. What little change there was in Holland was for the worse, the percentage of unemployed increasing slightly. In Norway, however, no change was recorded.

THE opening dinner of the Postcard Publishers' Association took place on Saturday night at the Holborn Restaurant. Mr. H. J. Kray said that if they did not discourage the vulgar and common postcard the trade was likely to fall into the same decay that the old valentine trade did. The old valentine was a work of art, and costly in production, but the caricature came in and killed the custom. The same would happen with regard to the postcard if abuses were not stopped at the outset. They wanted no Censorship Committees, and they did not want their beautiful productions defaced by the stamp of the censor. He thought they could easily stop the production of such cards as bordered on the vulgar if the authorities prosecuted the publisher as well as the retailer.

A Californian Newspaper.

According to the *Fourth Estate*, the *San Francisco Call* is to have a new home, the building having been begun of a twenty-five storey steel and reinforced concrete building, which will be known as the *Call Building*. It will be the tallest building in San Francisco, and the quarters which the *Call* will occupy in the structure are expected to constitute the finest newspaper plant in the world.

The building will have a frontage of 100 feet in Market-street by 200 feet in Fourth-street, with a frontage also in Stevenson-street. Mr. Spreckels recently purchased the property on which the building will stand for $1,100,000, paying the highest rate per front foot ever paid for San Francisco real estate.

The *Call* will move from its present offices in the Claus Spreckels building at the south-west corner of Market and Third-streets into its new and permanent home about June next year.

The expansion of the *Call* calls for more commodious quarters than are now available in the Claus Spreckels building. That building was not constructed primarily as a newspaper home, but the new building will be adapted first to the purpose of a modern metropolitan newspaper; also for the general purposes of an office building.

The first six storeys of the building will cover the entire area of the property. Rising above Market-street for twenty-five storeys, but not extending over the full depth of the lot, will be the handsome main portion of the structure, crowned with a dome.

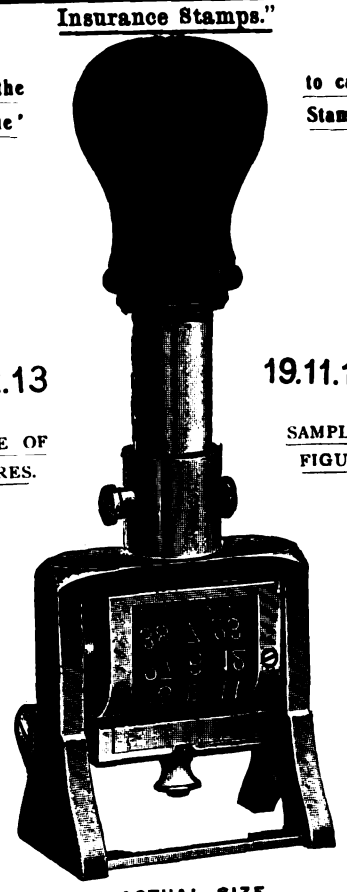
The architects are devoting themselves most assiduously to planning the building as an ideal newspaper plant. A study has been made of the best planned and most modern newspaper establishments of the United States, and the distinctive features of the best plants, together with many new and ingenious details which experience recommends or architect's skill suggests, will be incorporated in the designs.

The site of the new building is in the heart of San Francisco, the corner of Fourth and Market-streets being the busiest corner in the city.

BLOCK printing, at one time a flourishing industry in Ispahan, though hard hit by the competition of cheaper imported goods, is still practised, and gives employment to a considerable number of hands. The designs are stamped in three or four colours (gold is occasionally added), generally on a white ground.

ACCURATE. RELIABLE. EFFICIENT.

National Health Insurance Act.



THE "UNIQUE" DATING MACHINE

Printing the Day, Month and Year in Abbreviated Figures.

"The Right Machine for Cancelling Insurance Stamps."

"Use the 'Unique' to cancel Stamps."

18.2.13 SAMPLE OF FIGURES.

19.11.13 SAMPLE OF FIGURES.

ACTUAL SIZE.

Self-Inking, Clean, Clear Impressions from METAL ENGRAVED WHEELS.

Fitted with gauge to place the date across the Stamp and cancel it, according to the requirements of the Act.

The Quickest Method of cancelling Revenue Stamps on Insurance Contribution Cards.

Easily set for immediate operation.

Price 14/6 each in Box complete.

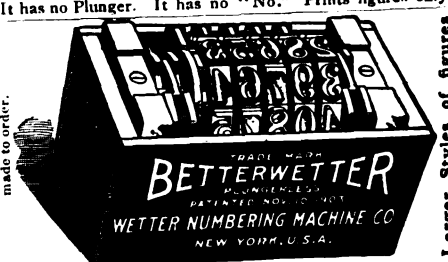
Black Indelible Ink, No. 1 Size, 1/- per bottle.
No. 2 Size, 2/- per bottle.

The ORIGINAL "BATES"

The "WIZARD"

AUTOMATIC HAND-NUMBERING MACHINES.

All steel wheels kept in stock.



THE PLUNGERLESS

"BETTERWETTER"

Automatic Type-High Numbering Machine.

It has no Plunger. It has no "No." Prints figures only.

Safety Bronzing Cabinet

Patent No. 11291/10.

Cabinet Open, and showing Detachable Tray.

Cabinet in use.

BEST QUALITY WORK
NO DANGER TO OPERATOR
NO WASTE OF BRONZE
INCREASED OUTPUT

THIS Bronzing Apparatus has been introduced to enable Bronze Powders, etc., to be applied by hand without any particles of powder floating about the room, or being inhaled by the operator.

It consists, as shown in the illustration, of a box fitted with hinged transparent top and transparent ends. The side nearest the operator has apertures fitted with flexible sleeves with springs to close round the wrists of the operator, so that, although his hands and arms are free to move inside the box, no powder can escape.

The bottom of box is perforated and allows the surplus powder to fall into a detachable tray underneath. The sheets or cards to be bronzed are fed direct from the platen into a narrow horizontal slit fitted with sloping feed board.

This apparatus is made throughout in our own Works, and the edges of the lid and detachable parts are made dustproof. There is no waste of bronze and no injury to the health of the operator, and nothing to wear out. The bronzing is executed immediately under the eyes of the operator, ensuring finest quality work.

JOHN HADDON & CO.
SALISBURY SQ.
FLEET STREET.
LONDON, E.C.

This Cabinet is designed to cope with work up to and including Foolscap Folio in size **Price £3-3-0**

Other sizes to order at proportionate prices.

ACCEPTED BY H.M. FACTORY INSPECTORS. **FACTORY AND WORKSHOP ACT, 1901. This appliance complies with the instructions contained in this Act and which reads as follows: "Regulations 2.B. Appliances so constructed as to prevent as far as practicable the escape of dust into the air of any occupied room."**

"The Editor and Publisher."

Leading Weekly Periodical of the United States devoted to the Newspaper and Advertising Fields.

Presents the Important News of the daily and weekly publications, their editors, managers and staffs. Gives lists of new papers, new incorporations and changes in interest. Prints articles on newspaper management, the latest improvements in printing machinery and methods for increasing circulation. One of its most valuable features is the department devoted to the subject of advertising. Each week it contains "Tips for Business Managers," in which is given the names of new advertisers, lists of old firms that are making new contracts for space, and general news concerning the entire field. Some publishers have secured thousands of dollars worth of advertising through the information thus furnished.

Send for Sample Copy.

Subscription Price $1.50 a year. ADVERTISING RATES ON APPLICATION.

To Distinguish Between Real and Imitation Parchment Paper.

The simplest means for distinguishing the two kinds of paper is, as is well known, the chewing test. Imitation parchment paper when chewed loses its strength and cohesion, real parchment paper does not. It has been asserted that moist imitation parchment paper distinctly shows fibres at the places torn, where as moist real parchment paper when torn will exhibit no projecting fibres. It may however happen that in a real parchment paper the parchmenting liquid has only acted superficially, and, points out Professor Herzberg, in the *Papier-Fabrikant*, the places torn may then present a fibrous appearance and so lead to the erroneous conclusion that one has an imitation. For example, a parchment paper submitted for examination indicated a highly fibrous tear, both when dry and also when wet; on the other hand, the chewing test, the behaviour of the paper when boiled in dilute caustic soda, and the appearance of the fibres under the microscope all showed that the sample was really a parchmented product. Of course this was not an ordinary parchment paper but one of a material made with Japanese fibres and slightly parchmented, the weight per square millimetre being 30 grammes. The average breaking length amounted in the dry condition to 11,675 millimetres, in the moistened condition to 7,050 millimetres. The dilatations were 6·4 and 18·9 per cent. respectively. The moist paper is therefore considerably less firm than the dry, and the notion often obtained when making hand-tests (drawing, pulling, tearing, etc.) under both conditions that moist parchment paper is firmer than air-dried, is a delusion based on the high dilatability and toughness of the moist sheet.

Paper Bags in South Africa.

The United States Consul (Mr. E. A. Wakefield), at Port Elizabeth, reports that the trade in paper bags has been slowly but steadily increasing during the past few years. All paper bags are imported, principally from Great Britain. Nearly all the large imported houses deal in paper bags, with the natural result that no single firm is what would be termed a large dealer. This is in keeping with the usual miscellaneous trading methods of most South African wholesale importing houses. In addition to the wholesalers several of the larger retailers import such bags as are required in their several stores.

The principal local demand is for a medium weight bag, in size from one-half pound to six pounds, and with square bottom. Of course the larger sizes are generally used here, but probably in less proportion than would be the case in the average American city or town.

In grocery, provision and fruit stores the sales unit is as likely to be threepence, sixpence or a shilling (6, 12 and 24 cents) as it is pound, dozen or quart. Because the average individual purchase of most articles is comparatively small, more small paper bags are used.

The total imports of paper bags into this district in the calendar year 1911 were valued at $55,000, of which three-fourths were landed at Port Elizabeth and the rest at East London. Eighty per cent. of these bags were imported from England, and nearly all the rest from America. Sweden, the Netherlands, Germany and Norway exported a few bags to South Africa, but the total was a comparative insignificance, and was a distinct falling off from the preceding year.

Prices, of course, vary according to grade, but in the general trade of the country a medium-priced, plainly-finished, square-bottomed bag is preferred.

Leading retailers in large towns use better grade bags bearing the firm name and other advertising matter. Prices on these vary again in accordance with the amount of printing and decorating. The ordinary stock bag of one of the largest firms (samples under separate cover) sells f.o.b. England at $4.01 per 112 pounds weight, less 5 per cent. for cash. These bags are imported in 200-pound lots, forty parcels to the lot, each parcel of 5 pounds weight. This is the style bag at present in demand, and this price is approximately that of most paper bags stocked in the district. (Samples of these bags may be obtained from the Bureau of Foreign and Domestic Commerce, as well as the names of the leading Port Elizabeth importers.)

As there are so many importing houses, each having its section of local and up-country trade, it would not perhaps be advisable for an American exporter to be bound to one firm solely, except under a contract guaranteeing a satisfactory annual trade.

From conversation with local importers it does not appear that American trade in this community has reached its logical position in the market. Little or no credit is required or desired by the majority of importers, as most large invoices are accompanied by eight or fifteen-day drafts.

100 Years Ago.

Prejudice Against Machine-made Paper.

Included in the extracts from the minutes of the Bible Association formed for Maidstone and District in connection with the British and Foreign Bible Society 100 years ago (published in the *Kent Messenger*) are references to the quality of paper.

We read that on several occasions the Committee were concerned as to the paper on which the Bibles were printed. It was concluded that it was machine-made, and a sub-committee was appointed to inquire whether the quality of machine paper was equal to that made by hand. On December 8th, 1815, the sub-committee said that they had devoted considerable time to examining the Bibles and Testaments issued by the British and Foreign Bible Society, in order to ascertain the sort and quality of the paper. They very carefully examined some Testaments that had been three years in use in the Lancasterian School. They found these to be printed on machine-made paper, and in a very bad state indeed considering the little use they had had. Some were literally falling to pieces owing to the badness of the paper, although something might be attributed to the method of binding. Next, the sub-committee carefully examined some of the Bibles and Testaments distributed by the Society three years previously. These were found to be of the same description as those just mentioned. In one case the sub-committee made a comparison with a Testament which had been in constant use nearly eight years, and, being of different paper, it still appeared to be in a good state of preservation. The sub-committee were, therefore, of opinion that the Bibles issued by the Society were made of such paper as was not desirable, and that in all probability in a few years they would be having complaints from the purchasers. They accordingly recommended that steps be taken to lay the subject before the parent institution, and the sub-committee were authorised to extend their inquiries and to draw up an address to the premier Association. In pursuit of their inquiries the sub-committee communicated with the Brompton and Gillingham, Tonbridge and Sussex Associations, asking as to their experience in the matter, and pointing out that machine-made paper "appeared to be deficient in strength to hold the stitches used in binding."

The sub-committee were evidently thorough in their investigations, for their report was not brought up until February 28th, 1817, when the proposed memorial to the committee of the parent Society was presented. In the course of this memorial it was stated:—"It appears to us but too evident that there does indeed exist a most material defect in the texture of the paper on which the Bibles and Testaments of the Society are printed, and which defect we are decidedly of opinion arises from the peculiar mode of its manufacture—that is, its being made by machine and not by hand, and we think it will evidently be seen by you, from an inspection of the books herewith sent, that the machine paper is so very deficient in strength as really not able to sustain the bearing of the thread by which the sheets are stitched together, the leaves drawing from the back and starting out of place even in carefully using the books. . . . In one district the consequences were so seriously injurious to the Association that nearly all the members withdrew their contributions, and we are fully convinced that unless the evil complained of be effectually and speedily corrected the Society at large will experience incalculable injury; nay, its reputation and usefulness are hereby vitally implicated. . . .

"We beg just to observe," the memorial went on, "that, Maidstone being surrounded by the first paper manufacturers in this kingdom, the defect under consideration is too palpable to escape the notice of these numerous artificers residing among us, and which tends to confirm them in their natural objection to paper made by machines, and we have just cause to fear that as the facts are more known (and there are not wanting many who would gladly exaggerate the evil) it will be extremely difficult, if not wholly impracticable, for this Association to maintain its footing among that description of individuals, who have been here some of its firm supporters; and from our immediate vicinity to such manufacturers we find it to be absolutely indispensible that the article we distribute should be of the first quality. . . . Our General Committee have the making of a new survey of this town and its vicinity, but from our not being at present prepared to meet the complaint we expect to hear of the books already distributed, we think it better to postpone it until we are favoured with your reply, being persuaded you must enter into our feelings in desiring to compensate our poor neighbours for the injury some are likely to sustain, for we cannot acquit ourselves of injustice in selling them at full price an article not adapted to their constant use."

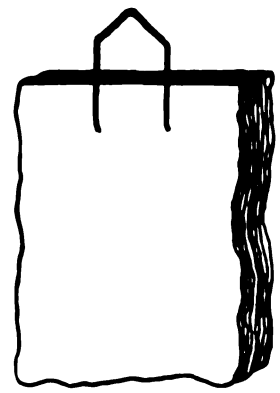
The Committee, in asking for an early reply, also requested that they should be allowed to return all books which were thrown on their hands, and those in stock, which were printed on machine paper.

The reply is dated February 24th, 1817. The parent Society promised to replace the books returned from Maidstone, and to "represent to the King's printers and the Universities (with whom it remains to decide upon what paper shall be used) that it is desirable to adopt paper of a stronger texture in future."

Copper-Plate Printing.

A machine for copper-plate printing has been patented in France by Messrs. L. Dujardin and Co. It is of the same type as those—rotary or not—in which wiping is operated by means of cloths passing over rolls in contact with the plate and loose on their shafts, the cloths being stretched by tightening rolls which act when they come into contact with each other, but only during the passage of the plate under the wiper roll and the plate cylinder, in the case of a rotary press, being displaced with a movement along its axis, during wiping only in such a way as to vary the direction of it.

In the new machine each of the wiping cloths, wound on a reel mounted on a shaft with suitable brake, passes between two stretching rolls, grooved or smooth, one of which, furnished with springs, can be raised when the cloths are sufficiently stretched by means of a set of suitable levers. The cloths run from the stretching rolls to two other reels—the shafts of which are entrained by friction—on which they are wound. The springs of the various parts are regulated so as to assure complete stoppage of the cloth, then stretching and rewinding. The stretching rolls can be brought into contact and then moved away from each other, to act on the cloth at a variable speed, by aid of a suitable mechanism. During wiping the to and fro motion is given to the plate cylinder, in the case of a rotary machine, by means of a cam and a roller, springs lodged in the cylinder and compressed by lugs forming part of a disc keeping the cam on its roller. Finally pressure of the compressing roll against the plate cylinder or imposing surface takes place and ceases owing to an elastic mounting of the compressing roll and a system of keys and rollers fixed on the cylinder or imposing surface and intended to push back the compressing roll at the required moment.



BUKAMA 49

is a patented Fastening Machine, which staples layers of advertising papers, wrapping paper, bags, packets and tear-off blocks up to 15 m/m thickness, and provides them at the same time with a hanger.

Especially adapted for large outputs, 20,000 to 30,000 fastenings per day.

Cheapest hanger arrangement without holes and suspenders, wire used per 1,000 costs about 1¼d. to 1½d., according to thickness.

Trade Notes.

THE Blackfriars Type Foundry, Ltd., have appointed Mr. H. W. McKenzie to be their London and district representative.

THE *Advertiser's Weekly* is a new paper conducted by Mr. J. C. Akerman and Mr. George Warrington, at 34-35, Norfolk-street, Strand, W.C. The price is twopence.

THE BRUSSELS STRIKE.—At the end of last week the newspaper printers in Brussels joined the national strike, but on Monday they evidently thought better of it, and over 700 men restarted their work, the newspapers appearing in their usual form.

ONE of the subjects brought forward at the monthly meeting of the Darwen Trades Council—on which a lengthy discussion took place—was in regard to the *Daily Citizen*, and a motion that a grant from the funds of the Council be made towards the journal was defeated.

THE changes in rates of wages in the printing and allied trades, during the three months ended March 31st, resulted in a total increase of £172 per week in the earnings of 2,569 persons. In the corresponding quarter of last year only 977 persons were affected, the gross increase being £71.

ABOUT five o'clock on Sunday morning last a policeman discovered a parcel, in which was an electric accumulator charged to the extent of three volts, in front of the doorway of the *Yorkshire Herald* office at York. Evidently the intention was to blow up the office, as the machine was in thorough working order. The words "Votes for Women" were found on two pieces of paper and a luggage label inside the parcel.

THE annual meeting of the Bristol Printing and Kindred Trades' Federation was held at the Caxton Rooms, Bristol Bridge. The report for the past year showed that there had been a steady increase in the membership of the affiliated societies. The work undertaken by the Federation had been of a varied and interesting nature, the year being one of earnest activity. The following were elected for 1913: President, Mr. A. Frost; vice-president, Mr. E. G. Shorney; treasurer, Mr. H. Gliddon; secretary, Mr. W. G. Stone.

THERE has been added to the British Museum's Department of Prints and Drawings a collection of wood engravings by the brothers Dalziel. The collection consists of 49 volumes, and comprises the whole of the work of the Dalziels from 1839 till 1890, numbering more than 54,000 engravings. The collection was made by the brothers, George, Thomas, and Edward Dalziel. George died in 1902, Edward in 1905, and Thomas in 1906. The Dalziels were the principal wood engravers for purposes of illustration of the Victorian era.

AMONG the stewards who will support Prince Arthur of Connaught at the Jubilee Dinner of the Newspaper Press Fund at the Hotel Metropole on May 24th next are:—The Russian Ambassador, Sir George Alexander, Mr. Richard Bentley, Lord Biddulph, Mr. J. C. J. Drucker, Mr. John Galsworthy, Sir Robert Hadfield, Mr. Robert Hichens, Lord Mersey, Sir Newton Moore, Sir Owen Philipps, Sir Edward Russell and Mr. C. Scaramanga-Ralli. Those wishing to attend should apply for tickets to the Secretary of the Fund at 11, Garrick-street.

READERS' PENSIONS COMMITTEE.—The twenty-third annual dinner in aid of the Pension Fund will be held on Saturday, May 3rd, at the Holborn Restaurant (Venetian Chamber), when Sir Henry Lucy is announced to preside. Five Readers' Pensions have been founded and placed in charge of the Printers' Pension Corporation. Towards a sixth Readers' Pension 350 guineas have been paid to the Pension Corporation, and it is hoped that as a result of the forthcoming dinner this Pension will be completed, so that it may be awarded at the election next year.

AN IRISH COST CONGRESS.—Following the example of the master printers of the neighbouring island of Great Britain, the Irish master printers are arranging for a cost congress on May 8th next, at the Aberdeen Hall, Gresham Hotel, Dublin. Mr. W. Howard Hazell (Messrs. Hazell, Watson and Viney, London), and Mr. R. A. Austen Leigh (Messrs. Spottiswoode and Co., London), who were the chief speakers at the London Congress, are to give addresses, and, in addition, there will be papers read and addresses given by several of the Irish master printers. Every employing printer in Ireland is earnestly invited to the Congress. Mr. W. G. Hill, Trinity Chambers, 41, Dame-street, Dublin, is the secretary, and he will be pleased to supply particulars to any master printer.

THE Londonderry Corporation have accepted the following tenders:—Stationery, J. Forrester; printing, J. C. Glendinning.

A *Daily Express* gift of a printing press and outfit, value £20, is among the prizes to be awarded at the Imperial Scout Exhibition and Rally, which will be held in Birmingham in the first week of July.

IN order to obtain first-hand information regarding the teaching of various printing processes abroad, Mr. J. C. Smail, organiser of trade schools for boys, is to be sent on a visit to Paris, Munich, Leipsig, and Berlin.

THE Avenue Press, Ltd., Manbey-street, Stratford, have installed a 12-inch "Blackman" fan, driven by a 1-h.p. electric motor through belting in the bronzing-room, for purposes of extracting the powdered bronze in the air from this room. In this instance, both motor and fan are fixed to the ceiling, and were installed to comply with the new Home Office Regulations for extracting bronze dust in works where such is produced. The current is obtained from the main of the West Ham Corporation.

DISSOLUTION OF JOINT STOCK COMPANIES.—A notice appears in the *London Gazette* for the 18th inst. to the effect that, at the expiration of three months from that date, the following companies will, unless cause is shown to the contrary, be stuck off the Register of Joint Stock Companies, and thereby dissolved:—

Colonial Press and West Australian Telegraphic News Agency, Ltd.
Lisle Press, Ltd.
Lombard Press, Ltd.
Motor Finance Publishing Co., Ltd.
New Card Co., Ltd.
Northern Freemason Publishing Co., Ltd.
Nukuv Publishing Co., Ltd.

TENDERS WANTED.—For printing the voters' lists and register of electors for the borough of Lewisham; particulars from Mr. E. Wright, town clerk, Lewisham Town Hall, Catford, S.E. For printing for three years of the assessor's list and register of voters of the county of Aberdeen, and for one year of the supplementary list and register of county council and parish council electors, for the Aberdeen County Council; tenders to Mr. W. Murison, county clerk, County Buildings, Aberdeen. The Director-General of the Ordnance Survey desires tenders for the supply of thin zinc printing plates and litho stones; forms of tender from the Officer in Charge of Stores, Ordnance Survey Office, Southampton. For printing the minutes of the Inverness Burgh School Board for three years; copies of specification from Mr. W. C. Macbean, 42, Union-street, Inverness. For a supply of printing to the Borough of Portsmouth Asylum; tender forms from Mr. E. W. Rogers, clerk at the Asylum. Tenders are invited by the Insurance Committee for the County of London for the supply of card index cabinets; particulars from Mr. Thomas Batey, clerk of the committee, 5, Chancery-lane, W.C.

STATIONERY OFFICE CONTRACTS.—In the House of Commons, the other day, Dr. Addison asked whether any limitation to the number of firms contracting for orders to the Stationery Office is permitted; whether any extension of orders has been entrusted to any firm without their being open to tender; if there is any house doing work in London except Messrs. Willmott, who work under the 50 hours per week limitation, who has secured any orders; and what precautions are taken to avoid the letting out of work to firms which employ cheap women labour and semi-skilled and under-paid binders? Mr. Robertson replied that the only limitation in regard to firms contracting is that they shall be competent as regards establishment, etc., to carry out orders entrusted to them, and that they shall observe the fair wages resolution of the House, which provides for the payment of the standard rate of wages in the trade. In certain special circumstances—for instance, extreme urgency—orders must necessarily be given without specified competition; but in such instances the prices are based upon previous competition. Only those houses in the printing and binding trades in London which work 50 hours a week or under on Stationery Office work are regarded as fulfilling the fair wages clause.

THERE has been a complete change in the attitude of most of the workmen in American printing houses in respect to the cost system. They realise now that it is not a "speeding up" proposition, and some of the more thoughtful ones realise that no plant owner can properly sell his product unless he knows what it costs. They have also seen that the introduction of real cost systems has brought better and more equipment (particularly in the composing-rooms), and resulted in rearrangements so that the workmen are not impeded in their effort to accomplish things without confusion or interference with the other men. These men appreciate working in a well-equipped and arranged office. They do not call a cost system office a "dump."

"WAS your cart stationary?" asked the coroner of a witness at a St. Pancras inquest the other day. "No, sir, provisions," was the reply.

MR. GEORGE ATCHINSON, who for over three years has acted as district reporter in the Alnwick district, has left to join the reporting staff of the *Newcastle Daily Journal*. Prior to leaving Alnwick Mr. Atchinson was entertained by his many friends in the ducal town at the "Plough Inn."

THE proprietors of our Italian contemporary, *Il Risorgimento Grafico*, in consequence of the many requests they have received, have decided to postpone the date fixed for the sending in of the work for the great international competition for the making of a modern book (already referred to in our columns), and have decided to fix the 30th June next as the last day for sending in the work of competitors.

MESSRS. S. W. PARTRIDGE AND CO., LTD., hold an extensive stock of electrotypes, colour blocks, photographs, drawings and illustrations of every kind that are suitable for the illustrating of books, magazines, etc., as well as for circular, booklet, and other work, where the insertion of a suitable cut is frequently the making of the job. The selection covers a wide field of subjects, including social and domestic life, adventure, industrial and rural life, fiction, child life, soldiers and sailors, Biblical incidents and places, historical and foreign, portraits, natural history, landscapes, seascapes, cities, outlines, silhouettes, borders, initials, puzzles, etc., etc. Messrs. Partridge and Co. have also a good selection of three-colour blocks, from originals by well-known artists. The prices are very moderate, and the firm's specimen sheets should be seen by all publishers and printers who require artistic work.

THE May number of the *Windsor Magazine* is a varied and attractive miscellany of fiction by famous novelists and illustrated articles on themes of general interest and importance. Prominent among the latter is a pictorial souvenir of the Shakespeare Festival now being held at Stratford-upon-Avon, which includes some two dozen portraits of the many well-known players taking part in this year's celebration. Among the plates are excellent portraits, in various rôles, of Mr. F. R. Benson, Director of the Festival, Mr. Arthur Bourchier, Miss Violet Vanbrugh, Mrs. Benson, Miss Nancy Price, Miss Dorothy Green, Mr. Murray Carrington, Mr. F. Randle Ayrton, Miss Eve Titherade, Miss Ethel McDowall, Miss Jean Sterling Mackinlay, and many others. The fiction of the number includes the latest complete episodes in Halliwell Sutcliffe's charming new romance, "The Open Road," Justus Miles Forman's fascinating new series, "The Six Rubies," and the further experience of the late Robert Barr's widely-popular young millionaire, Lord Stranleigh. Among other authors who contribute complete stories, grave and gay, are Keble Howard, Edwin Pugh, Edgar Wallace, E. F. Spence, and John Barnett.

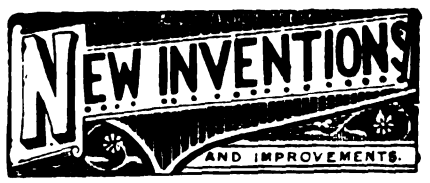
A Printing Press Action.

Linotype and Machinery, Lim., v. the Miehle Printing Press and Manufacturing Co., Ltd.

This was an action for an injunction against the defendants, and came on for hearing before Mr. Justice Swinfen Eady, in the Chancery Division, last Thursday.

Mr. Ashbury, in opening the case for the plaintiffs, said there were two defendants, both of the same name, one an American company and the other an English company, with limited liability. His Lordship had the matter before him on a former occasion, when the American company moved to discharge service on them out of the jurisdiction on the ground that they were a separate and independent company, and had no concern with what the English company were doing. That motion failed. The claim in this action was to restrain both the defendant companies from dealing in what were known as Miehle presses or any similar cylinder presses, or from otherwise competing with the plaintiffs in such goods in England and certain colonies other than Canada, also to restrain them from soliciting former customers of the first defendant company, who sold to the plaintiffs the goodwill of their business in these presses; also to restrain them from dealing in or interfering with any inventions assigned by an indenture of March 3rd, 1899, or any articles constructed in accordance with the patents and from entering into competition with the plaintiffs in respect of these inventions; and, lastly, to

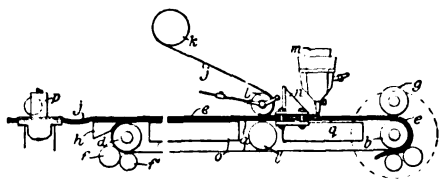
Digitized by Google



restrain the defendants from selling machinery or printing presses in the name of Miehle. Plaintiffs asked for an injunction to restrain a breach of five agreements under which they purchased the rights of the American company. Council entered at length into the various points of the agreements, and had not finished his opening when the Court rose, and the case was adjourned.

At the resumed hearing, on Tuesday, evidence was led for the plaintiffs. Mr. William Henry Lock, director of Linotype and Machinery, Ltd., said, in 1898 he was manager and secretary of the Linotype Co. In 1902 he was appointed a director of the Printing Machinery Co. The Linotype Co. was a manufacturing company, and their goods were sold by a company called the Machinery Trust. In 1898 there was a printing machine in this country called the Century machine, which was manufactured by the Condor Agency. The Miehle press was being handled by a firm called Gow, on behalf of the Miehle Co., and in 1898 the Linotype Co. were minded to acquire the Century machine, and agreements were entered into to acquire the the English Miehle press. The Printing Machinery Co., Ltd., was formed to acquire both the Century and the Miehle presses, and in that way the competition between these two, which was very keen, was stopped. They were sold by the same company in British territory, and the Century was sold all over the world, except the Continent of America. The plaintiff company was formed in 1903 and was an amalgamation of the Linotype Co., Ltd., and the Machinery Trust, Ltd. Have any of your machines been sold in the territories of the defendant company in the name of the Miehle press?—No. The company, continued the witness, had advertised, and very diligently pushed the sale of the Miehle press in this country.

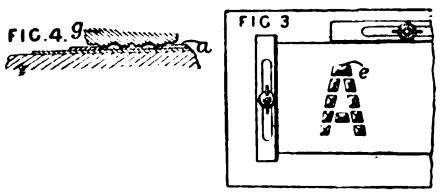
The hearing was again adjourned.



A Cropper Boy's Compensation.

In the City of London Court, on Monday, before His Honour Judge Rentoul, K.C., a cropper boy claimed compensation under the Workmen's Compensation Act against Messrs. J. Isaacs and Sons, printers and stationers, 20, Camomile-street, E.C., for personal injuries which he suffered while working for them. Mr. C. T. Williams, plaintiff's counsel, said that Murphy was employed by the defendants as a cropper boy at wages of 15s. per week. On Thursday, February 13th, he was working at a machine when he got caught in it and he was injured. After having his hand medically treated he came back to the premises and did errands. On the Friday he was paid his 15s. as usual. The following week after the accident he went back and did odd jobs and errands and so on. He got his 15s. at the end of the week and after that he was not able to go to work. At the end of the third week the defendants would not pay the plaintiff anything. On March 17th the present proceedings were brought, and the next day the defendants asked the plaintiff to attend their doctor. The doctor said that the boy could not work and he was paid 10s. a week until the present time. But they would not pay the 10s. for the third week, and that was the ground of the present claim. Mr. A. H. Lionel Leach, defendants' counsel, at the instance of the Royal Exchange Association, said that they had paid everything to the plaintiff except the third week and that was not due. They paid the plaintiff 15s. a week for two weeks when all he could recover under the Workmen's Compensation Act was 10s. a week. Therefore they paid him nothing for the third week because of the overpayment. They had gone on paying him the 10s. a week and would do so while the boy could not work. The Court really had no jurisdiction as there was nothing in dispute. Judge Rentoul said it was an interesting point, in spite of the amount in dispute being small, as to whether the defendants could have credit for an overpayment, when the money was paid voluntarily. Mr. Leach said the 15s. was paid for two weeks by mistake. Surely the defendants were entitled to credit for the over-payment. Judge Rentoul said that the question was whether the defendants had not made a mistake in law in trying to set off the amount overpaid. He had no doubt that the 10s. was due and that over-payments could not count in a case of that sort. But he was afraid plaintiff had not brought his proceedings in the right way. Mr. Leach: Are we to be penalised because we have paid too much? Judge Rentoul thought they were. But plaintiff had not taken the right action. Defendants should have registered the agreement in the first place. Mr. Leach said that the reason the defendants' insurance company was defending the action was to prevent employers having to pay when there was no chance of getting their costs, however improperly they were brought there. Mr. Williams said the registration of the agreement was not obligatory. Judge Rentoul said he would enforce the agreement to pay the 10s. a week. He thought the defendants were not entitled to deduct the 10s. as they had done. Judgment in favour of the plaintiff for 10s. a week and costs.

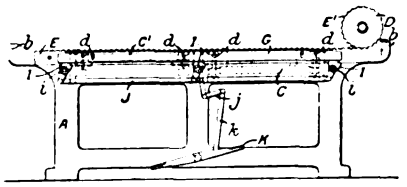
Printing from Intaglio Plates.



A machine for printing in gelatine ink from a printing surface prepared from a photographic gelatine relief, especially applicable for printing kinematograph films, post cards, and the like, is patented by Messrs. Sohier et Cie. The printing band *e* is fed along by an endless band *a*, supported on two rollers *b*, *d*, the band being slightly coated with varnish or other adhesive by rollers *f*, *f*¹, to assist the feeding operation. The printing

band is pressed on to the band *a* by a roller *g* and detached therefrom by a guide *h*. The colour is supplied from a water jacketed reservoir *m* and is spread by an adjustable felt faced frame *n*. The strip of paper, post cards, or film *j* from the roll *k* is pressed into contact with the printing band *e* by a counterweighted pressure roll *l* acting against a roll *l*¹. A hot water vessel *q* is arranged under the reservoir *m*, and a cooling device *o* is furnished to solidify the impression on the film *j*. The film after printing is perforated by a device *p*.

Show Cards, etc.



Mr. J. C. Holloway has patented a method whereby show cards, etc., are formed with shaped perforations disposed in the form of characters and holding a transparent material embossed to produce a jewel-like effect. A backing, Fig. 3, bears projections *e*, which

enter the perforations in the superposed card *a*, Fig. 4. A cutter die *g*, preferably heated, cuts the transparent material, which is laid upon the card *a* and forces its edges into the substance of the card *a*, at the same time embossing the card and producing a beading round the letter.

Cylinder Tripping Arrangements.

This invention relates to offset printing-machines of the type wherein the design is transferred from a flat plate to the member to be printed by a travelling cylinder, and consists in the provision of means for tripping the cylinder. The cylinder D bears on rails formed on the top of the side frames A, outside of which are secured racks E gearing with pinions E¹ on the cylinder. Between the frames are adjustably supported, on screws *d*, a bed C for the stone, etc., and an impression bed C¹. The motion of the cylinder is

limited by the ends *b*. Outside the racks E are two guide rails G which are supported on cams I and are arranged to form tracks for bearing rings on the off-set cylinder. The cams I are mounted on pivots *i*, and connected together by links J which can be moved by means of bell-cranks *j* and links *k* from treadles K at both sides of the machine, by which means the cylinder can be raised clear on its return stroke. Mr. A. J. Ford is the inventor.

ESTABLISHED 1840.

Jacobs Brothers & Co.

SUPPLY

COTTON WASTE, MACHINE RAGS, POLISHING RAGS, DAMPING CLOTHS, &c.

ORDERS PROMPTLY EXECUTED.

Costs and System.

A GREAT deal has been written of late on the subject of costs and the introduction of a system, or systems that would render the business of a printer a little more remunerative than it is at present, and some master printers have even gone the length of characterising such attempts to benefit the trade as a whole as "rot." An American writer recently treating this phase of the matter puts the following questions to such objectors to the general welfare:—"Are there any better, or in fact any other absolute safeguards, to success in any business that is productive? How many articles of manufacture are there which can be safely produced without a thorough knowledge of what it costs to make them and to put them on the market, and how can that certain cost be known without a system? The object of having a system and definitely ascertaining the cost of what is produced is not an invention for the raising of prices for printing, but it is pretty sure to accomplish this if introduced, because it detects the losses or the too meagre profits and compels the moving up of the figures to where they ought to be. A man without a system in the conduct of his business establishment wherein there are many details, is closely related to another man suffering from dementia and he cannot possibly know his costs. There are two paramount reasons why systems are not in more general use in printing plants and they are, first: Many printers have the mistaken idea that there is a big expense attached to the introduction and working of a system and they lay the proposition aside on that impression; and secondly, there are entirely too many printers who think they know about all that it is necessary to know to run their business, and on that conceit they are in a fighting attitude against cost systems. There are thousands of printing plants in the country which have no cost system whatever, their business being done much the same as a pedlar on a corner who sells apples, the only difference being that the pedlar makes nothing except money which many printers fail to make. These thousands of printing plants without systems have every needful in their offices necessary to the use of a cost system but they fail to use them. They have bookkeepers, an office force, and heads of departments and these are all they need to introduce a cost system and get it to work admirably as a little detective which would ferret out all the big and little details of expense and set them up in the total. A good cost system will go through a plant just as the preparation of a prescription passes through the druggist's hands, excepting that the druggist might introduce a wrong ingredient that would be harmful, but the cost system never will. Any other way of conducting a printing business of any dimensions whatever is loose and unbusinesslike; it is guessing and taking chances, and any sane man knows what that is sure to mean in some cases, and perhaps in many. One does not have to be of unfailing memory nor a good guesser to make a living profit out of his business if he can get work and has it done under a reliable cost system. Then why do so many printers stagger at it or give it the place Satan ought to have—behind them?"

* * *

Twopence for the "Times."

AFTER maintaining its price at threepence for over fifty years, the *Times* now announces that after May 5th next its price to the public will be reduced to twopence, a charge that is significant of a tendency on the part of the proprietors to endeavour to permit of its being read by a much larger section of the public than has hitherto been able to consult its pages owing to the somewhat prohibitive price so far as "the man in the street" was concerned. That a reduction in price to the general public was bound to come was foreshadowed by the reduction, in February, 1911, to regular subscribers, who since that time have had their paper supplied to them for twopence daily, and doubtless these same subscribers will expect to be put on even better terms now that the paper has been reduced in price. Certainly the high cost of the *Times* has in the past been detrimental to its circulation, and the reduction to twopence should remedy that. In the notice of reduction the *Times* says: "It is believed that the extension to the general public of our subscribers' privileges will greatly facilitate the circulation of the *Times*, the reduction in cost amounting to no less than £1 6s. per annum. . . . Outside Great Britain, where the *Times* has a largely increasing sale, the price will be lowered correspondingly. For example, the price of the *Times* to-day in Paris is 5d., in future it will be 4d. A change in the price of the *Times* is something of a national event, the last reduction having taken place in 1861." In connection with this subject the following table showing the price of the *Times* at successive stages of its career will prove of interest:—

July	1, 1796 ... 4½d.	Sept.	15, 1836 ... 5d.
Jan.	1, 1799 ... 6d.	July	1, 1855 ... 4d.
May	22, 1809 ... 6½d.	Oct.	1, 1861 ... 3d.
Sept.	1, 1815 ... 7d.	May	5, 1913 ... 2d.

COMMONWEALTH OF AUSTRALIA.

Postmaster General's Department,
23rd April, 1913.

TENDERS are invited for the supply of Sealing Wax, Twine and Envelopes to the Postmaster General's Department in Queensland.

Tender forms and specifications may be obtained from the Office of the High Commissioner, 72, Victoria Street, London, S.W.

(Signed) C. E. FRASER,
Postmaster General.

Early Papermaking.

The first discovery of paper in China according to Dr. M. Aurel Stein, who has published an account of an antiquarian research campaign, was made in 102 A.D. In all probability it dates still further back, as on the site of an old watch tower, on the Western extension of the Great Wall, Dr. Stein found rolls of neatly folded paper, exceedingly thin and brittle, on which were written signs in an unknown, but Aramiac-like script, and Professor Wiesner, the chief authority on plant physiology as connected with the history of paper manufacture, has proved by a microscopical analysis of the material that the documents represent the earliest effort at present known in the production of rag papers. Prior to the introduction of paper, the Chinese maintain that wood and silk were used, and Dr. Stein has found old samples of wooden stationery at a Tibetan outpost, an early seat of Central Asia in paper manufacture.

An Embossing Paper.

By a process patented by Mr. G. Moncany paper is given a surface having the appearance of engraved metal by first coating with a mixture of metallic powder and adhesive liquid, then pressing it, cold or hot, between a specially formed die and a hardened cardboard or leather counterpart, and finally varnishing and re-embossing the surface to give it the required finish or patina. The die is a negative copy, electrolytically obtained, of a metallic plate engraved in the manner required for the finished article. From this die a counterpart is embossed in cardboard or leather, the surface of which has been hardened by a layer of liquid chatterton and sealing wax, or black pitch, and the surface of the counterpart is again pressed after being coated with hot gutta-percha to make it flexible. Single sheets, or several sheets of paper glued or stuck together, may be embossed between the die and counterpart, the metallic paste being next to the metal die and receiving its exact surface. It is next coated with collodion or other varnish that will render it more durable and give it the required patina, and is again embossed; it will then take a high polish.

The Council of the Printers' Pension, Almshouse, and Orphan Asylum Corporation acknowledge a further contribution of £25 from Mr. Cecil B. Harmsworth, M.P.

IF THE MIEHLE WAS NOT SOMETHING MORE THAN A TWO-REVOLUTION PRESS IT WOULD NEVER HAVE REACHED THE PROUD POSITION IT HOLDS TO-DAY IN THE ESTIMATION OF EVERY PRACTICAL PRINTER

It is because it is *the* two-revolution press that the trade buys it.

Design, material, workmanship- all combine to make and keep it the premier machine.

It is built at the Broadheath Works—in itself a guarantee of efficiency.

Financial.

Offices of the *British and Colonial Printer and Stationer*,

58, SHOE LANE, LONDON, E.C.

WEDNESDAY, April 23rd, 1913.

THE Bank Rate was reduced last Thursday from 5 to 4½ per cent., a change that was justified by the strong Bank return, currency having returned from internal circulation, resulting in a gain of £1,123,052 in the Reserve. Money has been plentiful in Lombard-street all the week, and with a small demand loan rates are easy. The weaker tendency in the Discount market changed to a harder one yesterday. Further purchases of bar gold have been made this week, resulting to date in a net influx of £234,000. The tone of Stock markets has been dull this week, and although the reduction in the Bank was received with much satisfaction, it proved to have been previously discounted and price movements were not of great importance. There was a more cheerful tone yesterday, and in certain directions business showed signs of expansion. With peace restored in Europe undoubtedly public interest in markets will increase. The nearness of many new issues checks the gilt-edged market, but prices are firmer. Consols are quoted lower than a week ago at 74 1/16 to 74 1/16 for money, and 74 3/4 to 74 7/8 for the account.

The miscellaneous industrial market has been very quiet this week, movements being very narrow and the tendency unsettled. In the section relating to paper and print Eyre and Spottiswoode Deb. fell 1 to 80—85 last Thursday, and Linotype and Machinery B. Deb. dropped 2 to 42—47 on the previous day. Business has been done during the past seven days in Associated Newspapers Pref. at 20s. 6d., 21s. 3d., 21s. and 20s. 9d.; in Cassell and Co. at 90s., 95s. and 100s.; in Ilford Ord. at 14s., and in the Pref. at 19s. 6d.; in *Illustrated London News* and *Sketch* Ord. at 3s. 9d., 3s. 6d. and 3s. 9d., and in the Pref. at 13s. 9d., 13s. 9d., 13s. 6d. and 13s. 9d.; in International Linotype at 80 and 80; in Edward Lloyd at 22s. 6d. and 22s. 3d.; in George Newnes Pref. at 15s. and 15s. 7½d.; in C. Arthur Pearson Pref. at 66s. 3d. and 60s.; in Raphael Tuck and Sons Ord. at 18s. 3d., and in the Pref. at 98s. 1½d. and 98s. 9d.; in Waterlow and Sons Cum. Pref. at 7 5/8, and in the Def. at 26½; in Waterlow Bros. and Layton Ord. at 6¼, and in the Pref. at 7½; in Weldons Ord. at 31s. 3d., and in the Pref. at 20s.

DIVIDENDS AND REPORTS.

INTERNATIONAL LINOTYPE. — Net profits available for dividend amount to £47,518. Deducting the interim dividend of 2½ per cent. paid on November 1st, 1912, on the then issued stock of the company, there is a balance of £33,640. The directors recommend the payment on May 1st of a balance dividend of 5½ per cent. for the year ending March 31st, 1913, making, with the interim dividend, 8 per cent. for the year, being at the same rate as last year, and leaving a balance of profit to be carried forward to the current year of £3,099. During the year ended March 31st, 1913, the Mergenthaler Linotype Co. (of whose stock this company holds 14,392 shares of $100 each fully paid) has distributed dividends amounting to 15 per cent. on the nominal amount of their issued share capital. The net profit of the Mergenthaler Linotype Co. for the year ending September 30th, 1912, amounted to $2,738,521, as compared with $2,733,269 for the preceding year, while their surplus amounted to $6,765,481.

NEW COMPANIES.

NEW PAPEROID CO., LTD.—Registered on April 12th, with a capital of £20,000, in £1 shares, to acquire any invention relating to the treatment of paper for the production of Paperoid, and other articles in the nature of hardware or otherwise which can be made out of paper, paper pulp, etc., to manufacture and deal in paper, paper bags, cases, baskets, trunks, tea and other chests, barrels, pulleys, drums, panels, wheels, rims, tubes, etc. The subscribers are J. B. Graham and J. A. Gussin. Private company. The number of directors is not to be less than two nor more than five; the subscribers are to appoint the first. Qualification, one share. Remuneration (except managing director) as fixed by the company. Registered office: 6, Broad-street-place, E.C.

BRITISH WASTE PAPER SYNDICATE, LTD.—Registered on April 14th, with a capital of £50, in 1s. shares, to carry on the business of dealers in waste paper of all kinds, etc. The subscribers are T. H. Browton and E. R. Baines. Private company. The number of directors is not to be less than two nor more than five; the first are not named. Registered office: 14, Wilson-street, Gray's-inn-road, W.C.

JOHN TOD AND SONS, LTD.—Registered in Edinburgh, on April 11th, with a capital of £25,000, in 10,400 preference and 14,500 ordinary shares of £1 each, to acquire and carry on the business of John Tod and Son, papermakers, St. Leonard's Mill, Lasswade, Midlothian. The subscribers are: J. D. Tod, Hazelbank, Eskbank, paper manufacturer; J. R. Gray, Dunallan, Eskbank, retired planter; G. W. Stewart, Ardchattan, Eskbank, banker, and Mrs. A. Tod, Hazelbank, Eskbank. Private company. The number of directors is not to be less than three nor more than five; the first are J. D. Tod, J. M. Macpherson and J. R. Gray. Qualification, £250, preferred or ordinary shares. Registered office: St. Leonard's Mill, Lasswade, Midlothian.

ORFORD BROTHERS, LTD.—Registered on April 14th, with a capital of £3,000, in £1 shares, to carry on the business of printers, paper merchants, publishers, stationers, etc., to acquire the business carried on at 15 and 28, Brunswick-street, Liverpool, as "Orford Brothers," and to adopt agreements (1) with G. Orford and (2) with G. Orford and D. A. Reader. The subscribers are G. Orford and D. A. Reader. Private company. The first directors are G. Orford (managing director) and D. A. Reader. Qualification, 200 ordinary shares. Registered office: 15, Brunswick-street, Liverpool.

EXPERT PRESS, LTD.—Registered on April 15th, with a capital of £3,000, in £1 shares, to carry on the business of printers, publishers, lithographers, etc. The subscribers are D. H. Heap and R. E. Gill. Private company. The number of directors is not to be less than two nor more than five; the first are D. H. Heap and R. E. Gill. Registered office: 158, Strand, W.C.

ARDEN PAPERMAKING CO., LTD.—Registered on April 17th, with a capital of £30,000, in £1 shares, to carry on the business of papermakers and merchants, etc. The subscribers are T. Taylor and W. F. Rimmer. Private company. The number of directors is not to be less than two nor more than five; the first are T. Taylor and F. T. Eckroyd (both permanent, subject to holding 1,000 shares). Registered by Jordan and Sons, Ltd., 116-17, Chancery-lane, W.C.

SHOOSMITH AND LEE, LTD.—Registered on April 14th, with a capital of £5,000, in £1 shares, to carry on the business of dealers in household furniture, ironmongery, turnery and fittings, ornaments, stationery, fancy goods, provisions, drugs, chemicals, etc., and to adopt an agreement with P. Shoosmith and R. C. Lee. The subscribers are P. Shoosmith and R. C. Lee Private company. The number of directors is not to be less than two nor more than five; the first are P. Shoosmith and R. C. Lee (both permanent). Qualification, £100. Registered by C. S. Jupp, 49, Lime-street, E.C.

"RECORDER," LTD.—Registered on April 16th, with a capital of £500, in £1 shares, to take over the business and assets of the newspaper entitled the *Recorder* for Palmers Green, Winchmore Hill and Southgate, printed and published by T. Whittingham and Co., Ltd., 10-12, Little Trinity-lane, E.C. The subscribers are F. Whittingham and W. G. Faulkner. Private company. The number of directors is not to be less than two nor more than five; the first are F. Whittingham and W. G. Faulkner. Registered office, 10-12, Little Trinity-lane, E.C.

TRANSFER SYNDICATE, LTD. — Registered on April 16th, with a capital of £15,000, in £1 shares, to carry on the business of printers, lithographers, etc. The subscribers are G. W. Lomax and G. Rowson. Private company. The number of directors is not to be less than two nor more than five; the subscribers are to appoint the first. Registered by Pakeman, Son and Read, 11, Ironmonger-lane, E.C.

COMPANY MORTGAGES AND CHARGES.

Fresh Obligations registered pursuant to Section 10 of the Companies Act, 1907, and Satisfaction registered pursuant to Section 16 of the Companies Act, 1900. (The registration of Satisfaction is not compulsory.)

KENTISH DISTRICT TIMES, LTD.—A memorandum of satisfaction to the extent of £300, on December 25th, 1912, of debentures dated June 25th, 1901, securing £4,300, has been filed.

CLYDE PRESS AND ROTALITHO, LTD.—Particulars of £550 first and £200 second debentures, created April 10th, 1013, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged—the company's undertaking and property, present and future, including uncalled capital. No trustees.

ST. JOHN'S PRESS, LTD.—Issue on April 14th, 1913, of £250 debentures, part of a series of which particulars have already been filed.

C. TOWNSEND HOOK AND CO., LTD.—A memorandum of satisfaction in full on March 29th, 1913, of third debentures issued pursuant to resolutions of August 5th, 1908, and November 3rd, 1909, securing £25,000, has been filed.

MAGPIE PUBLISHING CO., LTD.—Particulars of £500 debentures, created April 9th, 1913, filed pursuant to Section 93 (3) of the Companies' (Consolidation) Act, 1908, the whole amount being now issued. Property charged—the company's undertaking and property, including uncalled capital. No trustees.

COMPANY NOTICES.

TYNESIDE NEWSPAPER CO., Ltd.

A meeting of creditors of the Tyneside Newspaper Co., Ltd., was held at Newcastle, on Tuesday. It was announced that the debenture-holders had paid every creditor in full. The bulk of the creditors had already received full payment, and any outstanding claims would be similarly met. The Tyneside Newspaper Co. are owners of the *Jarrow Guardian* and *Wallsend Herald*.

NORWICH GRAPHIC CO., Ltd.

Notice is given that at a meeting of the company, held at Norwich, on April 7th, the following resolution was passed:—"That it has been proved to the satisfaction of the company that this company cannot, by reason of its liabilities, continue its business, and that it is desirable that the same should be wound up voluntarily, and that the company be wound up accordingly. That Mr. E. E. J. English, of 9, Thorpe-dene, Norwich, be appointed the liquidator of the company.

BUSY BEE PRINTING AND PUBLISHING CO., Ltd.

A meeting of the creditors of the company will be held at Liverpool, on April 28th.

COMMERCIAL INTELLIGENCE.

Re ROBERT ALFRED SUTTON, Publisher.

This debtor failed in February with total liabilities £1,580 19s. 1d. (unsecured £1,315 1s. 2d.) and net assets valued at £241 11s. 3d., after deducting £36 18s. 9d. for payment of the preferential claims. He attended last week before Mr. Registrar Linklater, at the London Bankruptcy Court, for public examination, and stated in reply to Mr. Egerton S. Grey, official receiver, that having been employed in the trade for many years he, in or about 1884, began business on his own account as a publisher at 11, Ludgate-hill, E.C., with a capital of about £500, his savings. For a time he had a partner, but the trading was a failure and the partnership was dissolved, the partner retiring without receiving any consideration. In June, 1892, witness converted his business into a limited liability company, registered as "R. Sutton and Co., Ltd.," receiving as consideration £3,000 in shares of the company and the position of managing director. The company, however, was a failure; it ceased to do business two years later, and was finally dissolved in 1901. The liabilities of the business outstanding at the date of the formation of the company had been discharged. In 1903 witness purchased for £10, from the debenture holders, the assets of the company, and with a cash capital of £10 or £20, recommenced business as a publisher at 43, The Exchange, Southwark-street, S.E., under the style of "Robert Sutton." In 1906 he was joined by another person, who agreed to pay £1,000 for a one-half share in the business. That partnership was dissolved in 1908. Witness took over a portion of the business with its liabilities and removed to 67, New Oxford-street, W.C.; after the dissolution the business was carried on at a loss. In March, 1912, he removed to 28, Henrietta-street, Covent-garden, having on the previous month executed a deed of partnership with the petitioning creditor, who brought in £200 for a one-fifth share in the business. The partner, however, was not satisfied with the position of affairs, and six months later the partnership was dissolved by an order of the Court, and witness continued the business alone. In January last the first of four bills which he had given to his late partner in respect of the sum due to him on the dissolution of the partnership, fell due; he was unable to meet it, and the holder eventually instituted these bankruptcy proceedings. The debtor admitted that he had been aware of his insolvent condition since 1908, and had continued to trade "in the hope of dropping upon a book which would set him on his feet again." He attributed his failure and insolvency to want of capital, bad trade, and to delay in the production of books by the printers, against whom he had no remedy. A complete set of books of account had been kept, but they had not been balanced for two years. This was his first failure. The examination was concluded.

A WORD OF CAUTION.

In giving the official Gazette information, it must be distinctly understood that we take official records as we find them, and accept no responsibility for inaccuracies, while, as an almost invariable rule, the facts will be found correct. We advise our readers, before forming hasty judgment, to consider that there may be in each case a satisfactory explanation which does not appear on the records.—Ed.]

ENGLAND AND WALES.

DISTRIBUTION OF ASSETS.

JAMES, J. F., late of 5, Amersham-vale, New-cross, London, S.E., newsagent, etc. Claims by May 15th to Avery and Wolverson, 487, New-cross-road, S.E., solicitors for the executors.

THE BANKRUPTCY ACTS, 1883 AND 1890.

RECEIVING ORDERS.

WOOD, C., lately carrying on business at 150, Acre-lane, Brixton, London, S.W., stationer, etc. Date of order, April 19th, made on a creditor's petition.

SEARLE, G., 45, Magdalen-road, Mount Radford, Exeter, stationer, newsagent, etc. Date of order and of adjudication order, April 18th, made on the debtor's own petition. First meeting of creditors, April 30th, 11 a.m., at the Official Receiver's Offices, 9, Bedford-circus, Exeter. Public examination of debtor, May 8th, 11.30 a.m., at the Castle, Exeter.

ADJUDICATION.

WILSON, J. F., trading as J. F. Wilson and Co., at 115, Fore-street, London, E.C., printer, stationer, etc. Date of order, April 15th.

NOTICE OF INTENDED DIVIDEND.

CLARKE, A. F., lately trading at 41, Queen-street, Cambridge, stationer. Claims by May 7th to H. W. Cox, official receiver, 5, Petty Cury, Cambridge.

NOTICES OF DIVIDENDS.

SMITH, C. R., Blue School-street, and Market Hall, Hereford, stationer. First and final dividend of 4s 7d., April 26th, at the Official Receiver's Office, 2, Offa-street, Hereford.

BECKWITH, J. W., trading as Beckwith and Co., at 15, Rutland-street, Leicester, bookbinder. First and final dividend of 3s., April 26th, at the Official Receiver's Office, 1, Berridge-street, Leicester.

ALLEN, J. A., 68-70, Caversham-road, and 4, Silver-street, Reading, newsagent, etc. Supplemental dividend of 2¼d., April 29th, at the Official Receiver's Offices, 14, Bedford-row, London, W.C.

APPLICATION FOR DEBTOR'S DISCHARGE.

ROBINSON, K., 49, High-street, Blyth, Northumberland, but formerly of 157, Waller-road, New-cross, London, S.E. journalist. To be heard May 22nd, 10 a.m., at the County Court, Westgate-road, Newcastle-on-Tyne.

THE COMPANIES ACTS, 1890 AND 1908.

NOTICE OF INTENDED DIVIDEND.

THE ALGERNON PRESS, LTD., 3, 4 and 5, Gunpowder-alley, Shoe-lane, London, E.C. Claim by May 12th to H. E. Burgess, official receiver and liquidator, 33, Carey-street, Lincoln's-inn, W.C.

THE late Mr. W. Etchells, printer, of Carlisle, has left estate of the value of £3,667.

THE *Manchester Guardian* notes that posters advertising the wonders of the various producing and hiring kinematograph companies are being printed in hundreds of thousands. And in this matter of poster printing there is the interesting fact to be noted, that of the posters advertising foreign-made films exhibited here a large percentage are printed in this country.

EPITOME OF NEW PATENTS.

Copyright Compilation for the BRITISH AND COLONIAL PRINTER AND STATIONER. Further information concerning the following Patents may be obtained by Subscribers upon application to the Editor. Subscribers desiring information as to the taking out of Patents are invited to write. Letters to be Endorsed "PATENT DEPARTMENT," Office of the BRITISH AND COLONIAL PRINTER AND STATIONER, 58, Shoe-lane, London. Telegrams:—"STONHILL, London."

The Editor does not necessarily endorse the statements contained in the following abstract of specifications, which are condensed from official documents. He holds himself responsible only for the criticism and explanation which is considered desirable in regard to certain of the Patents.

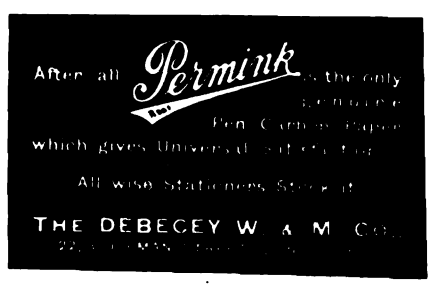
14,340 (1910).—**Improvements in Rotary Folding Mechanisms.**—R. HOE AND CO. (America). Accepted March 9th, 1911.

This invention provides in a rotary folding mechanism, employing a rotary carrier having a plurality of folding blade carrying shafts and blades, means which shall prevent the centrifugal force developed in the revolution of the carrier from affecting the folding blade shafts, thus overcoming the tendency of the shafts to heat and bind in their bearings.

14,485 (1910).—**Improvements in Rotary Lithographic Printing Machines.**—GEORGE MANN AND CO., LTD., and ARTHUR B. EVANS (England). Accepted March 16th, 1911.

By this invention the damping rollers are carried on swinging brackets or some equivalent device, and are subject to the action of a cam motion or the like, so that they come into contact with the plate at the first revolution only of this cylinder immediately after an impression has been taken from the cylinder, and do not again come into contact with the plate until another impression has been taken. The use of such mechanism is claimed to give a more effective roll of the inking rollers, because the surface water has been removed from the plate by the first roll of the inking rollers, and in this way it is possible to use a smaller number of inking rollers than is usually the case, with a consequent saving of time in washing up the machine when changing from one colour to another.

14,838 (1910).—**Improvements in and relating to Rotary Printing Machines.**—SAMUEL J. O. ASMOSSEN (England). Accepted March 16th, 1911.



An improved rotary printing machine which can be utilised either for the double sided printing of a strip or sheet, or for the single sided printing of two strips or sheets, is the subject of this invention. It provides two printing apparatuses, each for printing on one side in one or more colours, and each capable of being connected positively to each other for perfecting, or operated independently of each other for the production of a single side print each.

26,633 (1910).—**Improvements in Variable Speed Driving Mechanism for Printing Presses.**—THE GOSS PRINTING PRESS CO. (America). Accepted June 8th, 1911.

Relates to mechanism of the type in which the high speed mechanism can be introduced while the slow speed mechanism is still operative. Mechanism is provided, according to this invention, having means for independently operating two clutches mounted on the driving and counter shafts respectively, so that the high and low speeds can be introduced or cut out quite independently of each other.

A further invention by the same patentees provides variable speed driving mechanism, in which the movement of a handle in one direction compresses a spring, and then effects an alteration to the speed of the controller, and in which means are provided for automatically locking the controller in the slow speed position and means for releasing same when the lever is operated.

IN the King's Bench Division, last week, Mr. F. E. Smith, on behalf of the *Times*, applied for judgment in the libel action brought against that paper by Bishop Mathew, of Old Catholic Church. Counsel said plaintiff wanted a fortnight's stay to consider his position. Judgment was entered for defendant, subject to stay.

QUADS.

[We do not necessarily identify ourselves with any opinions of our contributor. At the same time, readers will not need to be assured that he always endeavours to communicate something worthy of attention.]

"I hold every man a debtor to his profession, from the which, as men do of course seek to receive countenance and profit, so ought they of duty to endeavour themselves by way of amends to be a help and an ornament thereunto."
FRANCIS BACON, Baron Verulam.

How far have we got in Costing Reform?

o o o

Judging from what I've heard in way of approval and from what I've not heard in disapproval, we are pretty well all agreed on these few things:—

o o o

That better costing is needed not only to secure a bank credit but to prevent a bankruptcy.

o o o

And that with costs rising against the printer the urgency will increase month by month.

o o o

That our profit may grow while turnover possibly shrinks (through our adopting scientific costing while competitors make guesses).

o o o

That ordinarily large profit is more important than large turnover.

o o o

That business large or small cannot "cost" properly save by daily docketing which shall show the use of time and of plant; such docketing as shall tell us what an hour of time or a unit of piece work costs us in any department.

o o o

That correct ascertainment of that hour or piece unit is the central, pivotal point in any sound cost system.

o o o

That that hour or unit cost is worse than useless, unless it really is all that the hour costs, or all that the particular piece unit costs.

o o o

That the hourly or piece unit rates at present relied upon rarely—very rarely—do represent all these costs.

o o o

That the only way to be sure that we have such an all-including hour or piece unit rate is to balance up week by week what we pay and what work we get. That is, to take out the exact number of hours which can be charged up to particular customers. and multiply that number of hours by the rate we have concluded to be our correct hourly rate. Having got that figure, if we find that what we actually have paid, or shall have to pay, as against that figure, is in excess of it, it means that our hour rate is too low. One printer had to add 1d. five times to the hourly rate he thought correct before he could prove it right by this balancing. Years ago I myself had to make the like alteration three times before I was right.

o o o

That the same balancing plan is adaptable for piece points to prevent us paying 1s. 11d. for an hour's composition and selling it for 1s. 8d.

o o o

That the expenses which are not specifically departmental, and therefore cannot be represented by some precise component of the hourly rate are best recovered "in two goes." By way of a percentage upon material handled (10 per cent. at least, but to be settled by each man in his own place), and then as regards the still unrecovered balance by way of percentage upon the combined departmental costs, which include wages.

o o o

That machines should be charged out in much the same way, only that as they differ so much in value, they shall be considered each as so many £50 machines. That is £50 shall be adopted as a convenient common denominator; a convenient machine unit; and the machine charged up with its share of machine-room costs ascertained by seeing how the total number of hours which are run by the total number of £50 machine units divides into total machine-room costs. Leaving minders' and feeders' wages out of account in that inquiry, and adding them on separately. Treating machines as if they were all manned by journeymen, and then deducting one-sixth to represent the apprentice advantage.

That it is dangerous for a printer to apply zeal without knowledge in costing reform; he may proceed to cut off just the job that pays him best (if he did but know it). Just such a case occurred in my own experience.

o o o

That the difficulty of getting income tax commissioners to allow large enough depreciation of plant in the profit and loss account arises from printers not being themselves really informed and generally agreed as to what their depreciation is.

o o o

That the printer should debit his business 5 per cent. interest on his capital, and with a salary for his own services if they are given to it, before he considers he makes a profit. If a sleeping partner suddenly becomes an acting partner he will probably want a salary.

o o o

Not to labour matters too much for one week, those are some things on which I think we are in pretty fair agreement.

o o o

As I write news comes to me of the close of William Hilton's useful and honoured career. It is a pleasant, though a pathetic, retrospect that the last printing event for him was his easily heading the poll in the list of candidates elected to printing pensions.

o o o

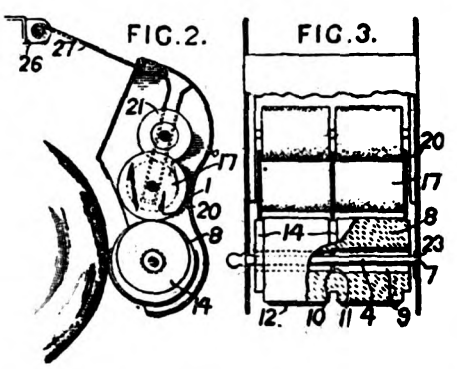
He who had aided so many received back a token, a dear and refreshing token, of the regard in which we held him.

o o o

There was something very wrong somewhere, something very regrettable at any rate, that one who had worked so long and so reputably in the craft and discharged so many offices of trust, should have been constrained at last to avail of the kindly offices of his friends for his support.

o o o

Printing is indeed too often but an ill-requited calling. However, if William Hilton did not acquire material fortune, he built up what I will call moral fortune; a good name; a good fame; and secure possession of "troops of friends."



o o o

One leaves him with a grateful acknowledgment of a long fight, well sustained. There is regret at the sadness and pain of his physical break up; but there is something of real pride that our craft is capable of producing men of his temper of heart and mind.

FRANK COLEBROOK.

Printing and Wrapping Paper.

A device for printing on wrapping paper, patented by Mr. W. W. Hesson, comprises a casing 1, containing the printing roller 8 and inking rollers 17, 21, supported by a bracket 27 hinged to a clip 26 fixed to the paper roller stand. A spindle 4 is passed through a hole in one wall of the casing and is secured at the other wall of the casing by means of a slidably adustable plate 23 slotted to receive

the peripheral groove 7 in the spindle end. The printing roller 8 is provided with a two diameter bore 9 and is supported intermediate of its length on a metal washer 11 inserted in the bore against the shoulder 10, whereby it may swing freely to follow any irregularities of the paper roll. Eccentric portions 14 on the printing roller and concentric discs 20 on the inking roller 17 coact to move the latter away from the printing roller except when the printing surfaces 12 thereon are being inked. The roller may be adapted to print any desired number of colours.

ACCORDING to *Kemp's Mercantile Gazette* there were three failures in the printing and stationery trades of England and Wales for the week ending Friday, April 18th; the corresponding week in 1912 showed four.

Death of Mr. William Hilton.

We deeply regret to announce the death of Mr. William Hilton, which occurred on Friday last, at his residence, 51, Harold-road, Upton-park, E. Mr. Hilton's name has been long and honourably associated with the printing trade charities, and he will be sadly missed by members of the Readers' Pensions Committee, for which body he was an active worker for a great number of years. Deceased, who was 60 years of age, was a London apprentice, serving his time with Messrs. Ann Eccles and Son, and was subsequently successively engaged as compositor, overseer, and reader, with Mr. W. Minter, Messrs. A. Southey and Co., Messrs. J. Causton and Sons, Messrs. Darling and Son, Ltd., Mr. Ernest Nister, Mr. F. Wesselhoeft, Messrs. James Truscott and Son, Ltd., etc. It is, however, in connection with the Printers' Pension Corporation that Mr. Hilton's name is best known. He was a Life and Annual subscriber to this Fund, and a Life subscriber both to the Almshouse Fund and to the Orphan Fund, while for seventeen years he was a member of the Council of the Printers' Pension Corporation. His other activities comprised membership of the City of London Auxiliary, a Founding Member of the Crespin-Harding and Scott-Southcott Pensions, of the Drummond Pension, and of the East Ham and Upton Park Auxiliary, a member of the Jubilee Orphan Auxiliary, and of the Longest Unsuccessful Candidates Committee, and of the Ilford Auxiliary. For thirty years he was a member of the London Association of Correctors of the Press, and for thirteen years was chairman of the Committee of that Association, during which time he actively assisted in establishing the Readers' Pension Committee, by whom five pensions have been founded from subscription lists of £3,000. Moreover he was first hon. secretary and afterwards chairman of this body. In consequence of a severe illness he resigned his seat on the Council of the Printers' Pension Corporation in August last, and his continued illness necessitated his resignation in the following November of the chairmanship of the Readers' Pension Committee, which was formed as the outcome of a paper read by Mr. Hilton, in May, 1886, to the Correctors of the Press, entitled "The Old Corrector: What can we do for him?" The last annual report of the Committee contained a warm eulogium of the services of Mr. William Hilton, who, by his geniality, application, and fertility of ideas, gained the affection and respect of all who came into contact with him. Mr. Hilton was also a member for 33 years of the Royal Standard Benefit Society; a founder and for the first seven years secretary of the Institute of Printers, and a member for 40 years of the London Society of Compositors. Deceased was for many years afflicted with diabetes, developing paralysis, and becoming incapacitated he became a candidate at the Pension Corporation election last March, when he was placed at the head of the poll with 3,978 votes. It is very lamentable that just as he was about to enjoy the fruits of his many years of strenuous labours for others, the hand of death should take him away. The funeral takes place to-day (Thursday) at the Ilford City of London Cemetery.

THERE passed away, last week, in the person of Mr. W. Hastings, a well-known figure in printing circles of Newcastle-on-Tyne. Mr. Hastings was for many years manager for Messrs. Andrew Reid and Sons, Newcastle, and prior to that was in the employ of Mr. Robert Ward, who then published the *North of England Advertiser*.

ANOTHER well-known personality among Newcastle newsmen also passed away last week in the person of Mr. Richard Stephenson, who was for many years in charge of the stereotyping department of the *Newcastle Journal*. Mr. Stephenson, who was a native of the South of England, retired on pension about two years ago.

THE Board of Trade Labour Exchanges, during the four weeks ended March 14th, received 1,750 applications for work in the printing, stationery, paper and allied trades, of which 886 were from women. On the other hand, only 794 vacancies were notified, and 305 of these were for women. The number of situations found in these trades by the Exchanges during the period in question was 606, but only 251 of them were for men. In the Juvenile Branch 772 vacancies were notified, of which 514 were for girls, and 541 filled, of which 391 were taken by girls.

Imitation and Genuine Kraft Papers.

By SINDALL AND BACON.

Article III.

In discussing some chemical tests which might be applied to these papers we may first note the effect of simple solvents.

BEHAVIOUR WITH WATER.—The colour of the genuine kraft remains unchanged, colouring matters being seldom used. In the case of the imitations, which are nearly always dyed to the tone of the natural papers a considerable amount of yellow colour is removed. The water becomes strongly yellow, and the paper changes from the golden brown characteristic of a kraft paper to a greyish tint.

BEHAVIOUR WITH ALCOHOL.—The same result is obtained in the case of extraction with alcohol, the solution becoming yellow, and the paper losing its bright tone.

COLOUR.—It may be noted that the colouring matters used for imparting the desired shade to the imitation papers are usually metanil yellow and its allies. Since the papers are examined for the presence of mechanical wood by means of the well-known phloroglucine reagent, care must be taken to guard against a wrong interpretation of the pink colour developed when the surface reaction is tried. The chemist familiar with the effect produced will not be misled, but a novice might be inclined to accept the presence of ground wood. It is hardly necessary to point out that the acid in the reagent acts upon the colouring matter in the paper to give a pink tone with or without mechanical wood being present.

APPEARANCE OF THE PAPER AFTER EXTRACTION.—In many cases the appearance of the paper after extraction and subsequent drying affords valuable evidence. The surface of the genuine kraft paper usually has a peculiar glossy sheen, and this is much relied on by buyers and sellers as an evidence of genuineness, although the finish of the imitation is so close to it that it is not always easy to discriminate. The smooth surface of the latter is altered by immersion in water, and the glossy appearance is not restored when the paper is dried. On the other hand, the sheen of the genuine paper is not, as a rule, destroyed, and when the paper is dried after the water extraction test it may be observed. Most of the papers examined by us, and reported on in the previous chapters of this series, exhibited these peculiar differences, and the observations were then extended to noting the behaviour of the samples when brought into contact with solutions of bleaching powder.

BEHAVIOUR ON BLEACHING. — Some preliminary experiments were made to see if the papers gave different results with bleach solution, and these were so far encouraging as to suggest the bleach test as a means of confirmation of the nature of the paper. The general effect was to reduce the sulphite papers to a greyish white colour, while the sulphate papers were a distinct canary yellow. If the process was carried too far, however, these differences were less marked and the papers became much alike in appearance. The results were most easily and quickly obtained by soaking small sheets, 3 feet by 2 feet, in hot water, and then immersing them in a large evaporating dish filled with weak bleach liquor. The dish was covered with a watch glass and heated to a temperature of about 70 to 80 F. The samples were occasionally stirred with a glass rod, and turned over, until the differences between the genuine and imitation krafts were at a maximum. The sheets were removed and thoroughly washed with distilled water. After being dried the effect was most noticeable.

APPEARANCE OF THE BLEACHED SHEETS.—The surface sheen of the papers was not so readily distinguished after bleaching, and although a difference between the two krafts could be observed, it was not possible to use this test so readily.

THE USE OF MALACHITE GREEN. — This reagent has long been used as a means of identifying a soda or sulphate pulp. It may be used with advantage in testing the genuine and imitation krafts. It was found that the bleached sheets obtained by the method just described, when boiled in a dilute solution of malachite green gave distinct colour reactions. The genuine kraft papers were stained a much darker colour that the imitation. Further, the latter on being dried and then smoothed with a hot iron between sheets of filter paper, showed the familiar glossy sheen characteristic of the genuine kraft.

MICROSCOPIC EXAMINATION. — A small quantity of each fibre was heated in a solution of malachite green containing two drops of acetic acid. When these were examined under the microscope the genuine kraft paper fibre was moderately well stained, but the pitted vessels of the fibres were seen to be hollow, transparent and colourless. In the case of the imitation krafts the fibres generally were not stained, being very feebly coloured, but the pitted vessels were opaque and stained a deep green.

American News Print.

A very heavy movement of news print paper, with a moderate decrease in stocks on hand, is a feature of the statistics for January of the American Paper and Pulp Association, as filed with the Commissioner of Corporations. Shipments during the month were 110,584 tons, an increase of 4,856 tons over December, 1912. This compares with shipments of 110,122 tons for the month of January, 1912.

Production for January last was 109,664 tons, an increase of 7,546 tons over the previous month, this increase being largely accounted for because of the fact that there were twenty-seven working days in January, as against twenty-five in December. The excess of shipments over production caused a decrease in stocks, which at the end of January were 38,674 tons, or 1,178 tons smaller than the December figure.

The January returns cover fifty-one companies.

Importations of news print paper for January, 1913, amounted to 12,331 tons, of which 87 per cent. came in free of duty.

Exports of British Paper, etc.

In AMERICA

There is published only one weekly paper representative of the interests of employing printers. It is the most popular Printers' Paper read, because:

It is the only strictly Business Paper.
The only Newspaper.
The only Paper which holds the attention of the man who owns the Plant.
The PRINTING TRADE NEWS does not attempt to teach printers to set type, but it is the foremost authority on the latest efficiency methods, the organization activities, progress in cost system work, approved methods of printers' advertising and anything and everything that tends to make the printing business a pleasant and profitable one.

We have good mechanics. Let us have good business men. Let the **NEWS** come to **YOU** every week. Europe **$5.00** per year; Canada **$3.00**. 64 Pages weekly.

The Cleveland Guild of Printers.

The seventh annual exhibition in connection with the Cleveland Guild of Printers, Lithographers, Bookbinders, and Kindred Arts and Crafts, was held this year in the Literary and Philosophical Society's Hall, Middlesborough. The quality of the exhibits was quite up to the standard of previous years, although the entries for the various competitions were rather below the average. The opening ceremony was performed by the Mayor of Middlesborough (Alderman A. Mattison), in the presence of a large gathering, over which the Master of the Guild (Mr. C. W. Richardson) presided.

The Mayor spoke in high terms of the work accomplished by the Guild. One of the most pleasing features of that exhibition was the fact that it encouraged apprentices, while the objects of the Guild were excellent, bringing about as they did a spirit of good feeling between masters and men.

The Mayor of West Hartlepool (Alderman R. Martin) said the work turned out by the craft in Middlesborough was the finest in the district, and he would like to see such Guilds formed in other towns.

The winners of the various competitions were announced as follows:—

Artist Apprentices' Design.—1, A. Marshall, Middlesborough; 2, T. Archer, Middlesborough.
Ruler Apprentices.—1, A. Piggott, Middlesborough.
Compositors' Catalogue Cover.—1, R. B. Rollinshaw; Middlesborough; 2, H. J. Bowmaker, Middlesborough.
Newspaper Advertisement.—1, T. Rooke, Middlesborough; 2, H. McEvoy, Bradford, and C. Ward, Middlesborough.
Three Posters—1, T Rooke.
Mould and Stereo Plate.—1, A. E. Cotterill, Stockton.
Apprentice Compositors.—1, W. Tyreman, Stockton.
Handbill.—1, D. Allison, Middlesborough.
Letterpress Machinemen.—1, J. Claridge, Middlesborough; 2, J. Graham, Middlesborough.
Impressions from Three-Colour Blocks.—1, J. Graham; 2, J. Gray, Stockton.
Letterpress Machine Apprentices.—1, G. McGrother, Middlesborough.
Six Specimens on White Paper, etc. (senior).—1, A. Beardmore, Middlesborough; 2, A. Day, Stockton.
Litho Apprentices.—1, R. Swales, Middlesborough.

Our Foreign Trade.

There was a falling off in the imports and an increase in exports of paper during March. The total values are as under, together with the figures for the first three months, with increases and decreases compared with the corresponding periods of 1912:—

MARCH.

Imports	£577,177 −	£14,368
Exports	310,964 +	24,504
Re-Exports ...	18,262 +	1,821

THREE MONTHS ENDED MARCH.

Imports	£1,806,883 +	£131,990
Exports	956,707 +	59,051
Re-Exports ...	61,526 +	13,082

Last month contained two working days less than March of last year. It will be seen that the imports for the quarter show considerable expansion.

From the tabular statement published on another page it will be seen that the imports of printings or writings on reels show an increase of £15,720, due to larger receipts from Newfoundland and Germany; the arrivals from Norway, Sweden, and the United States were on a reduced scale. The imports of printings or writings not on reels mark an increase of £14,206, contributed to by Germany, Norway, and Sweden. Hangings and other printed or coated papers are the only weak items in the import list, the former showing a reduction of £6,288 and the latter a decrease of £4,198. Competition continues very active in the supply of packings and wrappings to the British market, particularly on the part of Sweden, Germany and Norway, the total imports showing an increase of £66,431. An addition of £30,438 is shown in strawboards, £4,503 in mill and wood pulp boards, and £11,178 in unenumerated, compared with the first three months of last year.

There was a drop of £6,198 on the exports of writings during the three months ended March, as compared with the corresponding period of last year. The shipments to British Possessions were of the value of £74,624, and to Foreign Countries £33,505, decreases of £2,494 and £3,704 respectively. Printings, however, show an improvement of £62,230, the purchases of British Possessions accounting for £45,918, and those of Foreign Countries for £16,312. The total value of the exports of printings to British Possessions was £305,357, and to Foreign Countries £177,471. The shipments of other goods show the following comparative increases in value:—Packings and wrappings, £3,046; paper-hangings, £6,646; paste, mill and cardboard, £1,532; manufactures of paste, mill and cardboard, £1,777; playing cards, £209; envelopes, £2,719; bags, £644; and unenumerated, £2,064. The only decline, in addition to writings, is one of £15,618 in printed or coated papers other than hangings.

Some March Contracts.

The Vickery Patent Sorter.

Description of the Work of an Ingenious Invention.

Papermakers interested in the introduction of modern machinery and appliances will be well repaid by paying a visit to the Vickery's Patents, Ltd., Devonshire-grove, Old Kent-road, London, who are notable for some excellent inventions in the way of paper sorters and layers, suitable for the finishing-room or any other department of an up-to-date paper warehouse.

The First Vickery Sorting Machine.

Over two years ago a sorting machine was worked out by Mr. Vickery, and it appears to be the first device of its kind ever constructed. At one end was the Vickery Patent Sheet Feeder, which is extensively used in the printing trade, and the piles of paper were taken direct from the laying machine into the Automatic Feeder, which automatically separated and fed over conveying rollers a sheet at a time. The sheets were passed down a grade over a piece of highly polished glass, underneath which was a very powerful light, and by this means the overhauler could easily and quickly observe any defects in the paper as it passed. The idea of the light was first used by Mr. Vickery in connection with layers for handling watermarked papers, as it enabled the operator to see the position of the watermark relative to the cut without lifting or touching the sheet as is usually the case. Indeed, the very first machine had an appliance for stopping the sheet during its travel for a fraction of time while it was over the illuminated plate.

Grading Facilities.

The Sorter had also one main receptacle for perfect paper and into it all papers were conveyed, unless of course the overhauler pressed certain levers which enabled the machine to side-track the sheets into other receptacles. But the main receptacle, that is the one for perfect paper, was practically a Vickery Patent Laying Machine of the "S" type that is used for coated papers. It was a machine that automatically jogged the piles on three sides—but two or three extra receptacles could be used for shades, or even for first and second retrees and waste—counted the paper collected on the perfect receptacle when the ream was completed (480, 500, 516, which could be changed in two minutes). It automatically inserted into the pile a card or a slip of paper 2¼-in. which projected ¾-in., thus marking the position of the ream in the pile, but there was no arrangement made for counting and marking the first and second retree, although there was no difficulty except the one of cost. Another point was, the machine had a turning gear for turning over thick papers or cards to look at each side, apart from the inspection afforded by the light. This apparatus automatically switched the sheet on to a second set of conveyors, below the ordinary set, which sent the sheet travelling back towards the unsorted pile, at the end of which it was again switched up on to the top set which presented the opposite side to the view of the overhauler. A device was provided so that if the person judged the sheet on its first travel as being imperfect, a lever was pressed and upon the sheet again appearing with the reverse side up a sound and sight signal was given and the person was able to sidetrack it into the right receptacle. The turned sheet was timed so that it should pass before the person travelling between two sheets showing their first surfaces, the machine automatically working the switches or side-trackers, so that no sheet was allowed to pass into the receptacles before having passed the person with each surface up.

Previous Disadvantages Superseded by Improvements of Economical Value.

Speaking mechanically, the original machine was as near being perfect as it was possible to build a machine. Nevertheless, it had a number of disadvantages and points against it. These may be enumerated as follows:—(1) It was very costly, and, notwithstanding the saving in waste caused by handling it, did not appear as a paying proposition, as it saved no labour. It is true it allowed of less expensive labour but the saving in wages was too small to warrant the outlay. (2) It did not allow of the operator feeling the sheets, so necessary for some classes of paper. (3) The unsorted piles contained a quantity of broke, damaged and parts of sheets, due to "tear outs," ends, etc. The automatic feed was continually stopping or being stopped for these faulty sheets, resulting in considerable loss of time, with the result that the net output was lessened. (4) It occupied a large floor space. (5) It took a competent person to operate it.

No doubt these points convinced Mr. Vickery that it was necessary to produce a Sorter of a less automatic type, and it is in this direction that success has been achieved, as he has produced a Sorter designated the "Semi-Automatic Type," which enables the sorting-hand to sort from 25 per cent. to 75 per cent. more paper without more work than at present. The outstanding features of the up-to-date machine are:—(1) The machine saves an enormous amount of handling, and consequently spoils; (2) The paper is only touched once between making and packing; (3) The machine enables the overhauler to automatically count and mark into reams.

The New Mode of Working.

Now as to the mode of working. The paper is placed on the machine in piles by the Vickery Patent Transporter, either direct from a Vickery Patent Laying Machine, or from piles previously unloaded on the floor. Then automatically-controlled carriages keep the top sheet always level to the top of the "perfect" sorted pile, which is also conducted on an automatically-controlled carriage, and which, when at the bottom, allows Vickery's Patent Transporter to receive the load of sorted, counted and marked off paper, jogged up and ready for packing. The carriages are under the control of one handle and possess an instantaneous automatic action for replacing the carriage, in addition to a quick action for placing in a correct position any piles less than full ones, and an automatic action for always keeping the two piles level at top. Further, the machine can separate the top sheet from the pile, holding it ready for the sorting-hand to take when it passes over the highly-polished table of glass with the strong light underneath, and this being on an angle, and the sheet once put into motion, it automatically continues its travel and is delivered to the pile, automatically jogged, counted, and marked off into reams. Should the overhauler judge any sheet faulty, by the use of a foot or hand lever an arrest while travelling can be made and the sheet consigned on either of a series of receptacles provided. The action of arresting the travel of the sheet also automatically stops a count on the ream counter and records on a second counter. This enables a foreman or any other responsible person to see at a glance the total reams done and the percentage of waste, as the ream counter records the total reams for the day or job, as the case may be. A remarkable feature of the machine is its simplicity and the small amount of space it takes up.

The machine is known as the "Semi-Automatic B Type" when without the automatic separator, and is cheaper than the Semi-Automatic type. It is also supplied without the counting device, if desired, although the saving in broke from handling and the hand counters' wages make the small extra outlay a fine investment. As a matter of fact sorting machines became a practical proposition with the invention of Vickery's Patent Transporter. Let us consider the number of times paper is often handled if layers, transporters and sorters are not used in the mill or factory:—(1) from cutter felt to table: (2) from table to truck in say half-reams; (3) from truck to a stock (awaiting sorting); (4) from stock to truck (when ready for sorting); (5) from truck to sorting benches; (6) overhaulers sheet by sheet and "jogging up"; (7) sorted paper from bench to truck; (8) hand counters; (9) from truck to pile or on to a second truck; (10) and possibly another handling when moving from stock to packers unless packed at once.

Vickery's Patent Layers deliver to transporter, without any touching by hand; transporters instantly unload and pile in any desired place without touching the paper, and by this system the pile can be immediately picked up at any time and put into the Sorter without being touched by hand, while the sorted paper is conducted to an automatically lowering receptacle, and as the Sorter automatically counts, the paper is only handled once from the time it is made until it is packed: that is when the overhauler receives it from the sorting machine.

Comparison of Old and New Methods.

Comparing the old method with this new system of Vickery's Patents, Ltd., one reason why an overhauler is able to sort more paper and count at the same time and mark off into reams without any more work, is that under the new method practically all the operations, except that of inspecting the sheets, is performed mechanically and automatically. In other words, instead of the overhauler having to stop every half-ream or ream to fetch fresh paper to the sorting bench and to lift the sorted paper to a truck or pile, there is a large pile to work from and a large pile can be collected thus saving unnecessary stops. Another point is, the continual stoppage for jogging sheets up is saved, as this operation is performed automatically. The time taken for adjusting from size to size is less than three minutes.

Other machines are in contemplation by Messrs. Vickery; but their present methods are revolutionising the paper trade.

E & S "NICKELOID" QUALITY

WHAT IS "NICKELOID"?

"NICKELOID" specifies the hardest and most durable printing plate yet produced; an electro having a non-corrosive nickel-steel alloy shell, deposited direct upon the mould, which is reinforced by a further deposit of hard tough copper and backed up with a metal of first quality, the whole combining to make up an electro of perfect quality, unsurpassed for durability.

"NICKELOIDS" must not be confused with Nickel-faced electros. They are as wide apart as the poles.

The process is equally applicable to type, line blocks, half-tones, and colour work. In fact, for half-tone and colour work, we combine all the now well-known distinctive qualities of our "Albert-Galvano" (Lead Moulding) Process with the foregoing, and all such work carries our absolute guarantee to give results equal, in every respect, to the originals.

"NICKELOIDS" are suitable for all grades of work, but especially so where long runs and hard work are required. These plates have printed, and will print, runs of exceeding one million from one plate or one set of plates, thus showing a great economy, both in the initial cost (as compared with several sets of ordinary electros), and also in the saving of time changing plates and making ready.

Note our address now, and send us your next job that runs into anything like half a million or more impressions.

Views on Trades Unionism.

Modern Tendencies, Modern Difficulties, and a Way Out.

A Lecture and Discussion at St. Bride Institute.

An excellent paper entitled "Some Views in regard to Trades Unionism" was read by Mr. F. Vincent Brooks, at a meeting of the Institute of Printers and Kindred Trades of the British Empire, at the St. Bride Foundation, Bride-lane, Ludgate-circus, E.C., on Wednesday evening, 23rd ult., and was followed by an interesting and suggestive discussion. The chair was taken by Mr. H. J. Goss (chairman of council), and there was a large and representative attendance.

Mr. BROOKS, in the course of his paper, said it was a cardinal point in his creed that the Heavenly Father still supplied a substantial meal for all his children, notwithstanding their greatly increased number, but the distribution was in the hand of man and such a pretty muddle did he make of it, and so much waste was there that there was seldom enough to go round. For this reason and for half-a-century had he approved and welcomed as much of trades unionism as came under the heading of

Collective Bargaining,

for he felt that it was the best system, with all its faults, that had come under his notice for increasing the number of those who secured a reasonable share of the good things of life. It would be quite easy for him—notwithstanding the very definite views to the contrary that had been expressed by Mr. and Mrs. Sydney Webb, and more recently by Mr. Henry Schloesser, to lay the germ thought of modern trades unionism in very ancient times; to contend for instance that the Hindoo system of caste, about which we are told so much in the Vedas, was simply the way the ancients had of seeing that the members of each caste secured to themselves a "living wage" and the general amenities of their position, and it was interesting to notice that then as now there existed a residuum of unorganised labour known as "Pariahs," and these unfortunate ones generally had a very poor time. None were (and are) so hard on the Pariahs as the class of "Sudras," artisans and labourers, who had only become a caste in more recent times. But it would be sufficient for his purpose if he based his contention on facts within the Christian era, and asked them to start with the dictum of St. Paul that "those who preach the Gospel must live by the Gospel." Then at a later date we found him anxious as to the class of men who should succeed him and his colleagues in their glorious calling, and laying down rules of conduct for those admitted to office in the church. Here we came upon the three-fold idea of Living Wage, Education, and Discipline, as applied to the healers of the soul. Having referred to the great success of this system, and to the following of the example by the other two learned professions—the doctors (healers of the body), and the lawyers (healers of the social fabric), who have continued to be so organised ever since, and having pointed out the adoption of the same course by the trade guilds in the Middle Ages, Mr. Brooks turned to

Modern Trades Unionism.

My contention (he continued) in regard to modern trades unionism is that its leaders have dwelt too much on the living wage question that divides men so seriously, and have given insufficient attention to questions such as education and discipline on which masters and men could co-operate with so much advantage. I am a great believer in the old system of apprenticeship—I think that with the present standard of education it might with advantage be reduced to five years in all trades, so that a boy of 16 may have the joy of coming out of his time when he is 21—but I dissent entirely from the way it is carried out, and my suggestion is that after 2½ years he should, as in the professions, come up for an intermediate examination by a committee of examiners composed of masters and men, and that before he is passed into the trade he should be called upon to pass his final in the same way. This would, I contend, give a great stimulus both to the lad and his employer, for it would be a disgrace to both master and boy if the lad was sent back to his studies and work for a further period. Should such a course be necessary, the young man might perhaps work as an "improver" for one or perhaps two years at a rate intermediate between his present rate and the full pay of a journeyman.

Having cited a recent case of one-sided competency on the part of a young litho machine minder he had employed, Mr. Brooks asked: Is it fair to bring a young man up in this one-eyed way? He perhaps had been a money-maker for his firm during his apprenticeship, but what of teaching had he had to repay him for the low wages he had received during the period? If we were really the civilised country we think we are, such a blighting of a young life would be called a crime! . . . Many of you know better than I do to what extent this sort of thing applies to composing, and how badly equipped is the young man who has spent all his time in "type slinging" and has been given no opportunity at display work. Now what can be done to

Amend this State of Affairs?

I feel in considering this we should take a wide outlook so as to aim at a national system rather than the amendment of things in the special trades in which we are interested. For industrial reasons I do not favour the lifting of the school age above 14, though I consider that the youngsters might be let out on a sort of license, till they are 16, with obligation to keep in touch with their school, and attend continuation classes for a couple of years. My reason for this is that a boy or a girl is in a more receptive mood for the general and technical education of business life than at any other period and if *really encouraged*, it is wonderful what can be got out of them.

Dealing with the general question of apprenticeship, Mr. Brooks said: I would like apprenticeship to be the only way of getting into any trade and becoming a member of any trade union, but it must be under an *improved* and *supervised* system, and I should be glad if the system of premiums could be swept entirely away. Few masters, even with the best intentions, can be free from finding blind-alley occupations. The apprenticeships should be prizes that are offered to these young people. Then as to the form of the Indenture and the method of entering upon it, my idea is that these should all be in strict statutory form, the Board of Trade having power to approve extra forms as they may be demanded to suit various conditions and different trades. I think it would be a great boon if these Indentures were publicly signed in the presence of an official, say the Registrar of the County Court; it would give solemnity to the occasion and bring home to the employer the fact that he had become the industrial foster-father of the young mechanic.

Having pointed to the fact that analogy in law exists for such a step, as in the case of the seaman joining a ship, and admitting the difficulty that exists in the size of our industrial camps, Mr. Brooks spoke about

The Disciplinary Powers

which he felt trade societies might take an increased interest in. Before doing so (he (continued) I should like to make myself clear, for I feel that there is no class of society so free from ordinary crime as the members of the organized trade unions. How seldom do you see a member in trouble. With my long experience I have never had to charge such a man at a police court, and yet how many temptations there are in an ordinary printing office, and how many men have I been in contact with who have come to their work leaving serious and often distressing conditions behind. But such matters as irregularity in attendance, lack of punctuality, that lack of zeal that leaves so many men on the unemployed list, might well be sought out by a sub-committee and attended to. Mr. Brooks then instanced the useful co-operation between men and masters on the part of the Copperplate Printers' Society, tending to turn out the workshy and the inebriates and improve the status of the men as a class, and the diminishment of the habit of getting payments in advance. Turning to money, which he had described in the synopsis of his paper as "the Great Divide," he remarked that he did not use the term because he undervalued the importance of money, or despised the comforts it could confer on the fortunate owner or his successors, and continuing said: But money has its responsibility as well as its advantage, and when it is brought out and used in the domain of industry rather than in excess of luxury there is *primâ facie* evidence that that responsibility is being realised; its possession is an immense privilege, but like every other privilege its full sweetness can only be realised when exercised with due regard to the rights and even the need of others. The "monied" man should remember that the ever-increasing efficiency of machinery reduces labour's share of the result, and leaves a greater residuum of unemployment; it is naturally the aged and otherwise less effective who fall into the vortex, and it behoves all classes and even the State to reduce the number of these ineffectives and then to see that the lot of the unfortunate ones is ameliorated as far as possible. It is by the

Frank Facing of Such Problems

by master and men and not by internecine strife that I feel so much might be done. Many regulations of trade unions are based on too great a concentration of thought on one side of the subject, and when they are found to work in restraint of trade and thus reduce the amount divisible they should be modified by friendly arrangement. Had we a guild in each trade in which we could talk over the things that unite us, as well as a couple of unions to deal with those things that separate us, I am quite sure that great good would arise, both in securing the full efficiency of the workman earlier in life and in making the descent of our seniors into the

Digitized by Google

valley of unemployment less steep than it is at present. In each trade we want our real fighting line as strong and effective as possible and thus keep our mere camp followers within reasonable limits. A favourite thought of mine in regard to our seniors is that they might at the age of 55 voluntarily join a Veterans' Class and submit to a reduction of 10 per cent. in their wages, and at 60 a further step might be taken. Many a man would thus, I think, be kept happily at work and maintain his independence, while his family and society would be relieved of his maintenance.

Perhaps there is no word in the English language that receives a more ready chorus of approbation from the public than the word "Co-operation," but how little has been done by politicians and social leaders towards any substantial encouragement of the idea. For this reason I will throw out a suggestion as

A Basis of Discussion

to-night, and the furtherance might quite possibly form a useful piece of work for this Institute. My suggestion is that any limited liability company desirous of admitting its workpeople into a participation of its profits should give notice of its intention to the Board of Trade and the various trades unions concerned, and substitute the word "Co'op" for "Co." in its title. That no Company distributing less than 10 per cent. of its profit on a wages basis to all its hands shall be entitled to avail themselves of this That the payment of trades unions rates of wages be also a condition. And that if a majority of the employees feel that the businesss is being so conducted, by reason of excessive salaries to partners, directors, or managers, or in other ways, as unreasonably to diminish the profits, or if it is thought that reserves are being formed at the expense of the employees' share, they shall be entitled to have the accounts submitted to the Board of Trade, who shall have power to give directions in a private document addressed to the firm. That on these conditions being complied with the Government should make the concession that for purpose of Income Tax the Co'op be assessed on the Earned Income Scale, by which the Company would be recouped (approximately) to the extent of one-fifth of its distribution to the employees, while in the case of industrial strife, the trade unions might be induced to place such houses "out of bounds" on the understanding that they would fall in line with the eventual settlement when the dispute is over.

Such encouragement coming from two sources would do much to promote co-operation, while I firmly believe that the increased energy and zeal evolved would lead to such a marked success that dividends would be maintained even with larger benefits to the employed class than I have ventured to suggest. I am not unmindful of the splendid efforts that have been made and are being made in this direction, but these efforts want standardising and official recognition if a great humanising forward movement is to be made, and I believe that the time for it has arrived. My suggestion is only one of many that may be made to this end.

Concluding, Mr. Brooks said he hoped no one would detect any socialistic leaven in what he had said, for that was far from his desire; his words had only been a plea for a greater spirit of brotherhood between the various sections of the different crafts.

DISCUSSION.

Mr. E. R. COOK said the paper had raised a lot of points that most of them had hardly thought of on quite the same lines as Mr. Brooks. One of the most important was in regard to the question of apprenticeship. It seemed to him that anyone was brought into the business and apprenticed, and the lad did not trouble and no one seemed to trouble much about him. The prevailing idea was that if an apprentice to the trade picked up something, that was to his credit, but generally speaking he was not taught anything. It would be more beneficial if the apprentice were taught all that could be taught him in business. With regard to the working arrangement between employers and employees, at the present time we were going through

A Transition Stage.

There were what might be called trade union firms, more or less complying firms, and outside firms. When passing through a state of transition there was bound to be a number of set-backs in all shapes and forms, and his idea was that the sooner we get through that transition stage and have the opposing forces of masters and men standing shoulder to shoulder in a solid phalanx as they should do, the sooner there would be a basis of agreement in meeting and overcoming all these difficulties. He believed there was enough commonsense between employers and trade unionists to develope everything that should be of benefit to all engaged in the trade. There should be more homogeneity between the members of a special trade, and the interests of that trade should be of paramount importance both to the trade unions and the employers in the trade. With more cohesion on these lines we should get on better.

Mr. C. J. DRUMMOND said it was more or less a revelation to them to find an employer of labour willing to come down and give them his views on this all-important question. He was an old trade unionist, and one of those who believed in the old methods. He saw no reason to alter the views he had always held, and held stronger to-day than he ever did. The making of the trade unions political he believed had been a mistake. They got on exceedingly well in the old days when they did their very best to deal with social questions between employers and employees, leaving both free to entertain what political views they thought desirous, just as they were left free to deal with their religious views. He knew the world did not stand still, and he could not shut his eyes to the fact that the tendency was in the other direction. With regard to

The Apprenticeship Question,

he thought they could all agree with very much that Mr. Brooks had said. He himself was thrown into a printing office and left to pick up the trade in the best way he could, and no doubt there were others in the room who had been in exactly the same position. Many indentures that had passed through his hands had been, in his humble judgment, bad for want of mutuality; they had been framed almost entirely in the interests of one party. But they must not forget that in the City of London they had a Company—the Stationers' Company—which had its own form of indenture, and, as Mr. Brooks suggested, had always made the indenture firm and binding on the boy in a way that should impress him not only for the time being but probably for all his life. Mr. Brooks—he was sure quite unwittingly—seemed to him totally to ignore something which they felt was doing, in these modern times, a great deal to counteract the evils to which he called attention. In this building they had had for a number of years technical classes to which the boys, who happened to be apprenticed in newspaper, book or jobbing offices, could come and supplement the teaching of the printing offices and learn all branches of their trade. That was a necessary development of modern times. He did not think they could ignore the fact that it was not possible in all cases for the employer to carry out the obligation, as it was termed in the indenture, to teach "the whole art and mystery of printing," because the whole art and mystery was not carried out in his particular office. Much valuable work, however, was being accomplished, here and elsewhere, and something was being done to meet the objections very properly raised by Mr. Brooks in his interesting paper. With regard to the

Relations Between Employers and Workmen,

he could not for the life of him understand why there should be any hostility on the part of the employer towards the trade union properly conducted. Mr. Drummond supported Mr. Brook's remarks on the enormous change for the better in the tone and morale of the journeyman printer in all departments of the trade, and he thought very much indeed was due to the trade unions, but they got very little credit for it. With respect to Mr. Brook's suggestion about the reduction of wages of the men getting on in life, he would like to call attention to the fact that the principle he referred to was in existence in the Society of Compositors. Under certain conditions the men who arrived at 60 years of age were able by arrangement with the firm and chapel to work at a reduced wage upon certain classes of work, rather than that the firm should discharge them; a principle which he himself had introduced.

Mr. MARCHANT spoke of Mr. Brooks as a thoroughly humane employer who took an interest in everybody connected with his business, and remarked that if there were more employers who would exert themselves in this way, instead of thinking merely of the conduct and the profit and loss of their business, they would never have heard of many of the troubles in the trade.

The L.S.C. and Collective Bargaining.

Mr. T. E. NAYLOR regretted that they had not yet heard an expression of opinion from an opponent of trade unions, which might have lent a little colour to the discussion, and said Mr. Brooks' paper was the most interesting and sympathetic estimate of trade unions he had ever heard. Without any disrespect to anyone, he wished all employers viewed trade unions in the same sympathetic spirit. In the course of his experience, short though it might be, he had met many employers who had a genuine desire to work hand in hand with the trade unions, and it was his belief that it was to the interests of all industries for the employers to work as far as possible in co-operation with them. He favoured the view expressed by Mr. Brooks that it would be far better from the point of view both of the man and the master if both sides were so completely organised as to make collective bargaining a real thing. At present it had its most serious limitations. When they met employers in conference it was frequently urged against the request for improved conditions, that the trade unions did not represent the entire industry, with the result that when a collective bargain was made, with the fair trade employers on the one side and the unions on the other, there still remained outside that bargain a body of men on both sides who would not be bound by the agreement which was arrived at, and therein existed

The Great Difficulty

not only for the unions but for the employers as well. That was to say, the fair employer was as much the creator of the circumstances as the men he employed. He had to compete for work in the market with other employers who might possibly not be bound by the same consideration for their employees and certainly not by the legal agreements made by his representatives, and consequently he was always at a disadvantage. He did not know how far the organisations of employers might be held responsible for that, and as to how much responsibility might possibly rest with the unions. Of late years the changes that had taken place in the condition of the industry, the limited liability companies and other modern conditions, had all tended to separate these two sections of the industry, and that

Digitized by Google

had not helped to a better understanding between them. He quite agreed with Mr. Brooks that they ought to get closer together, but it was no good unless they tried to realise each other's position. Mr. Drummond had referred to the change that had taken place in the constitution of trade unions owing to their participation in politics. He was not going to discuss that, but it was just possible that because of that change greater distrust of those unions had been inspired in the hearts of employers, and a position was created by that knowledge which possibly would not exist except for the introduction of politics into trade unions. He was in favour of the unions identifying themselves with politics, but he did not intend to give any reasons for that. He still felt that the employers had to realise

The Change that had taken Place

not only in the processes of the industry, but the changes that had been worked in the minds of the men by the better education that was now given to the rising generation; the men now had received in their younger days that better education which gave them a larger and more liberal understanding of the relationship between labour and capital. As in all cases where knowledge was required in greater proportion, they found greater opposition when injustice was threatened, because the man knew just how to deal with the form of injustice which it was proposed to inflict upon him. Mr. Brooks had described money as the Great Divide, and he believed he was right there. The struggle of the immediate future was for a greater share of the wealth that was produced. The price of commodities had gone up so that a sovereign was worth four or five shillings less in purchasing power than what it was ten years ago, and the workman realised that and was anxious to make good what had been taken from him, not only by the employer deliberately but by circumstances over which they had so little control. The employer found he had to pay more for the materials that went to make up the things he manufactured, and so they found that out of the natural evolution of our economic system those two sections of industry were gradually being taken further and further away from their

Mutual Interests.

He candidly believed in the identity of interests between employers and employees. There was a mutual interest in the prosperity of the printing industry, between the men on the one side and the employers on the other, and if they could get together and so organise those two sections as to come to a proper understanding and agreement between them in order to promote prosperity and trade, which was bound to work for the advantage of each section, it would be so much better. Mr. Naylor spoke of the recent hours movement as an unfortunate parting of the ways, and due to a failure on both sides, and referring to Mr. Brooks' suggestion of a form of co-operation, said he thought it was rather late in the day to talk about co-partnership; economic circumstances were too strong for it. The working man as a class had become distrustful of any scheme that did not allow him to enjoy the advantages and the wealth which he helped to produce. The trade unions, however, believed it was their duty to encourage on all occasions every branch of technical education.

Mr. McAra (chairman of the L.S.C.) having spoken,

Mr. W. H. Burchell, in the course of some remarks, said he thought that every printing business should have a book of the rules that governed the trade unions, so that the printer knew the things they could do and the things they could not do. Many an employer disregarded these rules for want of knowing them. Mr. Naylor had spoken from the workman's point of view, but the employer also had increased burdens to carry, for wages had gone up, and rent, rates and taxes had also risen. He did not think the unions had gone out of their way in regard to their old members. He thought there were many who could be put into a job to-day. He considered there was

Room for a Little More Brotherhood

in the ranks of the trade unions, and he spoke from his own experience. He was of opinion the best man ought always to be allowed to come to the top, and not be prevented by any of his brother trade unionists from showing his extra ability. There were some men in the ranks who did not want to get on, but there were others who did.

The Chairman observed that the apprentice of to-day was very often the manager of to-morrow, and anything that could be done to help his education, technical and otherwise, was greatly to be desired. He was a believer in continuation schools for general educational purposes, and much more a believer in technical schools. He advocated masters giving their apprentices every possible assistance in attending, not always evening classes, but sparing the younger apprentices an hour or two one or two days a week to attend day classes. The turning out of better workmen at a later stage would far outweigh any sacrifice at the beginning. Where the trade unions had gone a little astray was in becoming too political and too socialistic. There was a considerable amount of hostility between labour and capital, and in the printing trade there was such a thing as limitation of output. It was, however, common to the unionist and the non-unionist. He pleaded for mutual interest between master and servant, and the utilisation of the spirit of compromise.

Votes of thanks to the lecturer, on the motion of Mr. A. Langley, seconded by Mr. Naylor, and to the Chairman, brought the meeting to a close.

Getting at the Cost.

Printers and others who are interested in the Costs question may peruse with advantage the following rules for figuring costs and profits that are recommended by the National Association of Credit Men of the United States:—

1. Charge interest on the net amount of your total investment at the beginning of your business year, exclusive of real estate.

2. Charge rental on all real estate or buildings owned by you and used in your business at a rate equal to that which you would receive if renting or leasing it to others.

3. Charge in addition to what you pay for hired help an amount equal to what your services would be worth to others; also treat in like manner the services of any member of your family employed in the business not on the regular pay roll.

4. Charge depreciation on all goods carried over on which you may have to make a less price because of change in style, damage, or any cause.

5. Charge depreciation on buildings, tools, fixtures, or anything else suffering from age or wear and tear.

6. Charge amounts donated or subscriptions paid.

7. Charge all fixed expenses, such as taxes, insurance, water, lights, fuel, etc.

8. Charge all incidental expenses, such as drayage, postage, office supplies, livery or expenses of horses and waggons, telegrams and telephones, advertising, canvassing, etc.

9. Charge losses of every character, including goods stolen or sent out and not charged, allowance made customers, bad debts, etc.

10. Charge collection expense.

11. Charge any other expense not enumerated above.

12. When you have ascertained what the sum of all the foregoing items amounts to, prove it by your books, and you will have your total expense for the year; then divide this figure by the total of your sales, and it will show you the per cent. which it has cost you to do business.

13. Take this per cent. and deduct it from the price of any article you have sold, then subtract from the remainder what it cost you (invoice price and freight), and the result will show your net profit or loss on the article.

14. Go over the selling prices of the various articles you handle and see where you stand as to profits, then get busy in putting your selling figures on a profitable basis and talk it over with your competitor as well.

Catalogue No. 149 (Old French Books) of Herr. L. Rosenthal, 14, Hildegardstrasse, Munich, just issued, includes a section devoted to works on Typography and Lithography, extending to some 150 items, at prices from 2s. upwards. The history of printing in France is particularly well represented, by the works of writers like the late M. Claudin. There are several type specimen books of the eighteenth and early nineteenth century, by Didot and others, and copies of the rare French translation of Senefelder's "Manual of Lithography." Collectors of books on printing should send for a copy of this catalogue, which will be forwarded on application. It also contains a list of some 400 works on Bibliography.

The nine-hours day is about to be put into force in the Belgium typefounding industry, as the result of long negotiations. The minimum rate of pay will at the same time be raised from 5⅓d. to 6½d. per hour.

The U.S.A. New Tariff Bill.

Paper and Pulp Schedules.

In a recent issue of this paper we briefly referred to the new Tariff Bill of the United States, and we now present the schedules relating to pulp and paper in full. It is possible that modifications may subsequently be introduced. At present, however, it seems that the powerful influence of the Press has succeeded in securing print paper, valued at less than 2½ cents a lb., on the free list. There is a proviso governing papers above 2½ cents a pound value, in Schedule M, relating to reprisals for export fee or license, but this refers principally to book and writing papers. Mechanical and chemical wood pulps are also placed on the free list.

The text of the new paper schedule, as introduced for passage by Congress, is as follows:—

SCHEDULE M—PULP, PAPER AND BOOK.

332. Sheathing paper and roofing felts, 5 per cent. *ad valorem*.

333. Filter masse or filter stock, composed wholly or in part of wood pulp, wood flour, cotton, or other vegetable fibre, 20 per cent. *ad valorem*.

334. Printing paper (other than paper commercially known as hand-made or machine hand-made paper, japan paper and imitation japan paper by whatever name known), unsized, sized or glued, suitable for the printing of books and newspapers, but not for covers or bindings, not specially provided for in this section, valued above 2½ cents per pound, 12 per cent. *ad valorem*; provided, however, that if any country, dependency, province, or other sub-division of Government shall impose any export duty, export license fee or other charge of any kind whatsoever (whether in the form of additional charge or license fee or otherwise) upon printing paper, wood pulp or wood for use in the manufacture of wood pulp, there shall be imposed upon printing paper, when imported either directly or indirectly from such country dependency, province or other sub-division of Government, an additional duty equal to the amount of such export duty or other export charge imposed by such country, dependency, province, or other subdivision of Government, upon printing paper, wood pulp, or wood for use in the manufacture of wood pulp.

335. Papers commonly known as copying paper, stereotype paper, bibulous paper, tissue paper, pottery paper, letter copying books, wholly or partly manufactured, crêpe paper and filtering paper, and articles manufactured from any of the foregoing papers or of which such paper is the component material of chief value, 30 per cent. *ad valorem*.

336. Papers, including wrapping paper with coated surface or surfaces, not specially provided for in this section, including wrapping paper, with the surface decorated or covered with a design, fancy effect, pattern or character, whether produced in the pulp or otherwise, but not by lithographic process, whether or not wholly or partly covered with metal or its solutions (except as hereinafter provided), or with gelatine or flock, or embossed or printed, cloth-lined or reinforced paper, parchment papers, and grease-proof and imitation parchment papers which have been supercalendered and rendered transparent, or partially so, by whatever name known; all other grease-proof and imitation parchment papers, not specially provided for in this section, by whatever name known; bags, envelopes, printed matter other than lithographic, and all other articles composed wholly or in chief value of any of the foregoing papers, not specially provided for in this section, and all boxes of paper or wood covered with any of the foregoing paper, 35 per cent. *ad valorem*; albuminised or sensitised paper or paper otherwise surface-coated for photographic purposes, plain basic papers for albuminising, sensitising, baryta coating, or for photographic or solar printing processes, 25 per cent. *ad valorem*.

337. Pictures, calendars, cards, labels, flaps, cigar bands, placards and other articles composed wholly or in chief value of paper lithographically printed in whole or in part from stone, metal, or material other than gelatine (except boxes, views of American scenery or objects, and music, and illustrations when forming part of a periodical or newspaper, or of bound or unbound books, accompanying the same, not specially provided for in this section) shall pay duty at the following rates: Labels, flaps and cigar bands, if printed entirely in bronze printing, 15 per cent. *ad valorem*; if printed otherwise than entirely in bronze printing, but not printed in whole or in part in metal leaf, 25 per cent. *ad valorem*; if printed in whole or in part in metal leaf, 30 per cent. *ad valorem*; booklets, books of paper or other material for children's use, not exceeding in weight twenty-four ounces each, fashion magazines or periodicals, printed in whole or in part by lithographic process, or decorated by hand, booklets, decorated in whole or in part by hand or by spraying, whether or not lithographed, 12 per cent. *ad valorem*; decalcomanias in ceramic colours, whether or not backed with metal leaf, and all other decalmonias, except toy decalcomanias, 30 per cent. *ad valorem*; pictures, calendars, cards, placards, and all other articles than those hereinbefore specially provided for in this paragraph, 20 per cent. *ad valorem*.

338. Writing, letter, note, hand-made paper and paper commercially known as hand-made paper and machine hand-made paper, japan paper and imitation japan paper by whatever name known, and ledger, bond, record, tablet, typewriter, manifold and onion skin and imitation onion skin papers calendered or uncalendered, whether or not any such paper is ruled, bordered, embossed, printed, lined or decorated in any manner, 25 per cent. *ad valorem*.

339. Paper envelopes not specially provided for in this section, folded or flat, bordered, embossed, printed, tinted, decorated or lined, 15 per cent. *ad valorem*.

340. Jacquard designs on ruled paper, or cut on Jacquard cards, and parts of such designs, cardboard and bristol board, press boards or press paper, paper hangings with paper back or composed wholly or in chief value of paper, and wrapping paper not specially provided for in this section, 25 per cent. *ad valorem*.

341. Books of all kinds, bound or unbound, including blank books, slate books and pamphlets, engravings, photographs, etchings, maps, charts, music in books or sheets, and printed matter, all the foregoing, and not specially provided for in this section, 15 per cent. *ad valorem*. Views of any landscape, scene, building, place or locality in the United States, on cardboard or paper, not thinner than eight one-thousandths of an inch, by whatever process printed or produced, including those wholly or in part produced by either lithographic or photogelatine process (except show cards), occupying thirty-five square inches or less of surface per view, bound or unbound, or in any other form, 45 per cent. *ad valorem*; thinner than eight one-thousandths of one inch, $2 per thousand.

342. Photographs, autograph, scrap, post card and postage stamp albums, wholly or partly manufactured, 25 per cent. *ad valorem*.

343. All boxes made wholly or in chief value of paper or papier-mache, if covered with surface-covered paper, 35 per cent. *ad valorem*.

344. Playing cards, 60 per cent. *ad valorem*.

345. All papers and manufactures of paper, or of which paper is the component material of chief value, not specially provided for in this section, 25 per cent. *ad valorem*.

PROVISIONS OF THE FREE LIST.

The following provisions are to be found in the free list:—

574. Paper stock, crude, of every description, including all grasses, fibres, rags, waste, including jute waste, shavings, clippings, old paper, rope ends, waste rope, and waste bagging, and all other waste not specially provided for in this section, including old gunny cloth and old gunny bags, used chiefly for papermaking.

575. Printing paper (other than paper commercially known as hand-made or machine hand-made paper, japan paper, and imitation japan paper by whatever name known), unsized, sized, or glued, suitable for the printing of books and newspapers, but not for covers or bindings, not specially provided for in this section, valued at not above 2½ cents per pound.

593. Rags, not otherwise specially provided for in this section.

653. Mechanically ground wood pulp, chemical wood pulp, unbleaching or bleached: Provided, that if any country, dependency, province, or other sub-division of government, shall impose an export duty or other export charge of any kind whatsoever, either directly or indirectly (whether in the form of additional charge, or licence fee, or otherwise) upon printing paper, mechanically ground wood pulp, chemical wood pulp, or wood for use in the manufacture of wood pulp, the amount of such export duty or other export charge shall be imposed as a duty upon chemical wood when imported directly or indirectly from such country, dependency, province, or other sub-division of government; and if any country, dependency, province, or other sub-division of government shall prohibit the exportation of printing paper, mechanically ground wood pulp, chemical wood pulp, or wood for use in the manufacture of wood pulp, there shall be imposed a duty of one-tenth of 1 cent per pound upon such chemical wood pulp when imported directly or indirectly from such country, dependency, province, or other sub-division of government.

AMERICAN Imports and Exports of Paper, etc.

The imports of paper, etc., into the United States, and exports therefrom, during the periods mentioned, were of the following values:—

Imports.

February—	1912.	1913.
Printing paper ...	$188,693	$526,066
Paperhangings	93,530	135,156
Photographic paper ...	75,047	88,392
Coated paper	40,529	38,304
Wrapping	74,757	61,811
All Other	157,483	165,223
July-February—	**1911-12.**	**1912-13.**
Printing paper ...	$1,611,276	$3,328,230
Paperhangings	553,043	681,264
Photographic paper ...	549,596	865,540
Coated paper	356,998	397,493
Wrapping	555,969	504,044
All Other	1,683,971	1,881,654

The following figures show the imports of printing paper into the United States during February from the countries mentioned:—

	Pounds.	Dols.
France	6,653	455
Germany	39,054	2,974
Italy	45,952	6,608
Netherlands	94,781	4,337
Norway	168,274	4,319
Sweden	84,422	2,697
England	232,405	17,118
Scotland	32,431	1,849
Canada (free) ...	22,418,768	427,287
Canada (dutiable) ...	2,919,303	58,422
Totals	26,042,043	526,066

Exports.

February—	1912.	1913.
Printing Paper	$334,657	$189,815
Writings and envelopes	93,416	109,562
Playing cards	27,782	20,428
Hangings	57,053	69,525
All Other	390,805	262,545
July-February—	**1911-12.**	**1912-13**
Printing Paper	$1,650,492	$1,717,520
Writings and envelopes	746,294	885,515
Playing cards	181,309	206,242
Hangings	234,808	270,720
All Other	3,134,302	2,327,170

IN the King's Bench Division, last week, Mr. Justice Darling and a special jury had before them an action brought by the Challenge Reinforced Tube Co., Ltd., of Eagle Wharf-road, City-road, against Mr. Theodore A. Cook, editor, and Mr. Horace Cox, proprietor, printer and publisher of the *Field*. Damages were claimed for an alleged libel that appeared in that journal on February 27th of last year. In defence it was pleaded that the statements complained of did not exceed the limits of fair comment on a matter of public interest, and that there was no malice. After a hearing the jury returned a verdict in favour of the plaintiff company, assessing the damages at £75. Judgment accordingly with costs.

Tariff Changes

AND

CUSTOMS REGULATIONS.

From the "Board of Trade Journal."

URUGUAY.

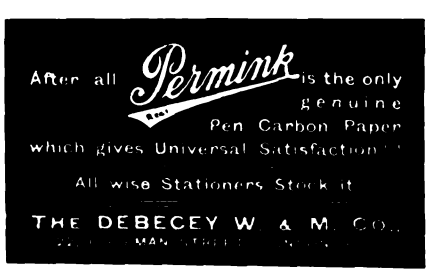
A new basis of valuation for the calculation of certain *ad valorem* duties has been recently promulgated. Linotype metal is valued at about 26s. per cwt. gross, and is dutiable at 5 per cent. accordingly, plus surtaxes amounting to 3·65 per cent. The following are dutiable at 8 per cent., plus the same surtaxes. The kilogramme is nearly 2¼ lbs., and the peso (100 centavos) is taken as worth 4s. 3d.

No.	Article.	Unit.	Tariff Valuation. Pesos. Cts.
172	Typolithographic machines and presses and typewriters ...	—	ad val.*
173	White paper, large format, for newspapers and lithographing, unfolded paper in open sheets of more than 87/64 cent.	Kilo. gross	0 14
174	Black writing ink ...	"	0 20
175	Coloured writing ink ...	"	0 · 80
176	Printing type	"	0 60

* i.e., duty is assessed on the declared value.

DENMARK.

It has been announced that coloured pasteboard, cardboard and paper articles will only be dutiable as "coloured" under Tariff Nos. 213 and 214 when they are coated with colour (have colour laid on) or resemble goods coated with colour. These headings will not, for example, be applied to cardboard produced by pasting together two pieces of paper coloured in the pulp, with a white layer between them, nor, in general, to articles which are clearly made by pasting together layers of uncoloured paper and paper coloured in the pulp. Accordingly, goods consisting of layers of paper adhering together will only be classed under these headings when it is shown by investigation (*i.e.*, by placing a sample in water, so that the layers can be separated, or by burning the corner of a sample so that it splits open) that the article—or the adhering layers of paper—is (or are) coloured on the surface or that it is doubtful whether the colouring of the surface is due to a layer of paper stuck on or to the application of colouring matter. Accordingly, so-called "duplex paper," which does not consist of layers of paper fastened together, and the pulp of which only partly consists of a dyed layer, is to be classified under Tariff Nos. 213 and 214, according to kind.



U.S.A.

The Treasury Department has announced that Dutch metal or aluminium in leaf is dutiable under paragraph 175 of the Tariff, at 6 cents per 100 single leaves, irrespective of whether the importation is in separate leaves as beaten out or in the form of pieces or sheets composed of two or more leaves attached together end to end; and a piece or sheet consisting of two or more leaves so attached or secured is to be counted for purposes of duty according to the number of single leaves that composes it.

The Court of Customs Appeal has decided that post card views covered by paragraph 416 of the Tariff* are such as present actual places, buildings, landscapes, or scenes within the United States.

Picture post cards which imaginatively portray events in the life of Washington are not views of American scenery or objects. They do not profess to represent any real locality or actual scene or scenery within the United States. They are therefore properly dutiable as "cards lithographically printed" at various rates according to thickness, etc.

* "Views of any landscape, scene, building, place or locality in the United States, on cardboard or paper."

A Cost Congress in Manchester.

Following the lead of London, Edinburgh, and other places the master printers of Manchester and district held a conference on the "Costs" question last week, in the Albert Hall in that city. The proceedings were under the auspices of the Manchester and Salford Association of Master Printers, Lithographers and Bookbinders, and the Master Printers' Association of Lancashire and Cheshire. The Congress was held in the afternoon and evening, and many matters of interest were discussed.

Mr. J. C. B. Percy (Percy Brothers), the president of the Manchester and Salford Master Printers' Association, was chairman of the meetings. He explained that the Congress was in no way a price-raising congress. Nor was the movement one for speeding up workmen. He had been surprised to find that some trade unions had taken exception to the system, because they suspected speeding-up. There was no truth whatever in the suspicion, and as a matter of fact three representatives of the printing trade unions had been invited to attend the congress to hear what was said. Mr. Percy said that printing estimates had for long been a by-word and a laughing stock both to the trade and the public, and that congress, together with the others which had been held in other parts of the country, constituted a serious effort to alter that state of things. The congress was not essentially a price-raising one, and, although he did not doubt that if printers found that their costs had been altogether too low they would put them right, that was not the question to be considered at that conference. The great question was as to what their costs were, and the congress was intended to be an educational effort to instruct printers in regard to that. It might be possible that, as an outcome of their deliberations, some of them might find that they had been charging too much, or, on the other hand, too little.

Mr. J. E. T. Allen, of Manchester, also spoke, and traced the history of the cost system, remarking that it had been established in the United States where there had been adopted a uniform method of arriving at cost. The cost committee here, of which he was chairman, recommended the general adoption of a uniform system in this country. It was easily adaptable to either large or small establishments, and would improve the status of the trade, encourage the confidence of their customers, and, incidentally, they all hoped it might improve their balance-sheets.

Mr. W. Howard Hazell said that all they as printers wanted was to establish a system by which they would be able to find out the actual cost of jobs, so that they might charge a reasonable price to their customers; and when workmen understood what it was that was intended employers would find them quite reasonable.

The meetings were also addressed by Mr. Harry Cooke, of Leeds; Mr. J. Severs, Mr. W. Johnson, and other speakers, and the system which the costing committee of the Master Printers' Association has formulated for general adoption was explained in detail to those present and discussed at length, the general opinion of the Conference being favourable to its adoption.

MR. COBDEN-SANDERSON, of the well-known "Doves Press," at Hammersmith, announces the abandonment of his scheme for the publication of a series of Shakespeare volumes, which will not now be carried further than the Three Roman Plays and the Poems. One reason for this alteration of plan will be received with regret—namely, the "not remote closure of the Press." The reason for this is the growing strain of reading, revising, and passing the printed sheets, work which, with the designing of the books, is peculiarly his own. This has grown of late with an increasing pace in the grey twilight of our wintry weather. He is thus "constrained to forgo at last the delight of projects which seemed ever to multiply with the work and the years"; and "to adjust his eyes to other scenes and his hopes to far other projects." There are, however, to be some final publications of the "Doves Press," which "shall serve as far as possible to round off the range of thought and expression comprised in the publications of the Press and the variety of the problems whose solution it has been the primary object of the Press to achieve."

THE 25th anniversary dinner of the Foreign Press Association was held at the Hotel Cecil, last Thursday evening, M. J. Condurier Chassaigne, President of the Association, in the chair. The guest of the evening was the Prime Minister.

Subscribers desiring information as to the taking out of Patents are invited to write. Letters to be endorsed "PATENT DEPARTMENT," Office of the "British and Colonial Printer and Stationer," 58, Shoe-lane, London, E.C. Telegrams: Stonhill, Fleet, London.

Applications.

8,708 MOLINS, W. E., sheet feeds of paper or other material.

8,709 COLMAN, F. S, files for letters, papers and such like documents.

8,755 HESS, L., processes and apparatus for producing printed music sheets.

8,795 GREGORY, W. E., manufacture of invoice sheets and the like for manifolding.

8,825 MAWSON, J. R., lead pencil holders.

8,919 ESPLEN, A., stamp locking and cancelling apparatus.

8,967 BOOLEN, R. VAN, manufacture of counterfoil books, cheque books, or the like.

8,978 LEVY, A. J., memorandum tablets.

8,999 QUIN, H. O., combined envelope and post card.

9,021 SHIPMAN, M. B., calendar.

9,085 MOND, A., dies for use in embossing presses.

9,125 ERIKSON, C. G. A., manufacture of paper and of envelopes and the like made therefrom.

9,161 GOSS PRINTING PRESS CO. (of England), LTD., type chases.

9,185 KLIO-WERK FABRIK FUR GEBRAUCHSGEGENSTAUDE G.m.b H., fountain and like pens.

9,216 HEMSLEY, H. G., cutting machines for paper leather, cloths, fabrics and the like.

Specifications Published, 1912.

Lithographic printing press—Read; 246.

Apparatus for separating and delivering sheets from a pile on to feed-carriers for conveyance to printing and other machines dealing therewith—Cleathero; 8,359.

Method of and a machine for making boxes of paper and like material—Justice; 8,406.

Apparatus for lifting piles of paper to be fed into printing machines, folding machines and the like—Furnival; 8,465.

Letter files—Jackel; 8,834.

Envelopes—Wheeldon; 9,034.

Holder for reservoir and other pens and pencils—Lowthime; 9,336.

Typographical composing machines—Rogers; 24,497.

Machines for cutting books—Votteler; 25,369.

COMPLETE SPECIFICATION OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE 1913.

Cardboard boxes and the like—Bahlsen; 28,495.

QUADS.

[We do not necessarily identify ourselves with any opinions of our contributor. At the same time, readers will not need to be assured that he always endeavours to communicate something worthy of attention.]

"I hold every man a debtor to his profession, from the which, as men do of course seek to receive countenance and profit, so ought they of duty to endeavour themselves by way of amends to be a help and an ornament thereunto."
FRANCIS BACON, Baron Verulam.

I want to mention the vital fact that I've just had lunch.

o o o

Oh, yes, it *has* got something to do with you. Because, you see, as soon as I'd had enough, I stopped. I could have overdone it. I suppose there was some danger of that, though I wasn't conscious of it.

o o o

I went to Cardiff a few days ago. As soon as I'd gone as far as I wanted to, I got out. I could have gone on to Fishguard. I suppose there was a danger of that. I wasn't conscious of it.

o o o

I married one wife twenty years or so ago. I could have gone too far and married two or three. I suppose there was some danger of that; but I wasn't conscious of it.

o o o

Now, that courage which I so much admire in myself wherewith I dared a meal and a train, and risked the danger of being carried too far, should be exercised by every printer employer or employed in the matter of the reform of business, the uniform costing system installation, now being promoted.

o o o

I hope and believe that the journeymen won't seek to place difficulties in the way of its installation, simply because it may be abused; simply because of a danger of its being carried too far. I'm not conscious myself of that as a real danger.

o o o

I do pledge myself to expose and oppose any such abuse by pen or speech or in any way that offers. But I do not see a movement against labour in this campaign.

o o o

Another thought can be attached to this consideration of possibly going too far—the thought of the elasticity or flexibility of the offered system.

o o o

If for instance two or three men are called upon to work on the machining of one particular job that can be noted down as a special expense.

o o o

If you have jobs done for abroad mingling with jobs for the next street, the extra cost of carriage can be, in that case, debited to the particular job; so that you don't distribute too large a sum for travelling among your overhead expenses that have to be recovered.

o o o

If you have very special extra-overtime costs, they can be debited in large part or entirely to the particular job, without vitiating the principle that in a seasonal unequal trade like printing, some allowance for overtime, should be embodied in your hour charge, or you will be pretty sure never to recover it at all.

o o o

If you have an up-to-date book-sewer or some like expensive efficient machine, which however you can't employ as often as you wish, you can, Mr. Hazell suggests, assess a reasonable number of hours work to that machine in determining what is its proper unit hour cost. Otherwise, as I understand him, you load up other binding machines with too much cost, and may do yourself out of jobs on their other machines, or in that binding department, perhaps without getting any more work for the up-to-date machine either.

o o o

If you've a machine that is absolutely standing week after week, month after month, be elastic enough in your costing to leave it out of your hour cost compilation all together. It is capital lost. It may come to life again; perhaps—wait till it does. If it doesn't, sell it; or even scrap it.

o o o

A rotary which lost its newspaper job is a case in point that has been cited in course of recent discussions. Perhaps it should have been turned into an all-size rotary. If from any cause it was accepted as a cumberer of the ground and so retained it should not also be allowed to be a cumberer of the hour cost.

Some years ago I valued a plant within half-a-mile of the Mansion House in London. Need I say, every square yard was valuable. Yet a double-crown (or perhaps larger machine, I'm not quite sure) which had been foolishly bought at a sale and which the men had never been able to coax into doing one single job was left standing month after month; and if the printer in a moment of illumination had decided to instal an hour cost-finding system such as this, he would perhaps have thought he must reckon depreciation on this machine in his hourly rate.

o o o

If you can total all your working hours of a year into all your costs you can do that as your way by ascertaining your hour cost. It looks as if it should be the more accurate way. The principle is in any case not affected. Only I question if many printers can do this. Very few know what is the total number of their chargeable hours in a year.

o o o

If you prefer to divide the year by fifty instead of by fifty-two, this elastic system will serve all right for that; you will deal with only half-a-week's expenses on four occasions in the year, the four occasions when holidays make a broken week.

o o o

If you like to assume that your machines are manned by journeymen, and then deduct one-sixth all round for the economy to you through having apprentices you will probably be doing about the right thing. It is what the committee recommend. But one of the very expounders of the system has told in a frank aside that he doesn't do that; that he charges his large machines as if always run by journeymen. Yet he is working on practically this identical system. It is elastic enough for a modification of that sort.

o o o

Similarly the committee advise the printer to arrive at his own cost of handling and not to worry himself about their suggested minimum of 10 per cent. That will serve for lack of a better; but he should not be too lightly content with it.

o o o

The great feature of this system and why I like it so much is that it is not one more of the too many price lists, attempting to guide equally in unequal cases and conditions. It offers no prices at all; it says, "Find your own costs along these scientific lines, and then put on ½ per cent. or ¾ per cent. for profit if you think that's enough; or 100 per cent. if you think that's not too much and you can get it. Put on what you like." Only know the point at which the putting on of profit begins. Which is what printers generally don't know.

o o o

I daresay I shall find some more elasticity to write about or speak about. But enough for this week.

o o o

I want just to impress that it will be a great mistake to form an adverse judgment on the forms or the principle, because of attaching to it a hard and fast and inflexible quality which does not belong to it.

o o o

Begin with it in a small way if you like, but make a beginning. If it goes too far for you in any particular, stop just there, as I stopped at Cardiff. Very likely you can suggest an improvement in some detail. A printer pointed out at one of the Congresses an omission to supply a column for the ink item in a machine form, and the official spokesman thanked him for, and accepted the correction. It had been an inadvertence. See if you find any other defect.

o o o

Only——

o o o

Don't spend over much time looking for defects. Rather look at the strong and serviceable features. These men have not toiled through eighteen months for nothing. Here is a scientific system, which only means a sensible system, a thorough system. And it is elastic. That is what I this week want to impress.

FRANK COLEBROOK.

"PAPER SUPPLIED."—The position of the Cincinnati printers, in conference with the paper dealers, that when paper is sold direct to a consumer the dealer should pay a commission to the printer, is a rather forward one, but is likely to drive home the fact that the printer is the retailer and must be protected. The Cincinnati printers also claimed that private plants should not be sold at as low rates as to the regular competing printer.

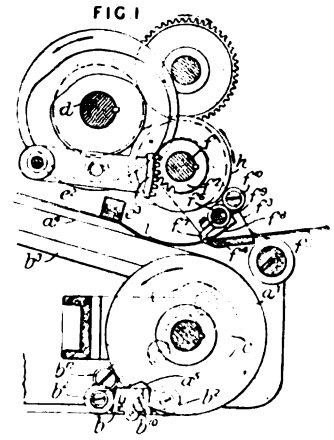
"REORGANISATION AND COSTINGS. A BOOK FOR MANUFACTURERS AND MERCHANTS." By Harvey Preen, F.C.A. London: Simpkin, Marshall and Co.

This is a new and enlarged edition of a book which was first published three or four years ago, and has met with a large sale. The object of the work is to point the way to increased profits by internal reorganisation, the elimination of waste, proper testing systems of raw materials, useful interior factory accounting, and by the introduction of efficient costings. The value of percentage comparisons in regard to purchases, wages, and general costs is fully explained. There is an excellent chapter on banking, auditing, and the value of budgets in business. Diseases of balance sheets and profit and loss accounts are fully explained, and much valuable information is given as to the true and correct manner of costing, both generally and particularly.

Feeding Sheets to Presses.

In an invention by Mr. D. W. Custer, sheets are fed to a printing press by conveyer belts which receive the sheets from a transferring device of the kind which is stationary when the sheets are fed to it, but which is caused to move at the same speed as the belts when transference of the sheets to the belts takes place. The transfer device consists of a suspended carrier with side cheeks in which are pivoted the sheet grippers, and the carrier is operated by a combined cam and toothed gear. As shown, the sheets are fed by hand, or automatically over a feed table f^5 and over an inclined board f^4 carried by arms f^3 on a shaft f. The sheets are registered by stops f^7 carried by a spring-controlled shaft f^6, which is moved by a cam h freely mounted on the shaft f, and a roller f^{10} on an arm f^9 on the shaft f^6. The shaft moves so as to cause a series of fingers f^8 on the shaft to grip the sheet against the board f^4, and then the arms f^3 are moved forward by the action of a rocking sector e^3 and a mutilated gear f^2, the sector being carried by a pivoted arm e^8 which is oscillated by a grooved cam on a shaft d. The arms f^3 are moved at such a

FIG 1



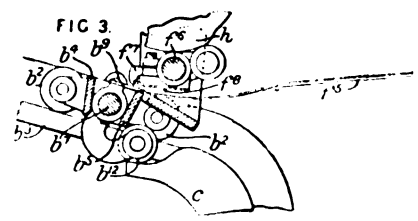


FIG 3.

speed that the sheet is first of all carried forward at a slightly faster speed than the conveyer belts a^4 which are to forward the sheets to a printing press, but at the actual time of transference the fingers f^8 and belts are moving at the same speed. The belts a^4 carry side blocks b with bevelled blocks b^{10} which engage recesses a^5 in the pulleys a^3 over which they pass, and the side blocks are connected by bars b^4, b^5, Fig. 3, the bar b^5, co-operating with gripping fingers b^9 on a shaft b^7 mounted in the blocks b and controlled by a roller b^{12} engaging a fixed cam c, by means of which the grippers are actuated to release the printed sheet and grip a new sheet supplied by the fingers f^8. As shown in Fig. 3, the grippers b^9 have just taken a sheet and the parts f^7, f^8 have been raised for returning to normal position to take another sheet. A guide i directs the sheets to the grippers b^9. The parts b^4, f^5 are dentated to permit of the actuation of the grippers. The belts a^4 are provided with supporting rollers b^2 moving over guide tracks b^1.

Trade Notes.

A NEW French halfpenny daily paper is to be started early in May by M. Clemenceau, the ex-Premier, to be called *L'Homme Libre*.

ARRANGEMENTS have been made to hold an Imperial Press Conference at Montreal in 1914, similar to that held in London a year or two ago.

AT the annual meeting of the Uxbridge Urban District Council, Mr. Walter J. Hutchings, of the Hillingdon Press, Uxbridge, was re-elected chairman.

THE Duke of Marlborough has accepted an invitation to be present at the Printers' Pension Corporation annual dinner on May 28th at the Connaught Rooms.

MR. HARRY LEATHERDALE, of the *Daily Express* literary staff, died last Friday at his residence, 146, Denmark-hill. The funeral took place on Tuesday at Norwood, his colleagues on the *Express* sending a splendid wreath.

AT a meeting on Tuesday of the master printers of the Leigh, Atherton, and Tyldesley district it was resolved to increase the wages of their compositors from 32s. 6d. to 33s. 6d. per week of 51 hours, the overtime arrangements to remain as at present.

IN the House of Commons, on Monday evening, Mr. H. Samuel (Postmaster-General) introduced a bill to enable newspapers published in British possessions to be registered newspapers under the Post Office Act, 1908. On Tuesday the order for the second reading was read and discharged and the Bill withdrawn.

TENDERS ACCEPTED. — For printing and publishing the borough list of voters, etc., for the overseers of the Plymouth Corporation and parish.—Underhill and Co., Frankfort-street, Plymouth. For the supply of printing for the way-ticket system, for the Suffolk joint Vagrancy Committee.—Messrs Smiths (Suitall), Ipswich.

OUR correspondent informs us that the compositors of Norway, who have for several months been negotiating with their employers about a new wage scale, have at last come to an agreement with them, and thus a general strike was happily averted. The unsettled conditions during the negotiations have, however, caused considerable inconvenience to the printing trade for some time.

THE following members of committee were elected at the annual general meeting of the Foreign Press Association held on Friday last :—Mr. J. Coudurier de Chassaigne, president; Dr. Hans Plehn, vice-president; Mr. George Dussol, hon. secretary; Mr. John C. Van der Veer, hon. treasurer; Mr. E. Palmie, assistant hon. secretary; Mr. A. Jullien; Dr. G. Krause; Dr. Paul Muller Heymer; and Mr. T. Sambucetti.

THE GHENT EXHIBITION. — Those of our readers who intend to visit the Ghent International Exhibition, which opened on April 26th, should make a point of seeing the exhibit of Linotype and Machinery Limited in the British Section. The exhibit will comprise an L and M Two-Revolution Press, an L and M Offset Litho Rotary, two Multiple-Magazine Linotypes, and an L and M Automatic Metal Furnace.

THE presentation of a testimonial to Mr. W. H. Slater, responsible instructor of the Borough Printing Classes, to celebrate the completion of his 21st year as teacher of printing at the Borough Polytechnic Institute, will take place in the Lecture Hall of the Institute on Tuesday next, May 6th, at 8.30 p.m. Mr. Arthur Powell, K.C., will occupy the chair. The form of the testimonial is an illuminated address and purse of money. All old students and friends are cordially invited.

PRINTING PLANT, PAPER, ETC., WANTED.—The *Board of Trade Journal* announces that H.M. Chargé d'Affaires at Port-au-Prince reports that a British subject in that town, who is desirous of purchasing supplies of paper, etc., hand power machinery for cutting paper and envelopes of all sizes, machinery for printing paper headings, visiting cards, monograms, letter cards, etc., and other requisites for a small printing and stationery establishment, wishes to hear from United Kingdom manufacturers of these articles. The name and address of the enquirer can be obtained by manufacturers in the United Kingdom on application to the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall-street, London, E.C. Any further communications regarding the enquiry should be addressed to the British Consulate, Port-au-Prince.

THE Blackfriars Type Co., 154, Blackfriars-road, S.E., issues an excellent specimen book of body founts cast on the British-American point standard, and ranging from 6-point to 18-point. The price list shows a considerable saving, especially in large founts. A number of examples of titlings, logotypes, accents, signs, etc., are also shown in the book.

ACCORDING to *Kemp's Mercantile Gazette* there was one failure in the printing and stationery trades of England and Wales for the week ending Friday, April 25th; the corresponding week in 1912 showed four.

IN memory of the late Mr. G. W. McLean, many years managing director of Messrs. R. Robinson and Co., Ltd., a silver cup has been presented to the Clavering Bowling Club, Newcastle-on-Tyne, by his sons, Messrs. J. S., E. E. and G. H. McLean. The cup, to be known as the "George White McLean Cup," is beautifully chased. It is to be competed for annually.

A FIRM at Marburg, Germany, is manufacturing type from linoleum, which is designed to take the place of wood letter. It is said to print very sharp and clean. In order to harden the material, a secret strengthening composition is used, and support is further given by facing the material with a veneer of mahogany a pica in thickness. This new linoleum type is moderate in price and manufactured in sizes from 12 up to 64 picas.

MR. BONAR LAW was the principal guest at the annual banquet of the Parliamentary Press Gallery the other evening, and on rising to reply to the toast of his health, proposed by Mr. Harry Jones, read a letter which he had received from Sir Henry Lucy announcing that after consultation with the Governor of the London Hospital, he had arranged for the endowment of a bed to be called the Press Gallery Bed, where members, or their wives or children, would in times of sickness be cared for, and to seal the bargain Sir Henry Lucy had great pleasure in sending the chairman of the London Hospital a cheque for £1,000.

PAPER BOX-MAKING IN IRELAND. — At a meeting of the Paper Box-making Trade Board for Ireland, a resolution was passed fixing a minimum rate of wages of 6d. per hour for male workers. Special minimum rates were also fixed for male learners, commencing at 4s. 6d. a week (based on a week of 52 hours), when employed under 15 years of age, and rising to the full minimum rate of 6d. an hour. A male learner is defined as a worker under 24 years of age who, while employed, is engaged during the whole or a substantial part of his time in learning some branch or process of the trade. These minimum rates are to come into force on June 6th next.

MESSRS. JORDAN AND SONS, LTD., the well-known firm of company registration agents, printers, and law publishers, of 116 and 117, Chancery-lane, W.C., have recently completed the fiftieth year of their existence. The business was established in 1863 at 123, Chancery-lane (said to be the identical house in which Izaak Walton resided), by the late Mr. Richard Jordan, he being joined shortly after by his brother, Mr. William Jordan, who has ever since been actively associated with the management of the business. The firm was registered as a limited company in 1895, the directors being Mr. William Jordan and his son Mr. Herbert W. Jordan, they having since been joined by Mr. Jesse H. Davenport, who was for many years engaged in the firm's printing department. In all parts of the United Kingdom the firm has a large *clientèle*, and its reputation extends over practically every part of the world, the name "Jordan" being known wherever limited companies are found.

TENDERS WANTED.—For printing 300 copies of the list of poor for the half-year ending March 31st, 1913, for the Cardiff Guardians. Forms of tender, from Mr. Arthur J. Harris, Queen's-chambers, Cardiff. For printing the minutes of the Inverness Burgh School Board, specifications from Mr. W. C. Macbean, 42, Union-street, Inverness. For printing, stationery, account books, etc., for period ending March 31st, 1914, for the Edmonton Education Committee. Particulars from the Education Offices, Brettenham-road, Upper Edmonton. For printing contribution cards for the National Health Insurance Commission. Particulars from the Controller, H.M. Stationery Office, Westminster, S.W. For printing for one and three years, for the Southampton Education Committee. Particulars from Mr. T. Williams, St. Mary's-road, Southampton. For a supply of sealing wax, twine and envelopes to the Postmaster General's Department in Queensland. Forms and specifications from the High Commissioner, 72, Victoria-street, S.W.

THE May number of *Pearson's Magazine* has some splendid reproductions of pictures by Ferdinand Leeke, illustrating episodes in Wagner's "The Ring of the Nieblung." Accompanying the pictures is text telling in attractive fashion the story of each opera. There is also an entertaining interview with Madame Melba. Snow and ice in June sound improbable, but the refreshingly cool illustrations of the article on "Winter Sports at Midsummer" show that ski-ing, skating, and tobogganing may be enjoyed then in Norway. There is a big sports meeting at Finse in June, and the writer's attractive descriptions give one a new idea for a summer holiday. There is much excellent fiction, notably "The Fan," by William Caine, a short story of considerable literary merit.

THE late Mr. Arthur Robinson, a director of Messrs. E. S. and A. Robinson, Ltd., printers and stationers, has left estate valued at £165,491 gross, with net personality £150,847.

THERE has just been erected in All Saints' Cemetery, Jesmond, Newcastle-on-Tyne, a carved Celtic cross in Howley Park (Yorks) freestone, to the memory of the late Mr. J. B. Radcliffe, many years sporting editor of the *Newcastle Daily Journal*. He was "a man of many parts"—rower, cyclist, golfer, billiard player, an actor of no mean repute; in fact he had tempting offers to desert the Press for the stage; and as a delineator of Tyne-side songs and character he was inimitable. As a sporting journalist he was an undoubted authority on nearly every branch of sport. The inscription is as follows :—

In Affection Memory of
JOSHUA BAGNALL RADCLIFFE,
Journalist,
Author, Actor, Sportsman.
Born August 22nd, 1849.
Died January 21st, 1908.
"After life's fitful fever, he sleeps well."

Erected by his friends.

IN the King's Bench Divisional Court before Justices Ridley, Pickford and Avory, the editor, publisher and printer of the *Daily Mail* were fined £100 and costs for contempt of Court in publishing such statements about the death of Mr. Julian B. Hall, the aviator who was shot in a flat at Denman-street, as were likely in the opinion of the Divisional Court to prejudice the fair trial of the person who stands accused of murder. In a similar case against the *Globe*, an affidavit was put in from Mr. Charles Palmer, the editor of the paper, in which he said he did not think the statement complained of was prejudicial to the accused woman. If the Court, however, thought otherwise, he offered his apologies for the publication. Mr. Justice Ridley said the Court had some hesitation in coming to a conclusion that they ought not to interfere in this matter. They thought, however, the proper thing would be to discharge the rule, without any order as to costs.

New Companies.

WEST LONDON OBSERVER, LTD.— Registered on April 18th, with a capital of £5,000, in £1 shares, to take over the business carried on at 4, King-street, Hammersmith, as the *West London Observer*, and to adopt an agreement with Agnes H. Bremner. The subscribers are Mrs. A. H. Bremner and A. G. S. Laurie. Private company. The number of directors is not to be less than two nor more than five; the first are Agnes H. Bremner (permanent), B. B. Croft and T. H. Redfern. Registered office: 16, Queen-street, Hammersmith.

PETTITT, COX AND BOWERS, LTD.—Registered on April 18th, with a capital of £15,000, in £1 shares, to take over the business of printers, etc., carried on by J. H. Cox and J. H. Bell as "Pettitt and Cox," and to adopt agreements (1) with J. H. Cox and J. H. Bell, and (2) with J. H. Cox and G. Bowers. The subscribers are J. H. Cox and G. Bowers. Private company. The number of directors is not to be less than two nor more than six; the first are J. H. Cox and G. Bowers (both permanent, subject to holding 1,000 shares each). Each of the permanent directors shall have the right, so long as he holds 3,000 of the shares originally allotted to him, to appoint two directors. Qualification of ordinary directors, 200 shares. Registered by Foulger, Robinson and Miller, 1, Hare court, Inner Temple, E.C.

H. TURNER AND SON, LTD.—Registered on April 24th, with a capital of £3,500, in £1 shares, to take over the business of a newsagent and stationer carried on by H. Turner, in Sheffield. The subscribers are H. Turner and A. Turner. Private company. The number of directors is not to be less than two nor more than five; the first are H. Turner (permanent managing director and chairman, subject to holding £1,000 shares) and A. Turner. Registered by Shaw and Sons, Fetter-lane, E.C.

ALFRED GOODE, LTD.— Registered on April 23rd, with a capital of £1,000, in £1 shares, to carry on the business of printers, stationers, bookbinders, fancy goods dealers, etc. The subscribers are A. Goode, H. J. Herbert, and

Digitized by Google

S. R. Goode. Private company. The number of directors is not to be less than two nor more than five. The first are A. Goode (managing director), H. J. Herbert and S. S. Goode. Registered by Palmer and Robinson, 18 and 19, Charles-square, Hoxton, N.

ARTISTS' PRINTERS, LTD.—Registered on April 23rd, with a capital of £2,000, in £1 shares, to take over the letterpress printing branch of the business carried on by the Artists Illustrators, Ltd., and the business carried on at 209, High-road, Balham, S.W., as "Pullin Brothers and Co.," and to adopt agreements (a) with Artists Illustrators, Ltd., (b) with C. B. Pullin and F. Pullin (c) with D. Macbeth, and (d) with said C. B. Pullin and F. Pullin. The subscribers are D. Macbeth, F. Pullin and C. B. Pullin. Private company. The number of directors is not to be less than two nor more than five. The first are D. Macbeth (governing director), F. Pullin (managing director), C. B. Pullin (secretary), and one other to be nominated by Artists Illustrators, Ltd. Qualification, £10. Remuneration as fixed by the company. Registered office: 94a, High-road, Balham, S.W.

WESTMINSTER BOOK CO., LTD.—Registered on April 24th, with a capital of £500, in £1 shares, to carry on the business of librarians, booksellers, stationers, newspaper and general publishers, etc. The subscribers are E. V. Allen and H. F. Deane. Private company. The number of directors is not to be less than two nor more than three. The first are H. A. Moore and E. V. Allen. Secretary, E. V. Allen. Registered office: 213 (East Block), Caxton House, Westminster.

POSENER, WALTERS, HARRIS AND CO., LTD.—Registered on April 22nd, with a capital of £1,600, in £1 shares, to carry on the business of colour, process and half-tone engravers, photo etchers, stationers, printers, etc., and to adopt agreements with L. Posener, G. Walters, and H. Harris and with F. T. Rachel. The subscribers are:—L. Posener and F. T. Rachel. Private company. The number of directors is not to be less than three nor more than five; the first are L. Posener, F. T. Rachel, G. Walters and F. Harris, each of whom may retain office while holding 200 ordinary shares. Registered by Marriott and Pyke, 7, St. John's-hill, S.W.

SUTTON AND DAVIDSON, LTD.—Registered on April 22nd, with a capital of £500, in £1 shares (400 preferred), to carry on the business of printers, stationers, paper merchants and manufacturers, publishers, etc., and to adopt an agreement with H. C. Davidson. The subscribers are:—H. C. Davidson and A. J. Sutton. Private company. The number of directors is not to be more than three; the first are A. J. Sutton and H. C. Davidson. Registered by H. C. Davidson, 22, Philpot-lane, E.C.

GRIFFITHS AND MILLINGTON (NORTHERN), LTD.—Registered on April 21st, with a capital of £5,000, in £1 shares, to carry on the business of general advertising agents and contractors, etc. The subscribers are R. T. Simcock and H. A. Leicester. Private company. The number of directors is not to be less than two nor more than seven; the first are R. T. Simcock and H. A. Leicester. Qualification, five shares. Registered office: 22, Wellington-street, W.C.

GRIFFITHS AND MILLINGTON (SOUTHERN), LTD.—Registered on April 21st, with a capital of £5,000, in £1 shares, to carry on the business of general advertising agents and contractors, etc. The subscribers are R. T. Simcock and H. A. Leicester. Private company. The number of directors is not to be less than two nor more than seven; the first are R. T. Simcock and H. A. Leicester. Qualification, five shares. Registered office: 22, Wellington-street, W.C.

W. J. THOMPSON CO.—Registered with a capital of $50,000, in shares of $100, each in the State of New York on February 10th, 1910, to carry on the business of publishers, advertisers, etc. British address: 5, Bouverie-street, E.C., where G. H. Jowett is authorised to accept service.

LAMB AND CHAPMAN, LTD.—Registered on April 17th, with a capital of £1,000, in £1 shares, to carry on the business of general advertising contractors, billposters and distributors, etc., to acquire the business carried on by H. G. Lamb, at 1, King-street, Twickenham, and 17, Paved-court, Richmond, as "Lamb and Chapman." The subscribers are, Miss A. E. S. Lamb, and H. G. Lamb. Private company. The number of directors is not to be less than two nor more than five; the first are, H. G. Lamb (managing director), and T. G. Lamb. Registered office: 1, King-street, Twickenham.

EDMUND BUSH AND SON, LTD.—Registered on April 21st, with a capital of £5,000, in £1 shares, to take over the business of printers' engravers, carried on by E. Bush and H. Bush, at 14, Carr-lane, Camp-road, Leeds, as "Edmund Bush and Son," together with the benefits of certain patents relating to improvements in moving stirrer apparatus for mixing printing inks and the like, etc. The subscribers are E. Bush, H. Bush and H. Whitehead, Private company. The number of directors is not to be less than 2 nor more than five. The first are E. Bush, H. Bush and H. Whitehead (all permanent). H. Whitehead shall have power to appoint his son, J. S. Whitehead, to be a permanent director on his attaining the age of 21. Qualification, £100 shares. White Horse-street, Leeds. Registered by Jordan and Sons, Ltd., 116-117, Chancery-lane, W.C.

Printers' Managers and Overseers ASSOCIATION.

NORTH MIDLANDS CENTRE.

This Centre of the P. M. and O. A. held their usual monthly meeting at the Queen's Hotel, Nottingham, on Saturday last, when nominations were received for office bearers for the ensuing season for election at the annual general meeting to be held in May. Mr. J. Kirkbride, general manager of Barringer, Wallis and Mamura, Bamfield, was nominated for membership.

After the usual business was transacted, Mr. J. A. NESS, A.R.E., a well-known etcher, gave an interesting and instructive lecture, entitled "Original Line Etching (Intaglio)," which was admirably illustrated with plates and a number of fine illustrations—Mr. Ness's own work. These were much admired by an appreciative audience, who took a deep interest in the many processes detailed by the lecturer. The following were a few of the points touched upon:—The plate—copper and zinc, etching grounds, applying the ground, smoking the ground, the drawing, the etching needle, the acid bath, continuous and various bitings, soft ground etching, drypoint, aquatint, mezzotint (black and white and colour), photogravure, half-tone photogravure, printing.

It was an interesting point to those present when Mr. Ness remarked that the printing of the plate very often gave great difficulty to the etcher who prints his own work; in fact it was a fine art to obtain good copies from the best of plates. Many etchers handed their plates over to the professional intaglio printer to print the copies required.

In view of the recent advancement of "Intaglio Printing," and the likely developments in the near future of this ideal and fascinating process, the Centre was fortunate in obtaining the services of so eminent and well-known an artist as Mr. Ness to explain in detail in a happy conversational manner the many points of interest in the various intaglio processes.

The lecturer had many questions to answer relating to the various processes mentioned.

A most interesting lecture was brought to a close by the usual vote of thanks to the lecturer, which was heartily responded to, and he suitably replied.

The lecture was a happy termination to the Winter Educational Union, which has been acknowledged by employers, managers, and workmen in the district to be of great benefit and assistance to the printing craft.

LIVERPOOL AND DISTRICT CENTRE.

The April monthly meeting of the Liverpool Centre was held at the Hanover Hotel, Liverpool, the President, Mr. Harry Firth, presiding over a good muster of members. The Secretary, Mr. Jas. N. Poole, gave a list of the proposed arrangements for the united meeting of the Centres to be held in Liverpool, on June 21st, and read a letter from the Lord Mayor, stating he would be pleased to give an official welcome to the members at the Town Hall on that date. After the conclusion of the general business, the chairman called upon Councillor H. Ross Clyne, of Manchester, to give his lecture on "Judging by Appearances."

The lecturer, who was given a most cordial reception, was in his wittiest vein, and his many humorous anecdotes were greatly enjoyed. He drew the audience on to judge by appearances in art, music, singing, sham philanthropy, fashions, politics, literature and the Press, showing the ideal and the real, and the result of judging by appearances.

A hearty vote of thanks was given to the lecturer, on the motion of Mr. GEO. WATSON, seconded by Mr. J. E. WILSON, and supported by Mr. W. STEWART.

Mr. ROSS CLYNE, in his reply, thanked them for their kindness in inviting him to give another lecture at an early date, and remarked that, as they were aware, this was his second lecture to them during the session, but if they wanted him to come again of course he would have to come. It was a pleasure for him to know that his efforts to please were so much appreciated.

SPECIAL PREPAID ADVERTISEMENTS.

IT IS IMPORTANT that Advertisements under any of the Headings mentioned below should reach us by the first post on Wednesday to insure insertion the following day.

SITUATIONS.—Charges for Advertisements under the headings "Situations Vacant," or "Situations Wanted," are at the rate of

ONE SHILLING FOR 24 WORDS
(3 Insertions: TWO SHILLINGS),

and Fourpence for each additional Eight Words. Minimum Charge, One Shilling.

BUSINESSES FOR SALE or WANTED, MACHINERY WANTED or FOR SALE, SALES BY AUCTION, TENDERS, PUBLIC APPOINTMENTS, MISCELLANEOUS—One Penny per Word.

TENDERS WANTED.

PURSUANT to an Order of the High Court of Justice, Chancery Division, made in the action, "In the Matter of E. P. Bouracier and Company, Limited, Smith v. E. P. Bouracier and Co., Limited, 1912, E. 1,242," TENDERS are invited for the PURCHASE of the BUSINESS of TYPEWRITER EXPERTS, DEALERS in TYPEWRITERS, and all necessary supplies thereto, lately owned and carried on by E. P. BOURACIER and CO., Limited, at 41, Bridlesmith-gate, Nottingham, and 10, South-street, Finsbury-pavement, London, E.C., with Stock-in-Trade, Office Fixtures and Fittings and Trade Utensils, Book Debts, Goodwill, and all the Assets of the said Company to be sold as a going concern as from the 16th day of April, 1913.

Tenders, in a sealed cover marked outside "Re E. P. Bouracier and Company, Limited (Tender)," are to be sent to Charles Hulbert, Esq., at the Chambers of Mr. Justice Warrington and Mr. Justice Sargant, Room No. 315, Royal Courts of Justice, Strand, London, W.C., not later than eleven o'clock on the 20th day of May, 1913.

The tenders will not be made public, but will be opened by the Master at the said Chambers on Tuesday, the 20th day of May, 1913, at twelve o'clock noon, when the persons having tendered may, if they think fit, attend personally, or by their solicitors.

Particulars and conditions of sale and forms of tender may be obtained (gratis) of Henry Hill Bradfield, Esq., the receiver and manager, 21, Victoria-street, Nottingham; Messrs. Taylor, Hoare, and Jelf, 12, Norfolk-street, Strand, London, W.C., Solicitors; and John Alfred Henderson Green, Esq., Burton-buildings, Nottingham, Solicitor.

Dated this 24th day of April, 1913.

CHARLES HULBERT, Master.

Taylor, Hoare, and Jelf, of 12, Norfolk-street, Strand, London, W.C., Agents for J. A. H. Green, Nottingham, Solicitor for the Plaintiffs.

Bookbinders' Pension and Asylum Society.

THE good work which the Bookbinders' Pension and Asylum Society is doing for the infirm and aged poor, must appeal to the sympathy of all those who are charitably disposed. No more laudable object could be supported, and we have not the slightest hesitation in saying that when gentlemen like the Hon. W. F. D. Smith and Hon. Harry Lawson, M.P., lend their names to the list of vice-presidents, it may safely be predicted that the society is in existence to meet the imperative wants of old age and the exigencies that follow in its trail. Sir George Riddell, who presided at the annual meeting, held last week, recalled the old adage that "charity begins at home," and at the same time demonstrated his sympathy with its principles by announcing a subscription of £25—support which will go a long way in keeping a pensioner for a while from the threshold of the workhouse door. He also gave some valuable advice in conjunction with Mr. F. E. Bailey, the Society's genial treasurer, and while agreeing with it in every letter and syllable, we contend that the bookbinders of the City and Metropolis should learn to forfeit a few more pence in the year, than they do at present, for the benefit of the Asylum. They have an Asylum and Society which are a credit to any trade; indeed, there is many another trade and even profession that would forfeit sovereigns in the year to be the possessors of such a valuable adjunct. Therefore, if the bookbinders of to-day in every "shop" do not increase their interest and financial help in their Society and maintain its reputation, undoubtedly they will have something to answer for should they permit such a valuable institution to relax its work or decay for want of money. The Asylum and Society combined stand to-day as a monument to the pioneer work of those in the past, and after all what is more loyal and befitting than to see a trades' man contributing his *mite* to alleviate and help the distress of an old-aged fellow-worker, or his relative, "when he's down." We commend the work of the Society, and hope it may progress with greater success.

* * *

American Imports of Printing Paper.

DURING February the United States imported printing paper to the value of $526,066, an increase of $337,373 compared with the same month in 1912, and the total for eight months ending February is $3,328,230 as against $1,611,276 for the corresponding period in 1911–12 and $1,519,910 in 1910–11. The Canadian exports to the American market for the month showed a considerable increase, the total for printing paper, valued at not above 2½ cents per pound, free of duty, being $427,287 compared with $101,856 for February, 1912, whilst the grand total for eight months reached $2,453,287, an increase of $1,772,576. In "all other" printing paper for books and newspapers, dutiable, the February imports show a reduction of $2,527, the imports being valued at $61,777, as against $64,304 in February, 1912. "All other" printings, dutiable, have advanced in import values from $22,533 in February, 1912, to $37,002 in February, 1913. Other noticeable increases during the month under review are: Paper-hangings, $93,530 in February last year to $135,156; photographic paper, $75,047 to $88,392. Coated papers and wrappings show a remarkable reduction, the former to the extent of $2,225 and the latter $12,946.

* * *

United States Tariff Bill.

ABSOLUTE free trade in print paper below 2½ cents a lb. is a prominent feature of the new Tariff Bill of the United States. Wood pulp is also on the free list. The qualifying clause of the proposed Act, as it applies to importations of wood pulp and news print paper, reads as follows:—"Provided, that if any country, dependency, province or other sub-division of government, shall impose an export duty or other export charge of any kind whatsoever either directly or indirectly (whether in the form of additional charge or license fee, or otherwise) upon printing paper, mechanically ground wood pulp, chemical wood pulp, or wood for use in the manufacture of wood pulp, the amount of such export duty or other export charge shall be imposed as a duty upon chemical wood pulp when imported directly or indirectly from such country, dependency, province, or other sub-division of government; and if any country, dependency, province, or other sub-division of government shall prohibit the exportation of printing paper, mechanically ground wood pulp, chemical wood pulp, or wood for use in the manufacture of wood pulp, there shall be imposed a duty of one-tenth of one cent per pound upon such chemical wood pulp when imported directly or indirectly from such country, dependency, province, or other sub-division of government." Schedule M, which deals with paper, books and allied articles, will be found printed on another page. As previously stated, print paper has been transferred to the free list when worth less than 2½ cents per pound, while the higher grades have been given a tariff of 12 per cent. in place of 15·80 per cent. Copying paper has been cut from 42·32 per cent. to 30 per cent., bag envelopes, etc., from 49·92 per cent. to 35 per cent., parchment papers from 47·92 per cent. to 35 per cent., photographic paper from 28·99 per cent. to 25 per cent., writing paper from 45·13 per cent. to 25 per cent., common wrapping

Digitized by Google

paper from 35 per cent. to 25 per cent., and books from 25 per cent. to 15 per cent. The New York *Paper Trade Journal* says:—"There is no gainsaying the fact that the authors of the present Tariff Bill, if they have their way, will ruin the news print industry of the United States, demoralise the whole paper market, and drive many thousands of people out of employment, and for what? Who is going to benefit by the closing of American mills, and we fear, in many cases, the bankruptcy of their owners? Certainly not the American citizen who buys his daily morning paper for a penny at the news stand. And just as certainly not the newspaper publishers, though it is most difficult to persuade them to see that they are working to their own undoing. They are seeking to close the mills on this side, and with the help of the powers in Congress they may succeed; but in so doing they will remove just as much competitive paper from the market, and so change economic conditions to their own material disadvantage. We have been taught to look upon these moulders of public opinion, these censors of public and political morals, as a broad-minded, high-spirited set of patriots, ready to die in defence of the principle of 'live and let live.' And yet their action in respect to the news print industry stamps them not only as unpatriotic but selfish to an extent which blinds them to every consequence of their own folly. They have been deceived by the glitter of the gold momentarily in sight. . . . While the situation looks gloomy, however, paper manufacturers should not yet lose heart. It is true the Bill has been drafted in accordance with Democratic policy, and is presented to a Democratic House, with the fervent endorsement of a Democratic president, but if the lower house cannot be made amenable to reason, at least there is the Senate left, and according to our advices from Washington the Upper Chamber is far from being unanimous. The Senate, in fact, does not share the unbridled enthusiasm of the House, and it is more than probable that a Conference Committee will be necessary to harmonise the radically divergent views of the leading members of both branches of Congress. A Conference Committee means a compromising committee, and if any industry of all those affected by the proposed Tariff changes is entitled to a compromise in the interests of justice, and for the benefit of American workmen and their families as well as for the conservation of American capital, that industry is the paper manufacturing trade."

"Any Price You Like."—A Brussels journal invites its subscribers to send in particulars of any printing they want done, together with the price they are willing to pay. A reply is promised within 24 hours, to say whether or not the job can be done on the conditions the would-be customer has fixed.

58, SHOE LANE, LONDON, E.C.

WEDNESDAY, April 30th, 1913.

SUPPLIES of credit diminished in the money market towards the end of last week, since when there has been just sufficient to go round. The demand is strong and rates are very firm. The discount market has also firmed up. Bullion movements for the week have resulted to date in a net influx of £423,000, nearly all in bought bar gold. The Fall of Scutari and the delicate situation it has given rise to has caused much nervousness in stock markets. Prices are on the down grade, and markets generally are weak. The monthly settlement in the Consol market commenced yesterday, and the contango rate was 2¾ to 3 per cent. The political news has depressed Consols, which are again a shade lower than a week ago, the quotations being 74⅝ to 74¾ for money, and 74 1/16 to 74 1/8 for the account.

The miscellaneous industrial market has had a quiet week, and the general tone is now dull in sympathy with the depression prevailing on the Stock Exchange. Movements in the section relating to paper and print have been irregular. Amalgamated Press Ord. are down 3/16 to 6 9/16—6 13/16xd., and Ilford Pref. are lower by 1/2 to 3 7/16—3 1/2xd., while International Linotype have risen 1 to 80—85, and Waterlow Bros. and Layton are up ¼ to 7—8. Business has been done during the past seven days in Amalgamated Press Pref. at 21s. 3d.xd.; in *Daily Express* Deb. at acc. 62 and 58; in *Illustrated London News* and *Sketch* Pref. at acc. 14s. 3d., 14s. 3d. and 13s. 6d., and in the Ord. at 3s. 9d.; in International Linotype at acc. 80½ and 84½; in *Lady's Pictorial* and *Sporting and Dramatic* Pref. at 62s. 6d.xd.; in Linotype and Machinery B Deb. at acc. 59½ and 60½, and in the A Deb. at 59⅞; in Edward Lloyd Pref. at 22s. 6d., 21s. 9d., acc. 22s. 3d., 22s., 22s. and 22s. 3d.; in George Newnes Pref. at 15s. 6d., acc. 16s. and 15s. 6d.; in C. Arthur Pearson Pref. at acc. 7½s. 3d.; in Spicer Bros. Pref. at 9; in Raphael Tuck and Sons Ord. at 18s. 6d. and 18s. 6d., and in the Pref. at 5; in Waterlow Bros. and Layton Ord. at 5⅝, and in the Pref. at 7⅛, 7 and 7 1/16; in Waterlow and Sons Pref. Ord. at 12; and in Weldons Ord. at 31s. 10½d. and 31s. 6d., and in the Pref. at 20s. 3d.

DIVIDENDS AND REPORTS.

"STANDARD" NEWSPAPERS, LTD.—The report of the *Standard* Newspapers, Ltd., for the year ended December 31st, 1912, states that during the year, although there has been a considerable improvement in revenue, there has also been increased expenditure incurred with the object of permanently improving the company's business. The trading profit for the year was £12,700, making with £9,400 brought forward, a credit balance of £22,000. After meeting debenture interest and other charges, there remains a net revenue balance of £10,400. After deducting the preference dividends paid on February 15th and August 15th there remains to be carried forward £800.

INTERNATIONAL LINOTYPE, LTD. — The annual general meeting was held on Monday. Sir Joseph Lawrence, chairman, said that the shareholders had received profits for the past year amounting to £47,518, and a total dividend of 8 per cent. Their prosperity depended upon that of the Mergenthaler Co. in America, which had a net surplus of £1,394,944—a pretty solid position—and as long as the American company maintained that position there was every prospect that the International Co. would march side by side with regard to dividends. They held in the American company stock amounting to £550,000, the American value of which was £652,833, or £117 10s. for every £100 in the International Linotype Co. Mr. Quayle referred to the litigation pending between the Linotype Co. and the Miehle Co., and asked whether the revenue of the International Co. would be affected if the Linotype Co. lost. The Chairman said the case was *sub judice*, but whatever the verdict was he did not think it would interfere with the profits of the Mergenthaler Co. or those of their own company. The report was unanimously adopted.

COMPANY MORTGAGES AND CHARGES.

Fresh Obligations registered pursuant to Section 10 of the Companies Act, 1907, and Satisfaction registered pursuant to Section 16 of the Companies Act, 1900. (The registration of Satisfaction is not compulsory.)

SOLOMON BROS., LTD.—Particulars of £4,000 debentures, created April 14th, 1913, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged—the company's undertaking and property, present and future, including uncalled capital. No trustees.

KEITH, PROWSE AND CO., LTD.—A memorandum of satisfaction in full on March 31st, 1913, of second mortgage debentures, dated February 21st, 1902, securing £848, has been filed.

GRIFFITHS AND MILLINGTON, LTD.—Particulars of £7,000 debentures, created April 12th, 1913, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the amount of the present issue being £5,800. Property charged, the company's undertaking and property, present and future, including uncalled capital. No trustees.

JOSEPH B. CLAY, LTD.—Mortgage dated April 14th, 1913, to further secure amounts secured by charges dated March 29th and October 9th, 1912, and March 5th, 1913, securing £300, £50 and £50 respectively. Property charged—55, Gray-street, Waterloo-road, S.E. Holder—J. Hiller, 744, Fulham-road, S.W.

MACRAU, LTD.—Debenture dated April 9th, 1913, to secure £200, charged on the company's undertaking and property, present and future, including uncalled capital. Holder—T. W. Cole, 15, Mattock-lane, Ealing, W.

COMPANY NOTICES.

HALLIGAN LITHOGRAPHIC PRINTING MACHINE SYNDICATE, Ltd.

Notice is given, that a meeting of the company will be held at 35, Bucklersbury, E.C., on June 4th, for the purpose of having an account laid before them, showing the manner in which the winding up has been conducted and the property of the company disposed of, and of hearing any explanation that may be given by the liquidator.

JEWISH WORLD (1906), Ltd.

At a meeting of the company, held at London, on March 17th, the following resolution was passed; and at a subsequent meeting, on April 10th, was duly confirmed:—"That the company be wound up voluntarily; and that Mr. B. H. Segal, of 10, Duke-street, Aldgate, E., be appointed liquidator for the purpose of such winding-up."

BUSY BEE PRINTING AND PUBLISHING CO., Ltd.

At a meeting of the company, held at Liverpool, on April 14th, the following resolution was passed:—"That the company cannot, by reason of its liabilities, continue its business, and that it is advisable to wind up the same, and accordingly the company be wound up voluntarily; and that Edmund M. Owen, of 8, Victoria-street, Liverpool, be appointed liquidator for the purposes of such winding-up."

CLACTON NEWS, Ltd.

In the Chancery Division, on Tuesday, before Mr. Justice Eve, in the matter of the *Clacton News*, Ltd., Mitchell against the company, an application was made on behalf of the debenture holders for the appointment of a receiver and manager. His Lordship granted the application.

SWIFT PRESS, Ltd.

Notice is given, that by an order made by the High Court of Justice upon the application of the official receiver and liquidator of the company, dated April 7th, it was ordered that the following persons be appointed a committee of inspection to act with the official receiver as liquidator of the company, namely:—Harry Wingfield, 67, Watling-street, E.C., liquidator of Stephen Swift and Co., Ltd.; Stewart John Powell, 55, Fetterland, E.C., holding a general power of attorney from W. H. Smith and Son; and William Robertson Gaff, 54, New Broad-street, E.C., holding a general power of attorney from Richard Johnson Walker.

COMMERCIAL INTELLIGENCE.

Re DAVIS and ALLEN, Printers and Stationers.

The official receiver for the Guildford district has now issued his report and observations under the failure *re* Ernest Arthur Bonner Allen, of Fairlight, Maybury-road, Woking, and Martin James Allen, of "Twynham," Manor-road, Horsell, Woking, carrying on business in co-partnership as printers and stationers, under the style of Davis and Allen, at 91, Chertsey-road, and Duke-street, Woking, from which it appears that the debtors have filed a statement of affairs showing, as regards the joint estate, gross liabilities amounting to £1,421 13s. 6d., of which £1,390 14s. 2d. is due to unsecured creditors. The assets are estimated to produce £1,244 8s. 11d., from which £30 19s. 4d. has to be deducted for the claims of preferential creditors payable in full, leaving the net assets at £1,213 9s. 7d., and showing a deficiency of £177 4s. 7d. The debtors allege their failure to have been caused through bad trade, shortness of capital, and loss through taking the Duke-street premises. The report and observations of the official receiver are to the following effect:—The debtors, Martin James Allen, aged 48, and Ernest Arthur Bonner Allen, aged 54, trading as "Davis and Allen," filed their petition on March 10th, 1913, and a receiving order was made thereon. They state that their business was started about 10 years ago by W. J. Drowley and another, as printers and stationers, at 91, Chertsey-road, Woking, and that in September, 1905, Drowley went out and the two debtors entered the business, and all assets and liabilities were taken over by the new firm, the liabilities at that date being under £50, and the assets about £300. The debtor, E. B. A. Allen, who carried on business in partnership with W. J. Drowley as Drowley and Co., builders, took no practical part in the printers' business and merely financed it, while M. J. Allen did not put any money in it, but all three partners were to share in the profits equally. In 1908 or 1909 the third partner retired being paid a sum of £80 on retirement, leaving the business to be carried

Digitized by Google

on by the two debtors. The debtor W. J. Allen, who personally superintended the business, had only had two years' experience in a printing office immediately after he left school. In addition to the office, shop and works at 91, Chertsey-road, the firm has had works at Duke-street, Woking, for over a year, and Stores at Portugal-road, Woking, which have been occupied for about five years. Twelve months ago the partners thought that by taking further premises they would be able to do more business, as in Chertsey-road they could not work overtime owing to the annoyance caused to the neighbours, and this was the reason that they took the Duke-street premises, but in consequence of shortage of capital they found that they were getting further behind and they filed their petition at the same time as the firm of Drowley and Co., in which E. B. A. Allen was a partner. The debtors state that they have kept a cash book, wages book, order book, stock book, and debtor's ledger. From the statements of the debtors, the official receiver is of opinion that they do not sufficiently disclose their business transactions, the results of their trading or financial position at any time. The unsecured indebtedness is returned at £1,390 14s. 2d., due to 117 creditors, and with the exception of £300 for money lent, is mainly in respect of goods supplied. At the request of creditors the official receiver appointed Mr. W. H. Bayne, 1, Oxford-court, Cannon-street, E.C., as special manager of the businesses of Drowley and Co., and Tom W. Smith and Co., and as E. B. A. Allan was a partner in both businesses, it was considered desirable for the protection of the estate that he should also manage Davis and Allen's business. With regard to the separate estate of E. B. A. Allen, this debtor returns four creditors to whom he owes £313 10s. 6d., of which £263 17s. is for money lent. The debtor states that he is a bachelor and lives in lodgings, and has no household furniture, and he has kept no books of account in relation to his separate estate. He states that in conjunction with a friend he has been interested in a photographer's business at Woking, but no definite arrangements were entered into with the friend as regards the profits of the business, and he has received none. In conjunction with the friend he purchased a 21 years' lease of Onslow Hall, Woking, and the new lease was mortgaged for £150, of which £87 10s. is now owing, and the Hall is let for meetings, etc., the money received from letting going towards paying off the mortgage, while any ultimate profits were to be shared between the debtor and his friend equally.

Re ARCHIBALD LEONARD BAYLEY,
Wholesale Newsagent.

A meeting of the creditors of this debtor was held before the Bristol Official Receiver, Mr. C. H. King. Debtor was lately trading as A. L. Bayley and Co., wholesale newsagents. The receiving order was made on debtor's petition. The gross liabilities were returned at £972, all of which was expected to rank. Estimated assets £343, deficiency £628. Causes of failure alleged by debtor: "Having to take over my partner's share of the business on the dissolution of the partnership in June, 1911; want of capital; losses by death of horses used in the business, and bad debts." The official receiver, in his observations, says:—The debtor states that he commenced business as a wholesale newsagent, bookseller and stationer, with a capital of £100, in January, 1908, at Station-street, Walsall, under the name of "Bayley and Co." He put £54 into the business, £14 of which was advanced by his future partner. On August 1st, 1908, he took Mr. Leonard Page into partnership, and the business was subsequently carried on under the name of "Bayley and Page." The capital of each partner was £28. The debtor was entitled to draw £2 10s. per week, and his partner £2 per week, and the profits were divisible equally. In January, 1910, they sold the business for about £1,250, and in March following purchased the goodwill, stock, two horses and carts, and book debts of a wholesale newsagency business carried on at 9, Welsh Back, Bristol, and a few days afterwards removed to 8, Bath-street, Bristol. The debtor states that after paying for this business and discharging their liabilities at Walsall, each partner had a surplus of about £90. The partnership was dissolved on June 21st, 1911. The debtor took over the assets and liabilities and agreed to pay his partner £500 for his share in the partnership by paying £85 down and the balance by instalments of £2 per week without interest. The debtor has paid £259, but contends that he only owes his late partner a balance of £91, as the liabilities at the dissolution were £300 more than the amount of the estimate. The debtor traded on his own account in the name of "A. L. Bayley and Co." between June 21st, 1911, and March 13th last. Mr. F. G. Tricks was appointed trustee with the assistance of a small committee of inspection.

Re E. B. SMITH,
Printer.

This debtor, formerley of Mayfield, Brighton-road, Croydon, made an application for his discharge at the Croydon Bankruptcy Court on Tuesday, April 22nd. Dr. Newnham appeared for the debtor. His Honour said that he had already read the official receiver's report, and Dr. Newnham added that he did not dispute anything substantial in the report. Mr. Hellyer said he wished to remind his Honour of two transactions of the debtor. Between December, 1911, and February, 1912, the debtor purchased from Messrs. Ebbutt's certain goods, including a roll of carpet. When the debtor executed a bill of sale on the furniture at his private house in March, this carpet was still unpacked. The second transaction was with Messrs. Roberts and Co., of North End. In March, 1912, debtor purchased a high-class gramophone and records, valued at £50. The goods were sent to the offices of the Croydon Pictorial Newspapers, Ltd., and when the creditors applied to that company for the £50 they were referred to the liquidator. Mr. Hellyar said he wished to draw attention to these cases because these creditors felt that they had been badly treated in the matter. Dr. Newnham submitted that, taking into consideration all the circumstances, he did not think it fair to suggest against the debtor that when these purchases were made he thought that either himself, or the company of which he was managing director, would be insolvent within a month or so. He agreed that the report showed a very unsatisfactory state of affairs. Debtor said that his present income was £3 a week. He was managing a small printing business. The official receiver stated that debtor had approached him with a suggestion that a judgment for £200 should be entered against him as a condition of his discharge. Personally, he (the official receiver) did not see what prospect debtor had of satisfying such a judgment; moreover, it did not seem enough, considering that debtor had been dealing in thousands. His Honour said that he would adjourn the case until the next Court, in order to give an opportunity of coming to terms with the official receiver as to the entering of a judgment against him of a reasonable sum as a condition of discharge. If such a judgment was not entered the discharge would have to be suspended for a longer period than two years.

Re DUNCAN CAMPBELL LEE,
Newspaper Ventures.

The first meeting of creditors was held on April 23rd, before Mr. W. P. Bowyer, official receiver, at the London Bankruptcy Court, under a receiving order made against this debtor, described as late of 2 and 9, Portsmouth-street, Lincoln's-inn-fields, W.C. A statement of affairs was presented showing unsecured liabilities £2,345 8s. 1d., and no assets whatever. The chairman reported that the debtor, who resided at 14, Talbot-road, Highgate, had stated that he was a journalist, at present without occupation. For two years prior to last December he acted as editor of the *Weekly Times* and managing director of Progressive Newspapers, Ltd. He came to this country from America in 1907, with the view of travelling, writing, and endeavouring to sell works as a free lance. In 1910 he became the managing director of Progressive Newspapers. Ltd., of which concern he was one of the organisers and an original director. He bought the *Weekly Times*, and sold it to the company (Progressive Newspapers, Ltd.) for £800 in shares. His holding in the company was subsequently increased to £1,000. The company went into liquidation in January, 1912, the debtor being appointed a joint liquidator with Mr. H. S. Schulters Young. Dividends had been paid to creditors of the company; the debtor had received his dividend on a claim of £163, and a sum of £10 as remuneration for his services in the liquidation. In July, 1912, he purchased *Vanity Fair* from the receivers at the price of £1,000, made up of £875 cash and £125 allowance for unsold papers. The purchase money was borrowed, and had been repaid. No part of the debtor's present liabilities related to his personal or household expenses. In reply to a creditor the debtor stated that in February last Dr. Allinson took over *Vanity Fair* in settlement of a debt, and it was the fact that he (debtor) had assigned various book debts owing to the paper in order to raise money with which to keep it alive. He attributed his failure to losses sustained in running *Vanity Fair* and the *Weekly Times*. Replying to another creditor, the debtor said he had no interest in any paper or business in America. He was not prepared to submit any proposal for the consideration of the creditors. The case went into bankruptcy and was left in the hands of the official receiver, the debtor's public examination being fixed for May 30th.

Appended is a list of a few of the creditors:—

UNSECURED.

A WORD OF CAUTION.

In giving the official Gazette information, it must be distinctly understood that we take official records as we find them, and accept no responsibility for inaccuracies, while, as an almost invariable rule, the facts will be found correct. We advise our readers, before forming hasty judgment, to consider that there may be in each case a satisfactory explanation which does not appear on the records.—Ed.]

ENGLAND AND WALES.

PARTNERSHIPS DISSOLVED.

TUCKER, W. E., and WALKER, T. H., trading as W. E. Tucker and Co. at 57A, and formerly 6, Holborn-viaduct, London, E.C., printers. Debts by T. H. Walker, who will continue the business under the same style. April 17th.

COX, J. H., and BELL, J. H., trading as Pettitt and Cox, at 22 and 23, Frith-street, and 30, Old Compton-street, Soho, London, W.C., printers and stationers. Debts by J. H Cox. April 24th.

HUNTER BROS., 8, Fetter-lane, Aytoun-street, Manchester, pattern card makers and printers. Debts by Jas. Hunter, who will continue the business at the same address under the style of Jas. Hunter and Co. Jos. Hunter will in future carry on business at 32, York-street, Manchester, under the style of Jos. Hunter and Sons. April 18th.

DISTRIBUTION OF ASSETS.

GOODWIN, S., late of 76, Mill-lane, Sutton, Macclesfield, newsagent. Claims by May 22nd, to W. Pimblott, Chester-road, Macclesfield, solicitors for the executors.

HUMBLE, J., late of 6, Welsh-terrace, Annfield Plain, Co. Durham, stationer. Claims by May 8th, to Ridley and Reay-Smith, Stanley, Co. Durham, solicitors for the executors.

THE BANKRUPTCY ACTS, 1883 AND 1890.

FIRST MEETING AND PUBLIC EXAMINATION.

WOOD, C., 259, Bath-road, Hounslow, London, W. and lately trading at 150, Acre-lane, Brixton, S.W. stationer, etc. First meeting, May 8th, 3 p.m., at the official receiver's office, 14, Bedford-row, W.C. Examination, May 20th, 11 a.m., at the Court House Half Acre, Brentford. Date of adjudication order April 23rd.

ADJUDICATION.

NOAD, C. A., 59, Carey-street, Lincoln's-inn, London, W.C., law stationer. Date of order, April 25th.

NOTICE OF INTENDED DIVIDEND.

RASMUSSEN, J., 3, Southwark-bridge-buildings, Southwark-bridge, London, S.E., printer. Claims by May 10th, to A. Willmott, 14, Old Jewry-chambers, E.C.

NOTICES OF DIVIDENDS.

BLIGH, W. H., Caxton House Works, Broad-street, Ramsgate, printer. Second and final dividend of 5s., May 9th, at the official receiver's office, 68A, Castle-street, Canterbury.

POPP, J. L., Desborough-road, and Frogmore, High Wycombe, Bucks, newspaper agent, etc. Final dividend of 4s., October 17th, High Wycombe, Bucks.

ORDER MADE ON APPLICATION FOR DEBTOR'S DISCHARGE.

COLLINS, W., 2, Beulah-road, Walthamstow, Essex' stationer and newsagent. Date of order, April 2nd. Discharge suspended for two years. The grounds named in the order for refusing an absolute order of discharge were that the bankrupt's assets are not of a value equal to 10s. in the pound on the amount of his unsecured liabilities; that he had omitted to keep such books of account as are usual and proper in the business carried on by him and as sufficiently disclose his business transactions and financial position within the three years immediately preceding his bankruptcy; and had continued to trade after knowing himself to be insolvent.

APPOINTMENT OF TRUSTEE.

BAYLEY, A. L., lately trading as A. L. Bayley and Co., at 8, Bath-street, Bristol, wholesale newsagent. Trustee, F. G. Tricks, 18, Nicholas-street, Bristol. Appointed April 25th.

A Printing Press Action.

Linotype and Machinery, Ltd., *v.* Miehle Printing Press and Manufacturing Co., Ltd., and Others.

Following the report in our last issue, when the Court sat on Thursday last Mr. W. H. Lock, director of the plaintiff company, finished his evidence, and Charles Highman, managing director of Messrs. John Highman and Co., Ltd., printers of the *North Cheshire Herald*, gave evidence as to a contemplated purchase of a Miehle press in 1911. At that time he understood the makers of that press were the Printing Machinery Co., the predecessors of the plaintiffs. Mr. Granville H. Baillie, consulting engineer, Westminster, gave evidence as to the various types of reciprocating bed presses, and the hearing was again adjourned.

On Friday Mr. Baillie gave further evidence and said there was little difference between the Miehle press of 1899 and the present press, in view of the lapse of time. All the essential features were the same in both.

Mr. Walter read a description by the Miehle Co. of the Miehle printing press in 1895. It was, according to this account, invented and manufactured in Chicago, and the company offered it as an article superior to other two-revolution presses. Its product was 20 to 50 per cent. greater than any flat-bed similar press, which could be produced at any price. Robert Miehle, of Chicago, a pressman, had evolved the first accurate bed device which ran in practical unison with the cylinder revolving at a uniform speed. Counsel asked if there was any difference in the method of operation in the new Miehle from the old in the features described in the passages he had read? Witness said the whole of that description would apply to the new Miehle, except one or two words, in which an up and down motion of the driving pinion was referred to.

Mr. James Swinburne, consulting engineer, was called and asked by Mr. Bousfield whether it did not strike him as strange that it was not until manufacturers had had some three years' experience of the working of the new Miehle—testing it experimentally—that they ventured to put it on the market? Witness replied that it was strange, in the sense that it was a counsel of perfection in the engineering world. Are there not differences between these two presses which, apart from the test of experience, might have been found radically to alter the results obtained?—Not radically to alter them. Witness said also that the new Miehle had practically the same arrangement as the old, but was different in details. The details may be all-important?—Yes.

Mr. Astbury asked whether, if the new and the old machines stood side by side one could notice any difference between them?—Mr. Swinburne: You would have to look under the driving gear to see any difference.

Mr. Walter addressed the Court for the plaintiffs. In reply to his Lordship, he said the plaintiffs admitted that they were not to invade the territories of the Miehle Company, and they were quite prepared to undertake that position and not to do it. Counsel contended that the agreement bound the defendants—the American company—not to sell their Miehle press or similar single-cylinder machine in this country, and the new Miehle they were selling was a mere improvement, not on the old Miehle machine, but in mechanical means interposed between the main shaft on to which the power went and the bed motion. The Court then adjourned.

Resuming on Monday, Mr. Walter continued his arguments for the plaintiffs, and said that in 1911 the term Miehle in this country referred to the goods and merchandise of the plaintiffs, and the defendants had no right to come in and sell by advertisement machines in which the words "the Miehle" were made the prominent feature, and where the machines were sold as Miehles, the effect of which was to lead people to believe that the plaintiffs were either the same company or that they had sold their business, or had gone out of the business. In regard to the counterclaim of the American company, it was interesting, in view of the fact that they said they were not selling the Miehle as defined by the agreement, that by way of counterclaim they should set up a claim to the word Miehle in the United Kingdom. They said that the term Miehle as applied to printing presses primarily indicated that they were the manufacture of the American company, and that it had no secondary meaning, except when applied to and descriptive of presses of the old type of Miehle press which was being manufactured and sold by these defendants in Great Britain under the name of the Miehle press; that was to say, the defendants admitted that the term Miehle as applied to those things which the plaintiffs sold did not mean the defendants' goods, but the plaintiffs'. Then the defendants claimed an injunction restraining the plaintiffs from using the term Miehle in relation to presses not manufactured by the defendants. That was rather a curious position to adopt on the part of a person who had sold one a business and given one the sole right to carry it on. They had also given to the English company the sole right in this country to sell these goods in this country.

Mr. Bousfield, for the American company, said the plaintiffs could not take over the benefit of agreements of this sort without rendering themselves liable to the obligations and burdens of those agreements. It was practically admitted that the plaintiffs had repudiated the obligations which would lie upon them if they took over those agreements, and the defendants submitted that the performance of those obligations was a condition of their being able to enforce any rights which they might have under the agreements. By a series of actions the plaintiffs practically repudiated the agreement, and he asked his Lordship to come to the conclusion that the defendants were entitled to accept that repudiation and to say, "Henceforth we do not undertake to be bound by the terms of this agreement." If he were right about that, then questions whether the English company was the alter ego of the American company, or if it was not the alter ego of the American company, that they had been carrying on business in this country, in defiance of the agreement, those matters were of less importance. There was no sale of a business at all, other than a simple license to hold themselves out as having an exclusive right to manufacture, which was something quite different from the sale of a business. After referring to certain agreements, Mr. Bousfield continued: It could hardly have been in contemplation of the parties that, having given the plaintiffs all the materials which had enabled the defendants, with the Miehle Press, in the past successfully to compete with the Century Press, the plaintiffs should straightway proceed on the Continent to use that most perfect press of the defendants to drive them out of the Continent. The defendants had stuck to the spirit and letter of the agreement, but the plaintiffs had always been doing something they had no right to do and infringing the agreement.

His Lordship remarked that the simple question he had to decide was whether the new Miehle was a similar press to the old Miehle. If it had the same movement, although by an improved mechanism, counsel would not dispute that it was similar.

Mr. Bousfield said this was a question not of similarity, but of specific difference, and he proceeded to show wherein the new Miehle fundamentally differed from the old, and was, in fact, of a different species.

Mr. Upjohn followed with his address for the English company. He said he did not deny that the company was promoted by Mr. Bentley, Mr. Kelly and Mr. Washington Wood. (Mr. Kelly was president and Mr. Bentley vice-president of the American company, and Mr. Wood was up to 1910 in the employ of the plaintiffs.) As to the shareholding, Mr. Kelly had 11,000, Mr. Bentley 500, Mr. Washington Wood 3,000, Mr. Buckley 100 and another gentleman 400 shares, making up 15,000 issued shares out of 20,000. These were the only registered members, and it was absolutely untrue to say that the American company had the slightest interest in the shareholding of the English company. It would be ultra vires of the American company either to promote or to hold shares in the English company or to have any dealings with the latter, except to make business contracts. There were five directors of the company, two of whom were officers of the American company, but, so far from those two doing what the statement of claim alleged — managing and conducting the operations of the English company—they happened to be the two directors who took no part in the management of the English company. The business of the English company consisted in entering into two classes of contracts—(1) Contracts for the sale of machines over here or in the colonies; and (2) contracts with the American company for the purchase of machines in order to fulfil the obligations they (the English company) had entered into with British customers.

The hearing was again adjourned.

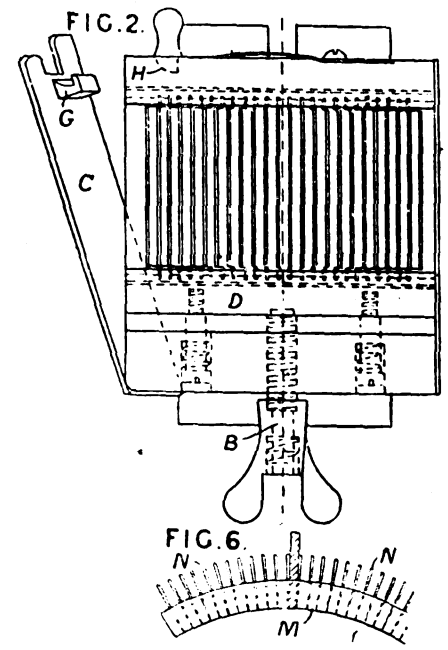
On Tuesday, Mr. Upjohn continued his opening for the English company. He said the American company was not the owner nor was it interested in any stock of the English company. There was no ground for the suggestion that the English company was other than a duly constituted company which as a principal, and not an agent of the American company, had carried on the business of entering into and carrying out contracts to sell Miehle machines to its own customers. It had entered into contracts with the American company to acquire those machines, and in every case the contract was made in America. The English company sent their order there, and the American company sent their cable or posted their letter accepting it there; delivery was taken in Chicago, and the machine was from the commencement of its journey at Chicago at the risk of the English company or the English company's customer. Every kind of expense connected with the transit from Chicago was borne by the English company or the person for whom they made the contract. The true position was that of an independent buyer and independent seller, Counsel then dealt with certain agreements, and argued that not only had there been no breach on the part of the defendants, but that the plaintiffs could not charge them with breach of contract in face of the evidence of plaintiffs' own witnesses.

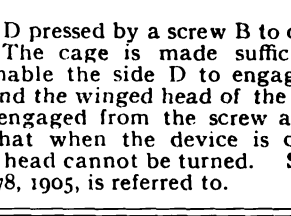
The hearing was again adjourned.

Fudge Boxes.

Under a patent by Messrs. C. H. and A. E. Crabtree slugs for printing late news are held radial by a cage comprising tapered bars N, Fig. 6, attached to curved side pieces M. The cage and slugs are locked up in a fudge box having a hinged lid C, Fig. 2, at the end, secured by a spring catch G, H, and a sliding

FIG. 2.





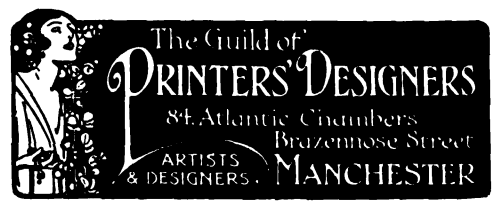


FIG. 6.

locking side D pressed by a screw B to clamp the slugs. The cage is made sufficiently narrow to enable the side D to engage the slugs only, and the winged head of the screw B can be disengaged from the screw and so positioned that when the device is on the machine the head cannot be turned. Specification 17,778, 1905, is referred to.

A Handsome Gift to Rochdale.

Mr. Walter Scott Presents a Crippled Children's Home.

On Thursday last an interesting event took place in the opening of the Memorial Home for Crippled Children, which has been erected by Mr. Walter Scott, the proprietor of the *Rochdale Observer*, in memory of his late wife, to whom has been erected in the entrance vestibule a bronze memorial bearing an enamelled portrait of the deceased lady. This tablet bears the words :—"This Home for Crippled Children was built by Walter Scott, of Highfield, Rochdale, as a lasting memorial to his wife, Ellen L. Scott, who through many years of suffering found her greatest joy in thinking how she might bring happiness into the lives of others."

The Home, which was formerly opened by the Duchess of Sutherland, is situated about three miles from the town of Rochdale, and is built of stone of a warm reddish hue, that harmonises well with the half-timber and plaster of the upper storey. The design is artistic and pleasing as will be seen from the two illustrations given herewith, and the interior has been designed and fitted in a spacious manner.

The mains entrance doors open into a vestibule, which opens into a spacious hall 40 feet by 20 feet with a large open fireplace. The stairway leading to the upper floors, as well as all the other fittings of the hall, are in oak, and the floor has been laid in oak parquetry. The stairs are wide and shallow for the little feet that will have to climb them. The scheme of decoration is a light and cheerful yellow. The frieze is in half-timbered oak and plaster to match the exterior of the building. From this hall, which opens with folding doors on to the terraces, the dining hall, a spacious room measuring 31 feet 6 inches by 21 feet 3 inches, with a large bay window, is entered. The service of the house and the matron's and nurses' sitting-rooms, also the children's playroom (34 feet by 22 feet with bay window) giving on to the terrace, open from the cental hall and are so arranged that the staff can easily overlook every department. A noticeable feature in the dining-room is a large painting by the French artist Flandrin, entitled "Christ and His little Friends." It was exhibited at the Paris Salon last year, and was bought with a view to its being placed in its present position.

The furniture of the dining hall is in oak, and of a character to suit the convenience of the little people who are to use it, *i.e.*, the tables are low, and the chairs made to match. In the school or play-room all the fittings are arranged in the same manner, and have been stained in a bright and cheerful colour. The floor covering is of linoleum, and the walls of this room above the dado rail are covered with a boldly drawn design of a hunting scene, with horses and hounds in full cry. The children's lavatories opening from this room form a vestibule with a side entrance to the garden. On the ground floor will be found a spacious kitchen, with scullery, pantry, and store-rooms fitted with all modern conveniences..

The whole of the south front is so arranged that it can be kept entirely open, and there are arrangements of glazed shutters on runners that can be adjusted so as to partially or entirely screen the beds, according to the weather or particular requirements of a case.

The floors of the dormitories, as of all working parts of the Home, are laid in a material called Sano, which, being worked in a plastic state, can be moulded round all angles, and be carried as in one piece up the walls as skirtings or dadoes, thus avoiding all crevices for dust, and making it possible to "swill" the whole place out at any time with ease and with no risk of danger to the ceilings of the underneath rooms. At the same time the floor is warmer to the feet than if covered with concrete or terrazzo. In all three dormitories there are projecting balconies.

Rochdale Memorial Home for Crippled Children.—North Front

Rochdale Memorial Home for Crippled Children.—South Front.

The rest of the building is fitted in corresponding style. Throughout there is every convenience for both staff and inmates. The Home will provide accommodation for forty or fifty children.

Printers and Profit Sharing.

The Solicitors' Law Stationery Society, Limited.

At a meeting of the staff of the Solicitors' Law Stationery Society, Ltd., held the other day, the general manager (Mr. H. Basil Cahusac) put before the employees the results of last year's trading, and in doing so mentioned that at the meeting held in June last, at which the chairman introduced the profit sharing scheme to them, he explained that it depended to some extent upon themselves whether it came into operation in respect of last year or not. He, the general manager, was pleased to announce that the profits had justified the directors in deciding that all those who had been in the exclusive employ of the Society during the whole of last year, were to have a portion of the profits divided amongst them, and that therefore he had thought it well to address the staff, treating them as shareholders and laying before them the results of the last year's trading. He pointed out that during last year the Society had made more profit than in any previous year. He then proceeded to deal separately with each department of the Society's business, calling attention to the improvements at the Bedford-row premises, the increase in the plant, the purchase of a bookbinding business, and other matters, and then dealt with the profit sharing scheme, and mentioned that the following article bringing it into force, had been approved by the shareholders :—

> Every employee who shall have been exclusively employed by the company during the whole of a year shall receive in respect of such year, for every complete 1 per cent. of dividend paid to the ordinary shareholders by way of dividend for such year in excess of 6 per cent. on their paid-up ordinary share capital, a bonus of 1 per cent. on the total amount (exclusive of expenses) paid to such employee during such year as wages, salary or commission.

He went on to say that the directors had recommended a dividend to the shareholders at the rate of 10 per cent. per annum, and therefore the bonus to the staff would be paid at the rate of 4 per cent. upon what they had earned instead of at the rate of 3 per cent. as anticipated when the chairman addressed the staff in the previous June. He called attention to the fact that 4 per cent. on the amount earned represented more than two weeks' money to every employee who had been in the continuous and exclusive employ of the Society during the whole of last year. He stated that the bonus would be handed to them on the following morning in the form of bonus warrants, which could be cashed at the Society's bankers, but that if any of them preferred to leave their bonus on deposit either temporarily, until their summer holiday for instance, or permanently, it could be handed to the accountant to be placed on deposit at

Digitized by Google

4 per cent. interest withdrawable at any time by giving fourteen days' notice in writing. He stated that the bonus would also be paid to those who had qualified but had left the Society's employ since the end of the year, and in the case of their death it would be handed to their representatives. He pointed out that the Society's scheme differed from many others in that it left the staff free to decide what they would do with their share of profits, and did not compel them to invest the whole or any part of it in the purchase of shares in the company. The amount of their earnings would represent their capital in the company upon which they would receive dividends. To those who were present, but who had not been employed for the whole of last year, or who had come during the present year, he said that he hoped that the payment of a bonus to them was only a pleasure deferred, and in closing, he stated that he gave the staff credit for having earned their bonuses, and trusted that when they handled them in the form of coin of the realm, they would make up their minds that the Society should during this year do as well, if not better, than in last year, bearing in mind that each of them could help, some, no doubt, more than others, but each in his way, to forward the interests of the Society.

A resolution thanking the staff, passed at the annual general meeting, having been read, Mr. H. J. Hundley, the accountant, proposed, and Mr. F. C. Terry (composing department) seconded, the following resolution :—"That this meeting of the staff heartily thanks the directors for introducing the profit sharing scheme and causing it to become part of the constitution of the society, and that the meeting requests the general manager to convey this resolution to the directors." The resolution was cordially received, and was supported by representatives of each department of the society's business, and passed with acclamation.

A vote of thanks to the general manager for presiding at the meeting was proposed by Mr. G. H. Limbrey (works manager), and seconded by Mr. C. Geddes (west end representative), and carried. The general manager, in thanking the meeting, said that he hoped more interest would be taken in the Oyez Athletic Club, and that he would like the time to come when they had a permanent ground of their own, where they could find amusement on Saturday afternoons and holidays. This could only be brought about if keener interest was shown in the club. With regard to the profit sharing scheme, he stated that he had for a long time wished that those employed in the Society could receive some interest in its prosperity over and above their salaries, and was very pleased that the scheme had been established. He added that he would not urge the staff to do their best, as it was in their own interests to do that, and that he thought they knew how to look after such interests.

The Reformed Spelling.

A New List of Mutilated Words.

The Simplified Spelling Board has made its fourth assault on English as it has been written. The board began its propaganda in 1906 with a list of 300 words. Two other additional lists have been issued since, making this the fourth. The members of the board say they have the support of thousands of teachers, clergymen, lawyers, "fysicians," and others.

The combination ch is the first to suffer, and the h is annihilated. Thus "chaos" is set down to be spelled "caos," and "eco" is the familiar "echo," while it is urged to make "school" "scool."

The ch is retained before e, y, and l. Words like "chemist," "architect," "orchestra," and "scheme" are retained as they have been.

The ending ck is attacked. The rule is to drop the k after an unstressed vowel, as the final k has already been dropped in a great many words that once had it. This applies to all words like "derrick," "haddock," "hammock," etc.

The simplification of many monosyllables ending in ck is postponed by the board until the derived forms are agreed upon. Thus "sack" will not be "sac," nor "back" "bac."

A change of wide effect is that of dropping the final e after a single consonant preceded by a short vowel or by any stressed vowel whose sound is not conveniently associated with the silent final e. "Have" becomes "hav," and "live," "forgive," "misgive," and even "are," "gone," and "were."

When the two vowels ea come together and are pronounced as long a before r, the rule is to drop the e. This rule makes "heart" "hart" and "hearth" becomes "harth."

Final ew, which appears in many words like "blew," "grew," "chew," and "threw," is changed to u, so the simplified spellers will write "The wind 'blu.'" When it comes to conjugating verbs ending in ew, like "brew," they will say "I bru," and then "I brued," and "I have brued."

Another e is lost in words ending in ey as an unstressed syllable which sounds like y. "Attorney" becomes "attorny," and "donkey" is "donky."

Then there are to be no more ff endings. One f is considered enough, as "bluff" will be "bluf," "plaintiff" only "plaintif," and the "sheriff" falling to "sherif."

When gh is pronounced as f the board rules that it shall be written f, and where gh is silent both letters are dropped. "Laugh" becomes "laf," and the noun is "lafter." "Cough" is "cof." Where gh is silent, as in "caught" and "aught," the words become simple "caut" and "aut."

When gh is pronounced like n, g is to be dropped, as in "gnaw" and "gnostic." Where gn is pronounced like ein, as in "reign" and "deign" the g is to be dropped.

Likewise when kn starts a word, like "knife," the k is dropped. Thus people would "neel" in church. The k is kept in know and knowledge.

One l of the final ll is dropped, also making a great change in many common words and making many of them puzzling, like prisoner in a "cel" and house on a "hil." Add to these such everyday words as "bel" for "bell," "dol" for "doll," "shal" for "shall," and "sel" for "sell." The board says that this is carrying out a process that has been going on for a long time.

A great many words ending in nced, like "danced," "chanced," and "glanced," suffer a great change in becoming "danst," "chanst" and "glanst." "It is obviously a gain in economy," says the board.

Words ending in oé, pronounced o, lose the final e, and ou where it is pronounced like u becomes u. This rule applies to ou before r, and would change common words like "adjourn," "adjurn," "courage" to "curage," and "journal" to "jurnal."

Ous endings pronounced us drop the o. "Serious" would be "serius," and the list of them has a decidedly Latin appearance. Examples are given of "anomolus," "glorius," "grievus," and "vigorus." Where ow is pronounced like o it is made such as in "blow," "bow," and "crow."

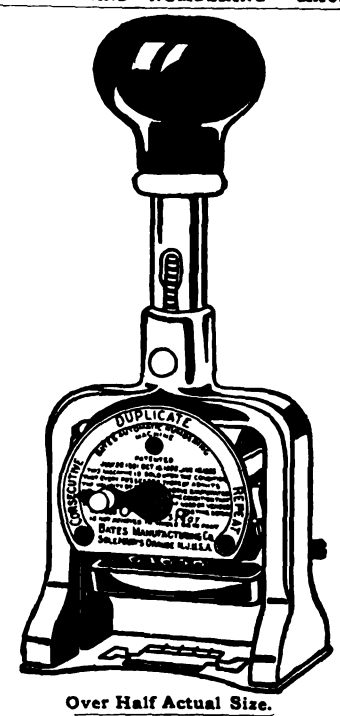
Wherever ph, which appears in a host of words, is pronounced like f it is to be written f. Words in rh, where the h is silent, are to drop the h. Words ending in "some," like "handsome," are to be written ending in "sum."

Words ending in ss lose one s, as the simplified speller will "mis" his train. Words ending in ue after l or r drop the e. The sky will be "blu," and the smoke will go up the "flu."

The familiar wr beginning words like "wreck" will lose the w, and the simplified spelling shops will "rap" up a bundle. One z where two have been used is considered enough, and the bees will only "buz" and the cars "whiz" by.

The double consonant in general is eliminated, and the tide will be at "eb," the "cuf" will be worn. The simplified speller says "wel," and "odd" is "od."—*Fourth Estate.*

FREE SPEECH.—"Free speech" does not mean that you can say what you like at any time. There are seasons, proprieties, and circumstances to be considered. I might, for instance, be a Republican; but if I shouted "Down with the monarchy!" during a Coronation service I should expect to be badly contused. "Free speech" does not mean that a man may say exactly what he likes upon all occasions. It means merely that a man may publicly comment upon the public action of Crown and Government without fear of being punished. But every journalist knows that though a "Free Press" is linked up with the doctrine of "free speech," he may indulge in free speech only at his peril.—Mr. Harold Owen, in *The National Weekly.*



THE late Mr. J. W. Swain, of Leamington, formerly of Stockport, and a proprietor of the *Stockport Advertiser* and the *Cheshire Daily Echo*, has left £8,641.

Bookbinders' Pension and Asylum SOCIETY.

Annual Meeting in London.

The annual meeting of the donors and subscribers and those interested in the Bookbinders' Pension and Asylum Society was held in the Memorial Hall, Farringdon-street, E.C., on the evening of April 23rd, when a report on the past year's work was submitted and the election of officers for the ensuing year took place. Sir George A. Riddell presided, and he was supported in the chair by the officers and members of the committee of the Society. The body of the spacious hall was well filled with an appreciative and interested audience.

The Chairman, in opening the proceedings, said it was not his intention to occupy their time by making any lengthy observations. He had, however, to congratulate them upon the continued success of their most admirable charity. It was one of those charities which had special claims upon their consideration, and, personally, he was a strong believer in supporting charities which were connected with the trade in which one happened to be engaged. He also very strongly believed in supporting charities having for their object the alleviation of the distress of those by whose side they lived from day to day. He was sorry to say a good many people act upon an old adage in regard to contributing for the alleviation of the distress of coloured people in different parts of the world, but when they were asked to make a comparatively small contribution for the benefit of those with whom they were more closely associated, his experience was that they very frequently, to use a common expression, "shell out." (Hear, hear.) "Charity begins at home," and he believed that one's first duty was to endeavour to alleviate the distress with which one was personally acquainted, and he could only say that any charitable effort made in this way was productive of more good, not only to the recipient, but generally to the person who bestowed the charitable contribution. After all, happy faces and kindly ways and kindly smiles were the things which were most pleasant to behold in this somewhat troublesome and troubled world. The charity which they met there that night to support was one solely for the benefit of those engaged in the trade with which they were all connected, but with which he was connected in a remote way, and it was a charity to be admired and helped. He had always found the binders extremely kind and honest gentlemen and extraordinarily keen in matters of business. (Laughter and applause.) As they had a somewhat lengthy agenda to go through, without further ado he would call on the secretary to read the annual report.

Annual Report.

Mr. W. T. Rawlinson, secretary, read the report to the donors and subscribers as follows:—

LADIES AND GENTLEMEN,—In recording the results of the Society's work for the past year, it is highly gratifying to your Committee to recognise the growing interest in its welfare, justifying the hope to such an addition to its resources as may enable it to cope more completely, than hitherto, with the demands made upon it.

One of the most notable events in our Society's history was the generous action of Mr. H. F. Parker, secretary of the Printing and Allied Trades' Charity Sports Association, in securing the services of Mr. Kennedy Jones as President of the Swimming Section, to raise the sum of £500 for the purpose of endowing one of the homes in our Asylum. Your Committee, to show their gratitude and appreciation of such kindness coming from the ranks outside our trade, agreed to provide a suitably inscribed tablet, naming one of the houses in the President's honour.

In fulfilment of the above, Mr. Kennedy Jones attended the Asylum on Saturday, February 22nd, and, in the presence of a large assembly of committeemen and friends, unveiled the tablet, and expressed his pleasure at all he had seen, and said he felt that his humble services had been well employed in aiding such a grand work. He was glad to see the inmates looking so well and contented. That was a sign that this institution was controlled wisely and efficiently, and he expressed the hope that many more tablets would be placed over the other cottages in imitation of the fashion which he had the pleasure of now instituting.

To celebrate the occasion, a concert was held in the evening, at the Manchester Hotel, Aldersgate-street, E.C., Mr. Kennedy Jones presiding, who, in response to a toast, said that when he arrived home from the proceedings of the afternoon, his wife wanted to know what had kept him so long. When he told her what he had seen in the Ball's Pond-road, she became quite interested, and handed him a cheque for £150, the estimated cost of an additional pensioner for the first five years, to be called the "Mrs. Kennedy Jones, Pensioner," thus enabling the Committee to elect five this year instead of four, as previously arranged.

The trustees have duly invested the £500 in New Zealand Inscribed Stock at 4 per cent. During the year, a propaganda Sub-Committee was appointed to dispel the apathy that was found to exist among a large number of the male members of our trade. Circulars were sent to all those shops that were without a collector, also to three London branches of the trade union, and the Amalgamated Bookbinders' Club, asking them to receive a deputation.

The Committee regret to find that so few of the shops responded, but in the case of the branches of the Union and the amalgamated club the deputation were well received, and after the needs of the Society were fully explained in each place it was resolved that the joint executives circularise its members, inviting them to become subscribers, and pointing out the advantages to be gained in old age, by becoming parties in this splendid inheritance from our forefathers in the trade.

We have to deplore the loss of a most esteemed and highly respected colleague, Mr. C. R. Ponder, who for twenty years served on the Committee, whose whole heart was in the work up to the end, always earnestly supporting every movement for the advantage of the Society.

The following pensioners have passed away during the year, viz.:—Robert Crockett, May 1st, age 76; Elizabeth Coleman, June 4th, age 75; Henry T. Phillips, September 9th, age 82; Michael Hobbs, December 19th, age 75; Mary Ann Horrigan, March 17th, age 53; and Sarah C. Burton, April 4th, age 75.

The Christmas Distribution has become so popular, both in and out of the trade, that the Committee were again enabled to transfer the sum of £62, making a total of £2,566 4s. 5d. from this source.

The work of alleviating the distress of the unsuccessful candidates was continued by the Supplement Committee. The assistance from this source has been of great help to those candidates whilst waiting for election.

The excursion of the inmates to the Cockfoster Inn, at High Barnet, in August, was carried out in the usual praiseworthy manner by the Only-a-Penny Committee, and those pensioners who, through ill-health or failing strength, were unable to accompany the party, received 4s. each, and at Christmas time the surplus was divided amongst the whole of them.

Miss Hendley, of Wisconsin, U.S.A., has again favoured us with a donation of £1 in memory of her father's birthday.

The usual supply of coals to the pensioners has been granted.

In closing the summary for the past year, your Committee express their most sincere obligations to those ladies and gentlemen who so kindly undertake the onerous duty of shop collector, as but for their untiring zeal in gathering the week's pence, the Society would be in a far less prosperous condition.

Now, in conclusion, your Committee ventures to hope that they do not appeal in vain, for it is painful in the extreme to have to disappoint so many of our needy and deserving applicants year by year, which we are of necessity compelled to do, through the insufficient support from the increased number of workers in the trade, for your Committee, out of sympathy for the many applicants for its benefits, have elected more for some years past than the current income would meet. The pensions alone for the past year having reached £1,054, out of a total income of about £1,300, they now find themselves with a serious deficit. Therefore, unless some spontaneous help is forthcoming, there will be no alternative but to call upon the Trustees to draw upon the small capital to meet the claims of the pensioners. With the foregoing facts confronting us, we ask that apathy, neglect and want of thought may be discarded, and that each may be actuated by the idea that to

> "Me let the tender office long engage,
> To rock the cradle of reposing age,
> With lenient acts extend a mother's breath,
> Make languor smile, and smooth the bed of death."

Continuing, the Secretary said he begged to move the adoption of the report, and would be glad to hear mild criticism. (Laughter.) He might say, not that he was in the least afraid, what was wanted was more help than criticism.

Mr. S. Stubbings seconded the adoption of the report. He said one of the important facts contained in the report was the action of the sports committee. The donation which they received was admirable help and one which they could not forget and for which they were deeply indebted. On top of that came Mrs. Kennedy Jones' £150, which was greatly appreciated. They wanted a few more people like Mrs. Kennedy Jones. (Applause.) He thought that when the report was examined, and particularly the financial report, they would find that the Society was very economically managed. The great bulk of the money went on pensions, and, of course, the upkeep of the buildings had to be closely watched. Of course, it was a great anxiety to the committee when they could only elect five deserving persons this year instead of fifteen deserving ones. He only wished the trade would become more interested in the matter. In the election that night the majority were women, but he must say that it was their bounden duty to look after the members of their trade first. He hoped the large number of women engaged in the trade and the men also would rally more to the support of the Society in the coming year.

The report was unanimously adopted when the resolution was put to the meeting by the Chairman.

Thanks for the Officers.

Mr. G. W. Knecht proposed the best thanks of the meeting to the vice-presidents and officers of the Society—the trustees, treasurer, auditors. He said that every ship had to be managed by officers, and, therefore, their "ship" was managed by officers who held office for a long time owing to the very capable way they performed their duties. (Hear, hear.) There were the vice-presidents, whom they could not do without, and then the trustees, and Mr. Bailey, the treasurer. If anybody had the welfare of the Society near his heart, it was Mr. Bailey. (Hear, hear.) Then there were the auditors, who tried to find out all the mistakes, and he was sure they should thank all these gentlemen very sincerely for the services so willingly rendered the Society. (Applause.)

Mr. W. Coffey seconded the resolution, and said it was matter of great anxiety to every member of the committee to know that sufficient provision was being made for those depending on the resources of the Society after being elected, and in that anxiety they always found a large amount of help from those gentlemen, to whom they owed so much, for giving voluntary services year after year. (Applause.)

The resolution was carried with enthusiasm.

Mr. Frank E. Bailey, Treasurer, returned thanks, and said so far as he was concerned he would always try and do his best. Having referred to the cordial relations he had always experienced when brought into contact with the trade workers, he suggested that in order to help the funds of the society each worker should give the pay of two hours' work, or whatever could be agreed on, once a year voluntarily. He merely threw it out as a suggestion, because if it was adopted the scheme would bring in quite a substantial sum to the society. It worked well at his place, and with all the workers in London adopting it they would have excellent results.

The weekly "shop" collectors were next thanked by Mr. T. G. Collier, who moved a resolution to that effect. He referred to the very admirable suggestion made by Mr. Bailey, and expressed the hope that the bookbinders in London would give the society more help than they were doing at present, considering the numbers that were employed in the trade. To the "shop" collectors they were very grateful for all their help, and for

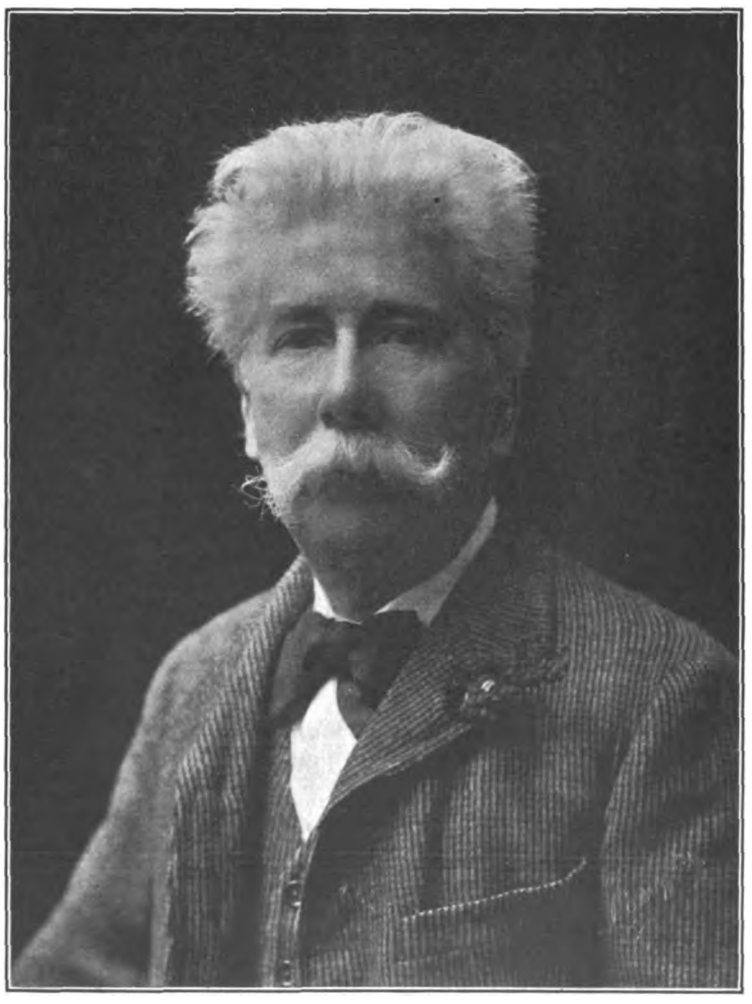
Readers' Pensions Committee.

ANNUAL DINNER.

"Toby, M.P.," on the Printers' Reader.



The twenty-third annual dinner of the Readers' Pensions Committee, in aid of pensions for readers and their widows, was held at the Holborn Restaurant (Venetian Chamber) last Saturday evening, and signalised the completion of the sixth Readers' Pension, five having been founded at a cost of rather more than £2,500, and placed in charge of the Printers' Pension Corporation, since the formation of the Committee in 1888. The chair was taken by Sir Henry Lucy, and the company present, numbering nearly 200, included Sir George Riddell, Mr. E. T. Reed, Mr. Albert Visetti, Dr. J. Bass Mullinger, Mr. E. Phillips Oppenheim, Mr. James Baker, Mr. G. A. Aitken, M.V.O., Mr. Fabian Ware, Mr. Francis H. Skrine, Professor Henry J. Spooner, Mr. Thomas Seccombe, Mr. W. H. Helm, Mr. Vernon H. Rendall, Mr. G. L. Apperson, I.S.O., Mr. Edgar Harrison, Mr. Victor B. Harrison, Mr. J. Pratt, Mr. G. F. Wilbraham, Mr. Horace Cole, Mr. Percy French, Mr. E. W. Chicken, Mr. F. B. O. Hawes, Mr. F. Hedger, Mr. S. Jarden, Mr. Joseph Mortimer (Sec., Printers' Pension Corporation), Mr. T. E. Naylor (Sec., London Society of Compositors), Mr. R. Freeman, Mr. W. H. Christopher, Mr. C. H. Freeman, Mr. A. J. Russell, Mr. S. F. Crampin, Mr. T. Sanders, Mr. J. Chandler, Mr. S. Andrewartha, Mr. J. Feldwick (Chairman of Committee), Mr. John Randall (Treasurer), Messrs. W. A. Perkins and W. H. Shortell (Hon. Secretaries), Mr. J. Cannon, Mr. T. M. Stamp, Mr. E. W. Whittle, Mr. J. Partington, Mr. J. A. Goodall, H. J. Simkins, W. L. Bower, etc.

"Literature and the Press."

Mr. ALBERT VISETTI, in proposing the toast of "Literature and the Press," said he regarded the Press as one of the greatest powers in the modern world, and one of the strongest influences in the life of our times. There were very few questions in which it did not take an intimate concern. In one way or another it touched us all, and we owed to it a debt of gratitude which could not be too frequently acknowledged. Perhaps we could best realise how much we owed to it if we could imagine what life would be like with no newspapers, and if we pictured a world in which the Press had disappeared. He took it it would mean a world in which civilization as we knew it would be impossible. There would be no interchange of ideas, no chance for the communication of thought, and progress would be arrested. We should be working under difficulties which would hamper us in every direction. From his own point of view they would miss most of all the influence of the Press as a guide, for he attached great importance to press criticism; it was intelligent, instructive, and of high educational value. It chastised or encouraged them, but in any case its influence was very helpful. He attached the greatest importance to the influence exercised by the Press in educational questions. He would have it intelligently and seriously interested in artistic education. He would have it remember how by the use or neglect of its powers it could make or mar the prospects of some great movement which was designed to benefit the whole nation. And what was true about music applied equally to all the other arts. Their prosperity, their development, their progress depended very greatly upon the way they were treated by the Press, upon the sort of attention given them by the critics whose opinions were put before the world through the medium of the Press. To the care of the Press he commended the arts in sincere faith that the great traditions of the past would not be forgotten. In asking them to honour the toast it was his duty to propose he asked them to honour not only the record of the Press as it had been, but what he knew would be its record in times to come. They drank to its great, noble and dignified past, but they drank also to its even greater future. (Applause.)

Dr. J. BASS MULLINGER, in responding, spoke of the difficulties under which the art of printing had lain in past times, and referring to the gallant fight made by William Caxton at Brussels for the preservation of his art under very difficult circumstances, and his escape to England there to develop it at Westminster, he said this event had always appeared to him symbolical of the difficulties under which literature itself had had to fight its way.

Sir GEORGE RIDDELL, who also responded, said he was very much obliged to Mr. Visetti for the very graceful and courteous things he had said with regard to the Press. Formerly it was the practice to oppose and imprison editors and newspaper proprietors; now it was the custom to cover them with a good deal of flattery. He was not sure which was the better thing, imprisonment or flattery. He sometimes wondered what would happen if he saw some distinguished members of his profession imprisoned for just say fourteen days. He was certain of this, that when they came out of prison they would make things hum and the Press would assume such a vigorous and virile attitude as it had not assumed for a good many years. (Laughter.) Addressing the printers' readers, Sir George Riddell said: You are "the watch-dogs of the Press," you are the gentlemen who do a great deal in protecting the unfortunate newspaper proprietor and his far too small profits from the results of the law of libel. (Laughter.) Continuing, Sir George said he was a trade unionist. There was only one occasion on which he had had the opportunity of seeing more than about three readers at one and the same time, and that was an occasion on which he had the privilege of meeting what was called a deputation from the Readers' Society, who came to see the newspaper proprietors with regard to the interesting question of wages and conditions of labour. He had met a good many trade union deputations, and he generally got on pretty well with them, because he thought they recognised he was a similar sort of person as themselves, more or less. But on this occasion he confessed he was very much put about. The gentlemen who came to see them addressed them in very dignified language, it was not at all forcible, and they were extraordinarily polite. They put their points in the most delightful manner, and after the deputation had left

Langfier, Ltd., Photo.

SIR HENRY LUCY.

Digitized by Google

them they felt they had conferred almost a privilege on them by being good enough to come and see them. (Laughter.) He enquired if that was a trade union, and the reply was, "Yes, it is, but these are some of the aristocrats of the printing trade." (Renewed laughter.) The Press to-day was a great commercial institution, and the readers exercised perhaps one of the most important functions which existed in the newspaper office. Whatever they might think about the manner in which newspapers were conducted, whatever they might think of the editors, of the sub-editors, of the news editors, and of the newspaper proprietors, there could be no doubt of this, that the extraordinarily correct manner in which the newspaper press in this country was read was little short of a marvel. When they considered the speed with which the type was set and the rate at which it was read, he thought it was absolutely amazing that so few errors appeared in the papers. (Applause.) Money was an important thing in business; they were not in business for the benefit of their health, but to make money. It was quite consistent, however, with making money and position to live on happy and friendly terms with those engaged in the business with which they were occupied. Nothing gave him more pleasure than to come to a gathering of this sort, and to sit down side by side with the men he was working with day by day. A very clever Australian poet had said:—

All the world is full of trouble,
This thing stands alone:
Kindness in another's trouble,
Courage in your own.

One of the most delightful things in relation to business was to be on friendly terms with those with whom you are doing business, and to join in the hundred and one little functions and institutions which were inseparable from and properly connected with any well-conducted establishment. (Applause.)

Sir Henry Lucy's Tribute to the Reader.

The CHAIRMAN, in submitting the toast "The Readers' Pensions," said he had been endeavouring to express to himself how it came about that he should have the honour of presiding at this interesting meeting, and he had come to the conclusion that it was due to the fact that few men had been permitted to have more extensively engaged the assistance of the printer and the supervision of the printer's reader. When it was desired to give an idea of exceptional length in any particular relation it was said that the substance, whatever it might be, would go round St. Paul's Cathedral many times. If the galley proofs of all he had written for the press and the public during the last forty years were gummed end on end and wrapped round St. Paul's Cathedral he did *not* think they would find a square inch of the sacred edifice in view. Time was when he turned out his copy with his own hand. From the bottom of his heart he pitied any survivor of that time. He fancied a large proportion of them died in the course of their experience. (Laughter.) Some years ago he saw a periodical written and set up by working printers, after the familiar fashion of the waiter who, having a rare holiday, went out to assist a friend to serve a dinner. These gentlemen devoted their spare time to setting up each other's copy. In a particular number of the periodical sent to him there was a too flattering account of his career. It illustrated by facsimile a sheet of his handwriting abstracted from an article contributed by him to the *Daily News*. Whether it was in a moment of personal devotion, or in a flash of extreme rage, that the compositor had taken home with him this precious relic to shave with, he did not know. He remembered it was fearfully and wonderfully scrawled. More closely than anything it resembled a collection of spiders, who had been dining out at an annual Pension Committee dinner, trying to find their way back at break of dawn. (Laughter.) His handwriting was a source of constant trouble to his old friend and colleague, Sir John Robinson, manager of the *Daily News*. He frequently remonstrated with him on the great amount of time occupied in deciphering his copy, which nearly led to the unpardonable crime of losing the post. He had confessed that his handwriting in its day was not so good as it might be. Allowing for the possibility of personal prejudice, he could honestly aver that Robinson's was ever so much worse. (Laughter.) In the matter of illegibility there were only three men to his knowledge who sinned in equal measure. One was James Payn, of whom an embarrassing correspondent said that at first sight it seemed beautiful writing, and it was only when you came to examine successive sentences that you discovered how awful was the impression. Mr. Mudford, who was taken from the Press Gallery to be editor of the *Standard*, a step that was justified by extreme success, was another. His signature was a marvel; the initial letter might have been, as the Catechism puts it, "M. or N. as the case may be," and what followed was simply a straight line. There was no approach to the formation of a single letter. The third was Colonel Fred Burnaby, whose handwriting suggested the use of a sprig from a birch rod dipped in a blacking-pot and scrawled on his ride to Khiva. (Laughter.) After his death there were found among his literary remains the notes of a novel. It was called "The Radical." As far as he (Sir Henry) could make out it was a vigorous assault by a red-hot Tory on Mr. Joseph Chamberlain. It was written in the eighties at the time when the Member for West Birmingham was carrying through the country the flaming torch of the "unauthorised programme." As one of Burnaby's nearest and oldest friends, he was invited by the family to prepare the book for publication. He spent some time on what was a labour of love, but he had to abandon the task, baffled by the handwriting. (Laughter.) At one time Sir John Robinson sent to him a more than usually warm complaint about his handwriting. In the heat of his wrath his own writing became something worse than usual, and there were a few consecutive words he failed to decipher. He pasted a sheet of paper over the note, cutting a hole in it disclosing those three words, and took it down with him to the office. Having humbly acknowledged his own shortcomings, he produced this shrouded note and asked Sir John Robinson what the three words were. He glared at it through his glasses, turned it upside down, and finally admitted he could not say. Removing the covering sheet he showed him how in the matter of calligraphy he had nothing to boast about, and he never said anything again about his (Sir Henry's) hand-writing. As a journalist of the past he referred to this with the object of justifying his appearance in the chair that night. In those far-off days he sinned daily and nightly against the printer, and nightly and daily he was saved by the proof-reader. He trusted he would not be exciting anything approaching professional jealousy when he said that the best reader he had ever had was his wife. She read every proof of his multitudinous writing before it went to press, making corrections and suggestions which he saw, from the expressions in their faces, they were about to say accounted for the measure of success in his writing of to-day. He remembered only one occasion when there was an oversight. They might be sure, with the meanness of man, he made the most of it. (Laughter.) His wife said she found the article so interesting that, carried away by the plot of the story, she quite forgot she was reading a proof for the press. The gentlemen present that night—whom he was so proud to meet—who with the assistance of a small boy read the proofs, were, he expected, above weaknesses of that kind. He did not know whether, when they performed their high function, they permitted themselves to be swayed by a consciousness of the merits or demerits of the manuscript. He hoped not, for if they were subject to emotions of that kind, they must, considering the quantity of printed matter that came into their hands, suffer sorely in the course of a twelvemonth. Those present, whether writers for the Press or readers in the sense of purchasing journals and books, were there that night to give evidence in a practical form of their sympathy with and their gratitude to a section of the great army connected with the Press who were the most unostentatious and the most indispensable. Donors to the fund at the Pensions Committee were encouraged to liberality by a knowledge of the fact that it was not a charity in the sense implied by the giving of alms; a considerable portion of the money with which the Pensions were formed was subscribed by the general body of proof readers, of whom only a small percentage could hope to personally benefit by the pensions founded. Sir Henry concluded by referring to the special incentive to the provision of this sixth pension in the fact that among those who submitted themselves at the Pension Election last March was the late Mr. William Hilton, through whom the first Readers' Pension was formed. (Applause.)

Mr. J. FELDWICK, in responding, alluded to the loss the Committee had sustained in the death of their late chairman, Mr. William Hilton, who had put in such valuable work since the founding of the pensions. He thanked Sir Henry for the kindly way in which he had proposed the toast. There was great need for these pensions, and he was glad to say that, with the assistance of friends at the last election, they secured the return of four candidates. They based their work on the principle of self-help; everyone who participated must have subscribed to the parent body and to the Committee, so that it was not entirely asking for charity. The expenses were kept down to the lowest possible point. Last year the executive expenses amounted to £2 5s. They hoped with the assistance of friends and readers in the various offices to continue their work in the time to come. Concluding, Mr. Feldwick announced some additions to the Fund, including a donation of 25 guineas from Sir Henry Lucy and one of 10 guineas from Sir George Riddell, the latter having consented to take the chair at their dinner at some later period.

The toast of "The Visitors" was given by Mr. W. A. PEKKINS, who said he could not allow the occasion to pass without adding his testimony to Mr. Feldwick's on the loss they had sustained in the death of Mr. William Hilton. He had followed him in the office of one of the honorary secretaries of the Readers' Pensions Committee, and he was his immediate successor in perhaps a larger sphere, on the council of the Printers' Pension Corporation. He testified to the large amount of work he had done in the past for this organisation, and in doing so he said that no matter how much he might wish to follow his example he could never hope to achieve as much as he had performed. He also referred to the absence that night from the same cause of the late Mr. Kirby, who had been a consistent supporter of their organisation for a large number of years. He expressed the thanks of his fellow officials and the members of the Committee to those gentlemen who came year after year and supported them by their presence and contributions. They looked upon it as a great honour and as a great privilege once in the year to come in association with the gentlemen in other walks of the profession when they condescended to dine at the same board and express sympathy with them and their work.

Mr. E. PHILLIPS OPPENHEIM and Mr. G. A. AITKEN replied for the visitors, and the concluding toast, that of "The Chairman," was proposed by Mr. JAMES BAKER, who asked the company to "drink to the continued juvenility

of Toby, M.P." The toast was received with musical honours, and the Chairman briefly replied.

An excellent musical programme (under the direction of Mr. G. Buck) was carried out during the evening, comprising a pianoforte selection by Mr. Turle Lee, songs by Miss Jessie Reeve and Mr. D'Arcy Woollven, violin solos by Mr. Eugene de Meier, and humorous songs by Mr. Geo. Buck, each item being much appreciated.

The donations and subscriptions to the fund to complete the Sixth Readers' Pension amounted to a total of £248 9s. 6d.

Printers' Managers and Overseers ASSOCIATION.

BIRMINGHAM AND DISTRICT CENTRE.

At the April monthly meeting of this Centre, held at the Woolpack Hotel, Moor-lane, Birmingham, after the usual business of the evening, Mr. A. J. Rowley, of London, delivered a lecture, entitled "The Chemical and Physical Properties of Materials used in the Manufacture of Yellow, Red, and Blue as applied to Letterpress, Litho and Offset Printing." The President, Mr. H. B. Lane, occupied the chair, and there was an attendance of forty members, including Mr. Carr, of Messrs. Carr (Saltley), Ltd., and Mr. Terry, of the High Pressure Gas Co., Leamington.

The lecture was illustrated with several interesting chemical experiments and the exhibition of material and diagrams. Mr. Rowley, ably assisted by Mr. Carr, exemplified the action of colours by precipitation, and so interesting were the numerous experiments that many important points, owing to the shortness of time, were deferred for another lecture early in next year.

Mr. Rowley began by defining the terms used in colour manufacture, the first being Decomposition. In its application to rock, he drew attention to the granite rocks of Cornwall and traced what happened to them in the course of time, and what substances were formed by their slow but sure decomposition. He said: The granite rocks are composed of the mineral, quartz, mica and felspar. The cause of decomposition of granite rock is that the mineral felspar is very susceptible to the action of carbonised water, *i.e.*, water which contains carbonic acid gas, Co^2. Assuming that such a water has been flowing through the bed of these rocks for a number of years, and that the felspar has been gradually decomposed into the well-known substance called china clay, the chemical composition of which is silica and alumina, while the chemical composition of felspar is alumina, silica and potash, the potash being soluble in water, is gradually dissolved out of the felspar, and flows into the springs which rise in the granite, leaving the alumina and silica or china clay behind.

Turning to another well-known mineral, iron, Mr. Rowley said: This metal is also decomposed by the action of carbonic gas and water into iron oxide or rust, which is capable of giving a reddish brown stain to china clay. If you can imagine a stream of water flowing into the basin-like cavities that have been made in the rocks by the decomposition of granite into china clay, laden with oxide of iron, remaining there for a very long period it gradually but surely turns the china clay into a reddish-brown substance called ochre and sienna. If again the mineral manganese should be present as well as iron, the action of carbonised water also decomposes this metal, which gives a deeper stain to the china clay and is called umber, or a natural colour. Ochre, sienna and umber contain all the substances which we have traced from the mineral world. The ochre being light in colour contains less iron than sienna. Umber being the darkest in colour contains both iron and manganese. By the decomposition of rock, iron and manganese we obtain earth or natural colour.

Now let us examine the physical properties of these colours. I do not think that anyone could state that they were good working colours by themselves as far as printing is concerned, but with decorators they form very useful colours on account of their cheapness. We will endeavour to trace why the earth colours are not satisfactory printing colours. To do this we must inspect the respective minerals of which the colours are composed. First, we examine the quartz which forms the base mass of the rock. This is not affected by the decomposition and does not enter into the colour. Second, mica, which has very wonderful properties in resisting heat, also does not enter into the natural colour. Third, felspar is the one we can give our attention to. Its decomposition forms silica and alumina, the latter being used as a base in the making of lakes. Silica forms, in various combinations, the second abundant portion of the earth's crust and is quite crystaline. When we come to think that white sand is almost pure silica, one cannot wonder that earth colours do not make good printing colours. Most printers, I think, would express their opinion that sienna and umber are somewhat sandy and difficult to work. This is always the case with all colours that have a tendency to form crystals. This happens in lakes and dark yellows through faulty making.

Having traced the formation of earth colours, Mr. Rowley proceeded to explain the process they undergo to make them marketable, known as levigation, a process which, he said, was all-important to any colour, whether earth or chemically prepared, the success of the latter entirely depending upon the proper washing. He continued: The system of washing adopted for earth colours to free it from foreign substance is on the principle of gravity in water, *i.e.*, a stone will sink to the bottom of water quicker than sand, and, as it is only the finest particles that we require for printing purposes, you can no doubt form some idea of the tremendous amount of water used in securing these fine particles of sienna and umber. The work is carried out by a series of tanks connected by troughs one with another. The current of water is regulated so as to increase or decrease the speed of the current. On the crude umber, sienna or ochre being thrown into a tank of water that is constantly agitated by mehanical means, the finer particles of colour come to the top, and, if the water is constantly running, they would overflow with the water, to be carried down into the next tank, and so on until it reached the fourth thank, where only the finest particles would be found. These are the particles which we as printers would obtain for printing purposes.

Iron has another property which alters the shade of its colour. When subject to heat in a properly constructed furnace it gradually turns from a pale yellowish brown to quite a warm brown, and is termed burnt umber, sienna, ochre or raddel. For instance, if you were to put some sulphate of iron on a plate over a bansen-burner flame you would obtain what is termed in the painting trade "purple brown."

Before directing attention to chemically formed colour, the lecturer explained that colours have a definite chemical combination. It is not a case of adding so much more stain to the base of a colour if you wish it to be stronger in tone, because in the case of sienna if double the amount of iron was present compared with china clay it would not be one shade stronger in colour, because the china clay only absorbs the chemical quantity and no more. Next, explaining the term, "precipitation," Mr. Rowley said: In colour making, when two known solutions are mixed together, a reaction sets in, the result of which is that we get, instead of a solution, an insoluble body quite different to either of the solutions, called the "precipitate," which the lecturer illustrated by chemical experiment, dissolving white lead in nitric acid, then adding sulphuric acid, the precipitate obtained being sulphate of lead. Mr. Rowley also exemplified the action of sulphur on white lead by adding some ammonium sulphide to white lead, the whole mass turning distinctly black in colour, designated as lead sulphide. This action was known to the lecturer to occur when stoving flake white in stoves (heated by coke fuel) for drying the colour in tin printing.

The base of colour in his opinion is a very important item to printers, because it is that part of the colour which governs to a great extent the good or bad working properties of a printing ink. These bodies consist of such substances as barytes, white lead, red lead, orange lead, alumina, artificial barytes, lead sulphite, gypsum, whiting, china clay, zinc white, lithopone, calcium, and many others, samples of which were passed round.

Having dealt in detail with some of these bodies, Mr. Rowley described the various pigments. Yellow pigment, the staining power of which is bi-chromate of potash, is manufactured from chromic iron stone by calcing with Chili saltpetre. Three shades of the colour were struck on a lead base showing lemon, middle and orange. The precipitate of chrome yellow could be seen immediately the solutions were mixed. To illustrate lake Mr. Rowley struck a deep red on an orange lead base, using the aniline dye, eosine, as the staining power, making a very brilliant red. Had this been struck on a base such as alumina this would have been a transparent red or lake. The staining powers of lakes and red are made from a by-product of coal, with which Mr. Rowley fully dealt. Other pigments dealt with were ultramarine, or lapsis lazuli, found in very small quantities in Persia, China and Siberia, mixed with earthy matter from which it is separated by mechanical means; artificial blue ultramarine, made by mixing coal, soda, rosin, sulphur and china clay, and bronze blue, made from sulphate of iron and prussiate of potash with the addition of an oxidising agent, a sample of which was made.

Concluding, Mr. Rowley said: In taking a general survey of the colours I have before me it is not possible to say in the time left all I would like. It was my intention to deal with the colours quite fully, that is, in pulling them to pieces to find their constituent parts chemically, then rub out with varnish on to glass squares, which I have brought with me, to find their transparency, and by adding a given quantity of white to test their strength or staining power. By these methods one can arrive at the quality of a colour. I have also a collection of three-colour prints with their corresponding colours pulled on paper. I can assure you I am yet to be convinced that any three so-called standard colours could produce the force of colour shown on the cards I place in front of you, which are printed from an offset machine on a mounted pulp board. I have also samples of direct photo or zinc in three colours, and considering the plates are just in the rough without any fine etching I think the results are good. These are also pulled from offset machine.

Mr. Carr, in a few remarks, expressed the pleasure the paper had given him, and hoped to be invited to the next, which Mr. Rowley promised for a date early in 1914.

A cordial vote of thanks to the lecturer was proposed by Mr. Wilde, and seconded by Mr. Broughton, and Mr. Rowley responded concisely owing to the late hour of the evening.

The Factory Acts.—Last week the Prime Minister received at the House of Commons a deputation representing the Women's Trade Union League, the National Organisation of Girls' Clubs, and other bodies, who desired to bring to his notice a variety of questions concerning accidents in factories, the Truck Act, women factory inspectors, overtime, and other matters. The Home Secretary and Lord H. Cavendish Bentinck, M.P., were also present. The principal request was for the appointment of more inspectors, and the Prime Minister replied that as an old Home Secretary he had never ceased to take an interest in these and similar subjects. Looking back over a great number of years very large progress had been made, and one of the greatest reforms was the institution of women inspectors, of whom there were none when he went to the Home Office. At the present moment there were 18 inspectors, and he hoped they would get more, as this was one of the best safeguards for the proper administration of the Factory Act.

Printing in Relief.—The following process has recently been patented in France by Mr. A. C. Duterte. It is claimed that movable type and vignettes of every kind and style can be utilised, as also all dimensions and bodies, in lead, antimony, copper, bronze or any other metal or alloy, stamped or engraved inversely to the ordinary printing type. The process is applied as follows: Supposing there is a form from which a proof has been pulled in the usual way. This proof will then have to be printed a second time in another form containing the inverted type previously mentioned, and from which a first impression is obtained on a flong or paper pad placed on the platen of the printing press and under the tympan. All that is required is to print the sheet dry under the first impression. The second form alone can be used, from which a proof is pulled, inked after each copy, on the tympan of the press, under which a flong or pad is placed to receive the impression. The sheet is then laid and will be printed in relief owing to excess of ink. In this way, it is said, printers can obtain impressions in relief, with movable type, in printing presses.

A Belgian National Federation of Lithographic Workers came into existence at the commencement of this year, and has already about 700 members, of whom 100 are females. The weekly subscriptions range from 3d. to 1s. per week. Photo-engravers are eligible for membership.

The Use of Printing Inks.

Writing on this subject, in the *American Pressman*, Mr. Eugene St. John says that:—When one ink is superposed on another, the first ink must be dry, else the contrast will be lost. If two plates are made from the same negative, one to be printed over the other, the impression of the first plate, say on orange or buff, must not only be dry before the impression of the second plate is superposed, but it should be mixed with a sixteenth part of paste drier, which will not only cause the orange or buff to dry smooth, but will also cause it to dry on the surface. Otherwise the orange or buff may chalk off because its varnish has penetrated the paper too freely. For this sort of work black or blue-black over buff is a pleasing combination. There are various mixtures which yield buff. Two good ones are (1) white, English vermilion and golden yellow, and (2) white and deep orange. A little black may be added if a darker buff is preferred.

The black used to print the second impression should be a very dense, deep black of utmost covering power. Such a black may be mixed from cover black and reflex or roslyn blue. When two impressions are made from a single plate, green, brown or orange over black yields a pleasing effect. In this sort of work it is customary to run the black full colour and tint, the second colour with gloss varnish or gloss paste, the latter being the better. One make-ready, of course, answers for both colours. Paste drier should be added to both the black and the tint. The black must be dry before the second colour is printed and hard, oily slip-sheets should be used. The sheets must not be stacked too high lest they stick and peel. For the tints either light green lake, burnt sienna shade of brown or light orange may be mixed with the gloss paste.

The mixing of tints, while dreaded by many pressmen, is not at all difficult provided an eye for colour is not missing.

In most tints the predominant colour is apparent and in most cases it is only necessary to add a minor portion of the predominant colour to white to get the tint. Should this fail the result will be near enough to sample to be matched, to suggest the necessary addition, be it black, blue, red, yellow or green.

Acorn brown is a tint of chocolate, for example, and one needs but to look at a sample of acorn brown to see that it is a pale chocolate. Since white is commonly used to pale a colour what is suggested but to add chocolate to white until acorn brown is secured?

Alabaster is a tint of yellow, a pale yellow. This is at once apparent. Yet alabaster inclines neither to orange nor green, so medium yellow and white are suggested as the component parts of alabaster, and such by trial we find to be the case.

Apple green at once suggests a dull green. Looking around for a dull green, we find chrome green the nearest to apple green, the latter being paler. We add chrome green to white and get apple green.

Apricot colour at once suggests reddish orange, and if we add deep red to yellow or medium red to orange we get apricot colour.

Azure blue suggests light blue, and if we add ultramarine, the lightest blue, to white we get azure blue.

Buttercup colour at first glance appears a pale yellow, and is mixed with white and lemon yellow.

Canary colour is also a pale yellow, but somewhat stronger and greener than buttercup colour, so if we add more lemon yellow to buttercup colour we get canary colour.

Carnation is a paled deep red made by adding white to carmine lake.

Cocoanut brown suggests burnt umber, and is mixed from white and burnt umber.

Colonial yellow suggests deep orange, and is mixed from white and deep orange.

Drab suggests burnt umber, and is mixed from white and burnt umber.

Flesh tint suggests orange, and is closely imitated by adding orange to white.

French grey suggests Indian red, and is white and Indian red.

Grass green suggests a light chrome green, and is mixed from yellow and chrome green or light green lake.

Heliotrope suggests purple, and is white and purple.

Ivory suggests pale yellow, and is white and Naples yellow.

Lavender suggests purple, and is white and purple. Purples are of either bluish or reddish cast. Comparing heliotrope and lavender, the latter is plainly bluer than heliotrope. So lavender is a tint of bluish heliotrope, a tint of reddish purple.

Lilac is also mixed from purple and white, as anyone can see.

Marigold suggests orange-yellow, and is white and orange-yellow

Corn colour suggests yellow, and is white and yellow.

Mauve suggests purple, and is purple and white.

Pea green suggests a dull green and is white and chrome green.

Pink suggests red and of course white and deep red yield pink.

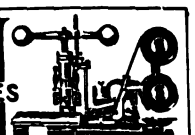
Terra cotta colour suggests sienna, and is white and burnt sienna.

Robin's egg blue suggests greenish blue and is white and milori blue.

Rose colour suggests deep red, and is white and deep red.

Sapphire colour suggests ultra blue, and is white and ultra blue.

Sky blue suggests a greenish blue, and is white and milori blue.



It must be remembered that if an opaque tint, or mixed colour containing white, is desired it will be necessary to use opaque white, generally known as cover white, as the base.

If the colour of the stock is to be covered, cover white is required. If the colour of the stock may show and have influence then mixing white will answer. By diluting cover white with gloss paste or gloss varnish, preferably gloss paste, we get a white similar ot mixing white, but drying out with a better lustre and finish.

For tints on rough-finish papers like the majority of cover papers, bonds, ledgers, parchment and the like, cover white is the best base, providing a transparent tint is not desired. For transparent tints mixing magnesia, laketine, mixing white and tint base are preferable to cover white. But all of these transparent and transluscent whites lack the body and covering quality of cover white, so do not give as good results on the rough-finish papers, but answer very well on coated stock.

When the soft, transparent whites print marled or mottled on coated paper they may be made to print clean and smooth by adding cover white.

PERHAPS the oldest, and almost certainly the richest and most powerful union of literary men, says the *Glasgow Herald*, is about to celebrate the conclusion of its 75th year. This is the French Société des Gens de Lettres, which was founded as long ago as 1837. Its inception was due to a forgotten journalist, Louis Desnoyers, who had for his colleagues Balzac, the elder Dumas, Thierry, Lamennais, and Victor Hugo. He also had the distinction of being the inventor of the feuilleton as practised in the French daily press, and as borrowed thence by our own.

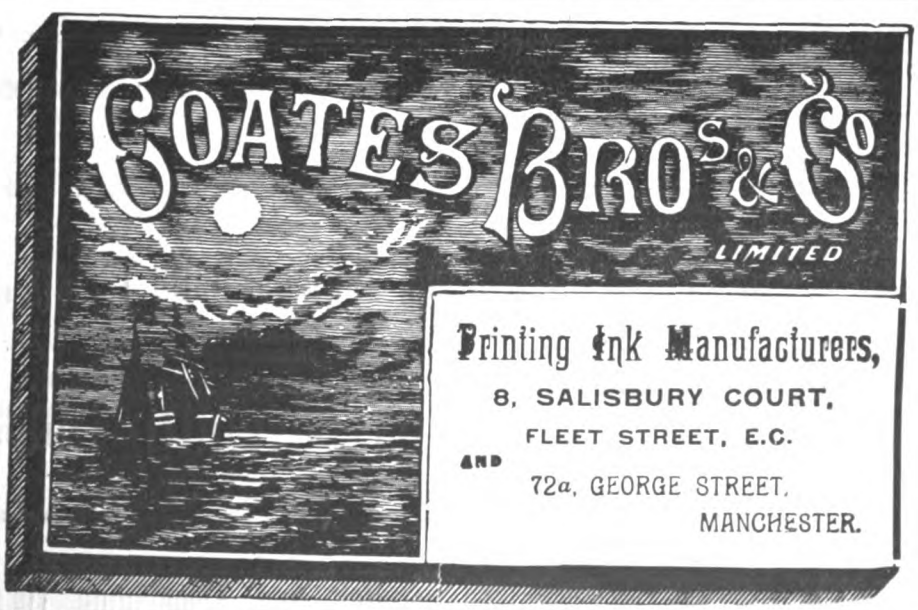
ONE WEEK'S OUTPUT OF STEREO METAL.

In AMERICA



There is published only one weekly paper representative of the interests of employing printers. It is the most popular Printers' Paper read, because:

It is the only strictly Business Paper.
The only Newspaper.
The only Paper which holds the attention of the man who owns the Plant.
The PRINTING TRADE NEWS does not attempt to teach printers to set type, but it is the foremost authority on the latest efficiency methods, the organization activities, progress in cost system work, approved methods of printers' advertising and anything and everything that tends to make the printing business a pleasant and profitable one.

We have good mechanics. Let us have good business men. Let the NEWS come to YOU every week. Europe **$5.00** per year; Canada **$3.00**. 64 Pages weekly.

Machines for Forming Cardboard Cylinders.

The accompanying drawings relate to machines for forming cardboard cylinders. The object of the patentee (Mr. E. C. Lovell, engineer, of Bristol) is to produce tubular cardboard bodies of square, oval or any other desired cross sectional outline.

Fig. 1 is a side elevation of a former; Fig. 2 a front end view thereof; Fig. 3 is a rear end view; Fig. 4 is a side elevation of an alternative form; and Fig. 5 is a side elevation showing the former, applied to an existing machine.

a indicates the body of the former which at the entrant end is preferably slightly flared or bell-mouthed as shown at a^1 to facilitate the entry of the card cylinder. The former at the entrant end is of circular cross sectional outline and such outline starting from the front end or at some other convenient point of its length gradually changes its cross sectional outline until at the exit end a^2 it corresponds to the cross sectional outline it is desired the cylinder shall present. The cylinder may first

Fig 1

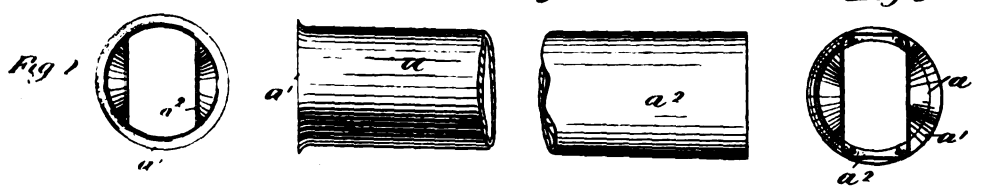

Fig 3

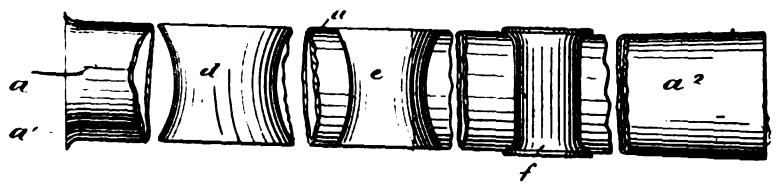
Fig 4



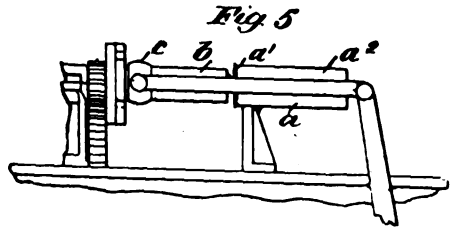


Fig 5

be discharged from the mandrel upon which it is made into a tubular receiver in which it remains until the succeeding cylinder pushes it out and into the former which is arranged in line with said receiver. In practice, it is found convenient to discharge the cylinder straight into the former. In Fig. 5 the former *a* is disposed at the end of the mandrel *b* so that as the body *c* is moved lengthwise upon the mandrel the cylinder is pushed off directly into the former *a*.

Rollers may be employed having suitably shaped peripheries to coact with the former. An arrangement such as that just referred to is shown in Fig. 4, where pairs of rollers such as *d e f* are provided mounted on suitable spindles, not shown, and arranged upon each side of the former, the body of which is cut away at these points to permit the rollers to come into contact with the exterior surface of the cylinder. Instead of only two such rollers four may be employed so that the whole or substantially the whole of the perimeter of the cylinder is acted upon. The rollers may be operated by contact with the cylinder or they may be positively driven. The former may be constructed in two parts hinged together, the parts being separated to permit the passage of the cylinder therein and then closed to compress same and give it the desired outline. Under these circumstances the

Why Must it Always be the Paper?

Professor Herzberg has lately published a number of instances in which the paper has been stigmatised as the cause of various troubles:—

(1) A paper mill received several complaints regarding the faulty sizing of its papers, and was quite unable to explain the cause. The complaints came exclusively from one locality, and this prompted the people at the mill to obtain some of the ink used there. When employing this ink it was proved that the latter spread into and penetrated all papers, even those well sized. Hence it follows that not the paper but the ink was at fault.

(2) Complaint was made by the receiver of a shipment of aluminium utensils in South America that on most of the objects whitish spots had formed, whereat the metal was corroded. At the test in the Material Testing Office it was determined that the paper contained neither chlorine, free acid, nor salts having an acid reaction. It was not possible to produce the spots when aluminium plates were kept in contact with the paper in a very damp atmosphere and at an increased temperature. The chemical analysis proved that the white powder adhering to the paper consisted chiefly of aluminium hydroxide. This indicated that the existence of the white spots and the corrosion were due to an action which has already very often been observed specially in tropical countries of great humidity, namely, decomposition of the aluminium. Here also the paper was first adjudged to be faulty.

(3) An unsized paper had been employed for wrapping bottles filled with scent. Various consignees complained that the paper emitted an objectionable smell. Investigation proved that the wrappers had been in contact with some offensive smelling liquid; had this explanation not been forthcoming, the paper again would certainly have been unjustly blamed.

Paper Towels and Napkins.

As the increasing demand for paper towels and napkins becomes more and more broadcast, American manufacturers, realising the success of this new field in the paper industry, are putting forth extra efforts to meet the needs of the consumers by adding new grades to their already large stock. Many of the restaurants have successfully adopted the use of these napkins, and towels are being utilised more than ever in schools, hotels and various public places as well as in private homes. Where sanitary conditions prevail the use of paper towels and napkins are found to be far superior to that of linen, and the cost is much less, as it does away entirely with laundry bills. The Continental Paper Bag Co. of New York, are now making a new towel made from clean spruce wood, absolutely free from all injurious chemicals, which is found to be sanitary, clean and absorbent, and should be used like a blotter. These towels are put up in rolls containing 150 extra heavy No. 1 grade. Nap-o-lin is the name of a new paper napkin which has just been put on the market by the company mentioned. It is specially recommended for its softness, and will undoubtedly meet with general approval and find ready sale.

A most interesting and beautifully got up booklet entitled "Historic Homes of the Linotype," has been issued by Messrs. Linotype and Machinery, Ltd., and deals with the historic associations of the buildings occupied by that firm at Altrincham, London, and Paris in a very complete manner. The history of the houses that have been formerly on the site of the London offices is given, together with illustrations of them taken from old prints, and it is interesting to find that the Paris offices of the company are situated in a building that once formed a portion of a palace belonging to Cardinal Richelieu, and that has had quite a varied assortment of tenants during its time. Polished floors, painted ceilings by good artists, and elaborate carving and gilding are now subordinated to the commercial demands of the twentieth century. The booklet has been compiled by Mr. Albert E. Pain, who has evidently found it to be a labour of love, and who has done his work well. Linotype users and printers all over the world should appreciate such an excellent brochure.

QUADS.

[We do not necessarily identify ourselves with any opinions of our contributor. At the same time, readers will not need to be assured that he always endeavours to communicate something worthy of attention.]

"I hold every man a debtor to his profession, from the which, as men do of course seek to receive countenance and profit, so ought they of duty to endeavour themselves by way of amends to be a help and an ornament thereunto."
FRANCIS BACON, Baron Verulam.

For what it is worth, I mention the Fleet-street report that an amalgamation of three large London printing firms is in contemplation. Or perhaps some intimate arrangement short of absolute joining up of interests.

o o o

There is always a jolly break-up concert at the end of the St. Bride Institute season. This year saw a new feature—a male choir of the Institute.

o o o

To explain how it came into being I should say that Mr. Percy H. Whiskin, one-time student and now Linotype Instructor of St. Bride, some time ago whisked in with the idea that there should be a St. Bride Old Students' Club. It was formed.

o o o

Following on that came the notion of a male choir. It was formed.

o o o

I think it consists entirely of members of the St. Bride Old Students' Club. The choir is youthful; and it has as yet had but a short career; with but few opportunities of practising. Thursday night saw its debut; and the success, despite the facts cited, was complete and most delightful.

o o o

"Comrades in Arms" was the first piece; and perhaps the most successful; but "Hail to the Chief" and "The Soldiers' Song" came hard on its track in the sense of favour won.

o o o

Encore to the St. Bride Male Choir. It has made a fine "attack"; may it go on and give us many and many a glee.

o o o

"Cupid Intervenes" was a very humorous dualogue by Mr. Randall and Mr. Marshall H. Collyer. "Carmen" was delightfully sung by Miss Winifred Grey; and Miss Winifred sang "The Enchantress"—and was one.

o o o

The male voice choir will meet again early in the autumn. Any other students of the Institute or other members of the craft who liked to join would be most heartily welcomed. They should communicate with Mr. Whiskin at the Institute.

o o o

Mr. F. W. Lewis, one of the Board of Governors of St. Bride, was in the chair at this break-up function. The Principal, Mr. J. R. Riddell, and the ex-Principal, Mr. A. J. Newton, were supporting him; and "with them," as law reporters say, Mr. E. R. Alexander, that doyen among technical instructors.

o o o

A very interesting link with the past has been severed by the death of that Peckham octogenarian, Mr. Joseph Calverley. For fifteen or more years he had retired from the responsibility of chief engineer of the *Times*. He had held that post for about thirty years. Previously he had been engaged in the engineering works of Sir Joseph Whitworth, of Manchester.

o o o

It was a great day in, I think, 1866, certainly just about that time, when the first Walter rotary press was completed and started its daily task of delivering the *Times*.

o o o

The evolving and elaboration, or should I rather say, the simplifying of this rotary press, had been Mr. Calverley's main engrossment. When he came to the *Times* in the early sixties to take charge of its engineering department he found the rotary stereo problem practically settled, though to be sure even in that particular the great journal had declined to take any risks. It had worked on rotary stereotyping for about four years before it relied upon those stereos absolutely.

o o o

Mr. B. Dellagana, one of the brothers Dellagana, makers of Swiss plaster images, was the brainy and enterprising man on whom the *Times* chiefly relied for this great departure. It assisted the brothers Dellagana in every possible way. It would appear that they were free of its establishment, and were permitted to conduct their experimenting in a specially set apart *Times* workshop and at the *Times*' expense. One of them founded the existing important firm of B. Dellagana and Co., of Shoe-lane.

o o o

The *Times* set up a workshop in Printing House-square for the construction of the Walter press.

o o o

I see the *Star* says of the first Walter press that it was generally admitted to constitute the greatest advance in the art of printing since the introduction of printing by steam.

o o o

Mr. E. Hunter, the head of Hunters, Ltd., the engineers and process engravers' suppliers of St. Bride-street, has won so much esteem and goodwill through a consistently high-minded conduct of his important business, that the news of heavy affliction falling upon him will ensure many a kindly thought. He has just lost his partner in life. She was as bright, hearty, happy a help-meet as ever a man had, by the testimony of those who had the privilege of her acquaintance.

o o o

I have heard that it was one more case of appendicitis suddenly laying low one in apparently the very prime and glow of health; and of a failure to rally after the operation.

o o o

I know Mr. Hunter very well; I would wish to acknowledge his friendliness and helpfulness; and the real value of his business example. This heavy loss following no little strain upon his own health through some months, will be indeed a very great calamity. One can but speak the word of courage; and tender at least the tribute due to the life that has closed.

FRANK COLEBROOK.

A Lecture on Colour Printing.

Mr. Courtney Lewis, the well-known writer of several books on the subject, lectured to the members of the Vesey Club, at the Masonic Hall, Sutton Coldneld, the other day, the subject of his lecture being the "History and Progress of Colour Printing," in which he traced the art both from wood blocks and metal plates from the earliest times to the present day. He showed how man had ever had a desire to represent in some semblance of their natural colours the animate and inanimate objects he saw around him, which was exemplified by the painting on the mummy cases by the Egyptians, on the vases by the Greeks and others, and by the mosaics by the Romans; how on the cessor of the papyri — which foreshadowed the coming of book illustration—all books were produced by hand, the text being written by the scribes on vellum, and the initial letters to the chapters being illuminated in gold and silver and beautiful colours by the illuminator; how the tendency always was to accentuate these initial letters, and that it was to these letters we owe the origin of colour printing. Then he went on to describe the state of Europe in the fifteenth century, how paper had come into use, and knowledge ceasing to be the monopoly of the few the demand for books increased, and so it came about that Gutenberg set up his printing press at Mainz, that as soon as a method of mechanically producing the work of the scribe was practicable, naturally a means was sought of producing in the same way the work of the illuminator, and then after the lapse of a few years, viz., in 1457 appeared the Psalter of Faust and Schaffer (who took over Gutenberg's press), which has its initial letters printed in colours. Then he spoke of the chiaro-scurists, who endeavoured in the sixteenth century to go a step further than the simple colours of their predecessors and put colour on colour to produce shading, their desire being to mechanically reproduce the studies made by Holbein, Titian, Raphael, Durer and other great artists of that age, for their pictures. Then Mr. Courtney went on to speak of the efforts made in England about the time of Hogarth to produce pictures for the first time by means of the press in their natural and proper colour, and of the two schools of printed pictures from metal plates and wood blocks, respectively founded by J. C. Le Blon and J. B. Jackson, from the former of which arose the grand works at the end of the eighteenth century in coloured mezzotint, aquatint and stipple of Alix Jannet, Debricourt and Descourt, in France, and of Ryland, Bartolozzi, the Wards, Val Green, J. R. Smith, Earlom and others, in England; the gradual decay and then the building up by George Baxter, in the nineteenth century, of a new school, and how he for the production of his beautiful prints united the two methods by a conjunction of wood blocks and metal plates, and for the first time in history took into the homes of the masses cheap artistic printed pictures in natural colours to their great advantage and refinement. It was also explained how interesting were his prints, not for these reasons only but because they were the "abstracts and brief chronicles of his time," almost every person and event of note being pictorially represented by him; but now this art was ultimately superseded by the cheap German chromo-lithograph. The extraordinary productions of William Blake were referred to, and the art of chromo-lithography with the Arundel chromos and the oleograph and the Japanese colour print were all explained, as well as the revival in the eighties of the nineteenth century of wood block printing, in the illustrations by Edward Evans, of the books of Kate Greenaway, Randolph Caldecott and Walter Crane.

In concluding a very exhaustive lecture, in which the subject was treated historically and not technically, and interspersed with several amusing anecdotes, the lecturer showed how in the present hustling age people would not read through columns of type when they could get the same impressions conveyed to their minds by a picture, and if by a picture how much more so by a coloured picture, and he expressed a belief as we already had an "all-picture" daily journal that we should wake up one morning to find coloured illustrations in our daily press.

The lecture was listened to throughout with marked attention.

MESSRS. SCHELTER AND GIESECKE, of Leipzig, have introduced a new script type under the name of "Watteau-Schrift." It is of a most artistic and delicate design, and is admirably adapted for fine display work, as is evidenced from the number of examples of jobs shown in the specimen book. It is made in the usual series of sizes from 10-point to 36-point, and with initials to match in larger bodies.

Machines for Forming Cardboard CYLINDERS.

The accompanying drawings relate to machines for forming cardboard cylinders. The object of the patentee (Mr. E. C. Lovell, engineer, of Bristol) is to produce tubular cardboard bodies of square, oval or any other desired cross sectional outline.

Fig. 1 is a side elevation of a former; Fig. 2 a front end view thereof; Fig. 3 is a rear end view; Fig. 4 is a side elevation of an alternative form; and Fig. 5 is a side elevation showing the former, applied to an existing machine.

a indicates the body of the former which at the entrant end is preferably slightly flared or bell-mouthed as shown at a^1 to facilitate the entry of the card cylinder. The former at the entrant end is of circular cross sectional outline and such outline starting from the front end or at some other convenient point of its length gradually changes its cross sectional outline until at the exit end a^2 it corresponds to the cross sectional outline it is desired the cylinder shall present. The cylinder may first

Fig 1

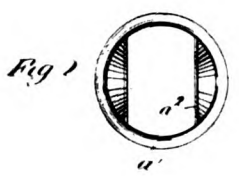

Fig 3

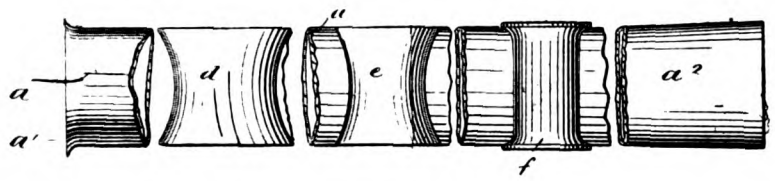
Fig 4



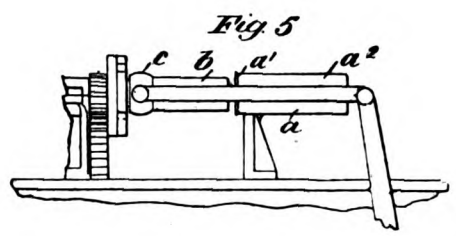


Fig 5

be discharged from the mandrel upon which it is made into a tubular receiver in which it remains until the succeeding cylinder pushes it out and into the former which is arranged in line with said receiver. In practice, it is found convenient to discharge the cylinder straight into the former. In Fig. 5 the former *a* is disposed at the end of the mandrel *b* so that as the body *c* is moved lengthwise upon the mandrel the cylinder is pushed off directly into the former *a*.

Rollers may be employed having suitably shaped peripheries to coact with the former. An arrangement such as that just referred to is shown in Fig. 4, where pairs of rollers such as *d e f* are provided mounted on suitable spindles, not shown, and arranged upon each side of the former, the body of which is cut away at these points to permit the rollers to come into contact with the exterior surface of the cylinder. Instead of only two such rollers four may be employed so that the whole or substantially the whole of the perimeter of the cylinder is acted upon. The rollers may be operated by contact with the cylinder or they may be positively driven. The former may be constructed in two parts hinged together, the parts being separated to permit the passage of the cylinder therein and then closed to compress same and give it the desired outline. Under these circumstances the shape of the former would be the same from end to end.

As the adhesive connecting the convolutions of the material forming the cylinder is not set or hard at the time of treatment, the said cylinder may be readily caused to assume any desired cross outline, and, the patentee claims, by means his invention, to readily impart to the cylinders any desired cross sectional outline without requiring the shape of the mandrel or any other detail of the main machine to be altered or interfered with. Obviously the former may be of any desired length so that the cylinders may be retained thereon for a longer or shorter period as may be found desirable to secure their proper formation.

Why Must it Always be the Paper?

Professor Herzberg has lately published a number of instances in which the paper has been stigmatised as the cause of various troubles:—

(1) A paper mill received several complaints regarding the faulty sizing of its papers, and was quite unable to explain the cause. The complaints came exclusively from one locality, and this prompted the people at the mill to obtain some of the ink used there. When employing this ink it was proved that the latter spread into and penetrated all papers, even those well sized. Hence it follows that not the paper but the ink was at fault.

(2) Complaint was made by the receiver of a shipment of aluminium utensils in South America that on most of the objects whitish spots had formed, whereat the metal was corroded. At the test in the Material Testing Office it was determined that the paper contained neither chlorine, free acid, nor salts having an acid reaction. It was not possible to produce the spots when aluminium plates were kept in contact with the paper in a very damp atmosphere and at an increased temperature. The chemical analysis proved that the white powder adhering to the paper consisted chiefly of aluminium hydroxide. This indicated that the existence of the white spots and the corrosion were due to an action which has already very often been observed specially in tropical countries of great humidity, namely, decomposition of the aluminium. Here also the paper was first adjudged to be faulty.

(3) An unsized paper had been employed for wrapping bottles filled with scent. Various consignees complained that the paper emitted an objectionable smell. Investigation proved that the wrappers had been in contact with some offensive smelling liquid; had this explanation not been forthcoming, the paper again would certainly have been unjustly blamed.

Paper Towels and Napkins.

As the increasing demand for paper towels and napkins becomes more and more broadcast, American manufacturers, realising the success of this new field in the paper industry, are putting forth extra efforts to meet the needs of the consumers by adding new grades to their already large stock. Many of the restaurants have successfully adopted the use of these napkins, and towels are being utilised more than ever in schools, hotels and various public places as well as in private homes. Where sanitary conditions prevail the use of paper towels and napkins are found to be far superior to that of linen, and the cost is much less, as it does away entirely with laundry bills. The Continental Paper Bag Co. of New York, are now making a new towel made from clean spruce wood, absolutely free from all injurious chemicals, which is found to be sanitary, clean and absorbent, and should be used like a blotter. These towels are put up in rolls containing 150 extra heavy No. 1 grade. Nap-o-lin is the name of a new paper napkin which has just been put on the market by the company mentioned. It is specially recommended for its softness, and will undoubtedly meet with general approval and find ready sale.

A most interesting and beautifully got up booklet entitled "Historic Homes of the Linotype," has been issued by Messrs. Linotype and Machinery, Ltd., and deals with the historic associations of the buildings occupied by that firm at Altrincham, London, and Paris in a very complete manner. The history of the houses that have been formerly on the site of the London offices is given, together with illustrations of them taken from old prints, and it is interesting to find that the Paris offices of the company are situated in a building that once formed a portion of a palace belonging to Cardinal Richelieu, and that has had quite a varied assortment of tenants during its time. Polished floors, painted ceilings by good artists, and elaborate carving and gilding are now subordinated to the commercial demands of the twentieth century. The booklet has been compiled by Mr. Albert E. Pain, who has evidently found it to be a labour of love, and who has done his work well. Linotype users and printers all over the world should appreciate such an excellent brochure.

QUADS.

[We do not necessarily identify ourselves with any opinions of our contributor. At the same time, readers will not need to be assured that he always endeavours to communicate something worthy of attention.]

"I hold every man a debtor to his profession, from the which, as men do of course seek to receive countenance and profit, so ought they of duty to endeavour themselves by way of amends to be a help and an ornament thereunto."
FRANCIS BACON, Baron Verulam.

For what it is worth, I mention the Fleet-street report that an amalgamation of three large London printing firms is in contemplation. Or perhaps some intimate arrangement short of absolute joining up of interests.

o o o

There is always a jolly break-up concert at the end of the St. Bride Institute season. This year saw a new feature—a male choir of the Institute.

o o o

To explain how it came into being I should say that Mr. Percy H. Whiskin, one-time student and now Linotype Instructor of St. Bride, some time ago whisked in with the idea that there should be a St. Bride Old Students' Club. It was formed.

o o o

Following on that came the notion of a male choir. It was formed.

o o o

I think it consists entirely of members of the St. Bride Old Students' Club. The choir is youthful; and it has as yet had but a short career; with but few opportunities of practising. Thursday night saw its debut; and the success, despite the facts cited, was complete and most delightful.

o o o

"Comrades in Arms" was the first piece; and perhaps the most successful; but "Hail to the Chief" and "The Soldiers' Song" came hard on its track in the sense of favour won.

o o o

Encore to the St. Bride Male Choir. It has made a fine "attack"; may it go on and give us many and many a glee.

o o o

"Cupid Intervenes" was a very humorous dualogue by Mr. Randall and Mr. Marshall H. Collyer. "Carmen" was delightfully sung by Miss Winifred Grey; and Miss Winifred sang "The Enchantress"—and was one.

o o o

The male voice choir will meet again early in the autumn. Any other students of the Institute or other members of the craft who liked to join would be most heartily welcomed. They should communicate with Mr. Whiskin at the Institute.

o o o

Mr. F. W. Lewis, one of the Board of Governors of St. Bride, was in the chair at this break-up function. The Principal, Mr. J. R. Riddell, and the ex-Principal, Mr. A. J. Newton, were supporting him; and "with them," as law reporters say, Mr. E. R. Alexander, that doyen among technical instructors.

o o o

A very interesting link with the past has been severed by the death of that Peckham octogenarian, Mr. Joseph Calverley. For fifteen or more years he had retired from the responsibility of chief engineer of the *Times*. He had held that post for about thirty years. Previously he had been engaged in the engineering works of Sir Joseph Whitworth, of Manchester.

o o o

It was a great day in, I think, 1866, certainly just about that time, when the first Walter rotary press was completed and started its daily task of delivering the *Times*.

o o o

The evolving and elaboration, or should I rather say, the simplifying of this rotary press, had been Mr. Calverley's main engrossment. When he came to the *Times* in the early sixties to take charge of its engineering department he found the rotary stereo problem practically settled, though to be sure even in that particular the great journal had declined to take any risks. It had worked on rotary stereotyping for about four years before it relied upon those stereos absolutely.

o o o

Mr. B. Dellagana, one of the brothers Dellagana, makers of Swiss plaster images, was the brainy and enterprising man on whom the *Times* chiefly relied for this great departure. It assisted the brothers Dellagana in every possible way. It would appear that they were free of its establishment, and were permitted to conduct their experimenting in a specially set apart *Times* workshop and at the *Times'* expense. One of them founded the existing important firm of B. Dellagana and Co., of Shoe-lane.

o o o

The *Times* set up a workshop in Printing House-square for the construction of the Walter press.

o o o

I see the *Star* says of the first Walter press that it was generally admitted to constitute the greatest advance in the art of printing since the introduction of printing by steam.

o o o

Mr. E. Hunter, the head of Hunters, Ltd., the engineers and process engravers' suppliers of St. Bride-street, has won so much esteem and goodwill through a consistently high-minded conduct of his important business, that the news of heavy affliction falling upon him will ensure many a kindly thought. He has just lost his partner in life. She was as bright, hearty, happy a help-meet as ever a man had, by the testimony of those who had the privilege of her acquaintance.

o o o

I have heard that it was one more case of appendicitis suddenly laying low one in apparently the very prime and glow of health; and of a failure to rally after the operation.

o o o

I know Mr. Hunter very well; I would wish to acknowledge his friendliness and helpfulness; and the real value of his business example. This heavy loss following no little strain upon his own health through some months, will be indeed a very great calamity. One can but speak the word of courage; and tender at least the tribute due to the life that has closed.

FRANK COLEBROOK.

A Lecture on Colour Printing.

Mr. Courtney Lewis, the well-known writer of several books on the subject, lectured to the members of the Vesey Club, at the Masonic Hall, Sutton Coldfield, the other day, the subject of his lecture being the "History and Progress of Colour Printing," in which he traced the art both from wood blocks and metal plates from the earliest times to the present day. He showed how man had ever had a desire to represent in some semblance of their natural colours the animate and inanimate objects he saw around him, which was exemplified by the painting on the mummy cases by the Egyptians, on the vases by the Greeks and others, and by the mosaics by the Romans; how on the cessor of the papyri — which foreshadowed the coming of book illustration—all books were produced by hand, the text being written by the scribes on vellum, and the initial letters to the chapters being illuminated in gold and silver and beautiful colours by the illuminator; how the tendency always was to accentuate these initial letters, and that it was to these letters we owe the origin of colour printing. Then he went on to describe the state of Europe in the fifteenth century, how paper had come into use, and knowledge ceasing to be the monopoly of the few the demand for books increased, and so it came about that Gutenberg set up his printing press at Mainz, that as soon as a method of mechanically producing the work of the scribe was practicable, naturally a means was sought of producing in the same way the work of the illuminator, and then after the lapse of a few years, viz., in 1457 appeared the Psalter of Faust and Schaffer (who took over Gutenberg's press), which has its initial letters printed in colours. Then he spoke of the chiaro-scurists, who endeavoured in the sixteenth century to go a step further than the simple colours of their predecessors and put colour on colour to produce shading, their desire being to mechanically reproduce the studies made by Holbein, Titian, Raphael, Durer and other great artists of that age, for their pictures. Then Mr. Courtney went on to speak of the efforts made in England about the time of Hogarth to produce pictures for the first time by means of the press in their natural and proper colour, and of the two schools of printed pictures from metal plates and wood blocks, respectively founded by J. C. Le Blon and J. B. Jackson, from the former of which arose the grand works at the end of the eighteenth century in coloured mezzotint, aquatint and stipple of Alix Jannet, Debricourt and Descourt, in France, and of Ryland, Bartolozzi, the Wards, Val Green, J. R. Smith, Earlom and others, in England; the gradual decay and then the building up by George Baxter, in the nineteenth century, of a new school, and how he for the production of his beautiful prints united the two methods by a conjunction of wood blocks and metal plates, and for the first time in history took into the homes of the masses cheap artistic printed pictures in natural colours to their great advantage and refinement. It was also explained how interesting were his prints, not for these reasons only but because they were the "abstracts and brief chronicles of his time," almost every person and event of note being pictorially represented by him; but now this art was ultimately superseded by the cheap German chromo-lithograph. The extraordinary productions of William Blake were referred to, and the art of chromo-lithography with the Arundel chromos and the oleograph and the Japanese colour print were all explained, as well as the revival in the eighties of the nineteenth century of wood block printing, in the illustrations by Edward Evans, of the books of Kate Greenaway, Randolph Caldecott and Walter Crane.

In concluding a very exhaustive lecture, in which the subject was treated historically and not technically, and interspersed with several amusing anecdotes, the lecturer showed how in the present hustling age people would not read through columns of type when they could get the same impressions conveyed to their minds by a picture, and if by a picture how much more so by a coloured picture, and he expressed a belief as we already had an "all-picture" daily journal that we should wake up one morning to find coloured illustrations in our daily press.

The lecture was listened to throughout with marked attention.

MESSRS. SCHELTER AND GIESECKE, of Leipzig, have introduced a new script type under the name of "Watteau-Schrift." It is of a most artistic and delicate design, and is admirably adapted for fine display work, as is evidenced from the number of examples of jobs shown in the specimen book. It is made in the usual series of sizes from 10-point to 36-point, and with initials to match in larger bodies.

Trade Notes.

WE understand that Mr. Garrish, sub-editor of the *Globe*, has resigned after twenty-five years' service.

THE late Mr. E. S. Gibbons, founder and chairman of Messrs. Stanley Gibbons, postage stamp dealers, has left estate of the value of £13,560.

THE Montreal Printers' Board of Trade have removed their offices to the new Gillette Building, 71–73, St. Alexander-street, Montreal, Canada.

ON Saturday night the premises of the *North Bucks Times*, Aylesbury-street, Fenny Stratford, were destroyed by fire, which apparently started in the engine-room.

THE liquidator of the London Evening Newspaper Co., Ltd. (*Evening Times*), announces that a first and final dividend of 3s. 5½d. in the pound has been declared and is now payable.

AT a meeting of the Yorkshire district of the Institute of Journalists at Leeds, on Saturday night, it was unanimously decided to confirm the invitation to the Institute to hold the next Conference at York in the autumn.

MR. R. D. BLUMENFELD has forwarded to the Lloyd Memorial (Caxton) Seaside Home, Deal, a cheque for £115 on behalf of the proprietors of the *Daily Express* and their staff, for the purpose of endowing a bed in the name of that paper at that institution.

AFTER a connection of thirty years with the well-known firm of Messrs. Mawson, Swan, and Morgan, Ltd., Newcastle-on-Tyne, Mr. James Harrison is leaving that city to take up the position of managing director of Messrs. W. Lockwood and Co., New Bond-street, London.

THE body of Mr. Wm. Dixon Galpin has been found in the forest above Lausanne. He was last seen in February, and a reward of £40 was offered for information. The deceased gentleman was a member of the well-known family of Galpin, which once filled such a large place in the publishing world in conjunction with the late John Cassell.

TRADE BOARDS ACT.—On Thursday last, at Old-street, before Mr. Chester Jones, Philip Sollash, cardboard boxmaker, of Hackney-road, answered summonses under the Trade Boards Act, 1909, for neglecting to pay a female employee the minimum rate of wages as ordered by the Board. After a hearing, Mr. Chester Jones intimated that in future he would impose the full penalty of £20 and £5 a day during the period of the offence, but in the circumstances he sentenced the defendant to pay a fine of £3 3s. and £5 5s. costs on the first summons, or alternatively to undergo a month's imprisonment. The case was stated to be the first of the kind heard in London.

THE picture of the Royal Group by John Lavery, A.R.A., at Burlington House, is, by command of their Majesties, to be entitled in the Royal Academy catalogue, "The King, the Queen, the Prince of Wales, and Princess Mary, Buckingham Palace, 1913." Their Majesties have permitted Mr. Hugh Spottiswoode to commission Mr. Lavery to paint a group with a view of the painting being presented to the nation. The trustees of the National Portrait Gallery have, through their director, Mr. C. J. Holmes, expressed their pleasure in accepting the picture, and have conveyed their special thanks for the gift. The picture will be engraved in colour, and published by Messrs. Thomas Agnew and Sons.

TENDERS WANTED.—By the Corporation of Westminster for printing of the lists and registers of electors for the several parishes, electoral divisions, etc., in the city of Westminster, and jury lists for the several parishes. Schedules from the Town Clerk, Westminster City Hall, Charing-cross-road, W.C. By the Huddersfield Education Committee for school books, school exercise books, school prizes, drawing materials, office printing, books, and stationery. Particulars from Mr. O. Balmforth, Education Offices, Peel-street, Huddersfield. By the Wakefield Corporation for printing lists of voters, parliamentary register, burgess roll, etc. Forms of tender from the Town Clerk's Office, Wakefield. By the Kingston-on-Thames Corporation for the supply for year ending June 30th, 1914, of stationery and printing. Forms of tender can be obtained at the Town Clerk's Office. For printing for the Darlington Dog Show. Particulars from Mr. W. Parlour, 6, Ardenstreet, Darlington.

THE Newcastle and District Printers Managers and Overseers' Association was inaugurated in that city on Saturday last. The chairman (Mr. A. J. Platt, of Messrs. Mawson, Swan, and Morgan's), in his opening remarks, pointed out the good which would accrue—in the exchange of ideas, etc., connected with the management of printing businesses—to the members of the association. Representatives from several of the large firms in the city took part in a discussion which followed. The meetings of the association were fixed for the first Monday of each month. On June 2nd. Mr. A. J. Platt will give a paper on "How a costing system affects overseers."

ACCORDING to *Kemp's Mercantile Gazette* there were no failures in the printing and stationery trades of England and Wales for the week ending Friday, May 2nd; the corresponding week in 1912 showed four.

TENDERS ACCEPTED.—For printing 1,500 copies of a general catalogue of books in the West Derby Branch Library, for the Corporation; Lyceum Press, 37, Hanover-street, Liverpool. For the Bridlington Corporation, Petty and Sons (Leeds), Ltd., printing 3,000 copies of a 16-sheet poster; T. Illingworth and Co., London, mounting 51 sets each of two photographs 6-ft. by 2-ft.

A CAPITAL little manual of photographic practice is issued by the Wallsgrove Press, Bletchley, under the title of "Photo-Prelims," and at the small cost of twopence. Primarily intended for the beginner, it deals with the various manipulations of photography in a clear and concise manner, and is a wonderful example of value for money. Its use is rendered easy by a cut index, so that any point on which the novice is doubtful can at once be turned up.

THE first number of *Coming Fashions*, a monthly journal, published by the *Daily Chronicle*, at threepence, marks a new and interesting departure in the history of those papers which are devoted entirely to the subject of feminine attire. Enclosed in a very attractive cover, printed in gold and colours, the new journal contains a hundred and fifty sketches, drawn specially in Paris. The front cover is in colours, and the whole get-up of the paper is excellent.

ON Monday, at York, David Lewis Jones, 35, Pockington-terrace, York, was summoned for committing an offence against the Newspapers, Printers and Reading-rooms Repeal Act, 1869, by printing in March last certain papers which did not bear the name of the printer. The prosecution related to the printing of football betting coupons. The bench decided that as this was the first case of the kind which had come before them, they would only impose a penalty of £1, with costs.

FIRE.—The printing works of Messrs. Hayes, Reynolds and Co., at Letchworth, were totally destroyed by fire last week, the damage being estimated at over £40,000. The buildings were of light construction, and were very quickly gutted. An unfortunate result of the fire will be that about 300 workers will be thrown idle. Although calico printers, the firm's methods were on a lithographic basis, and were interesting as showing a departure from the usual practice in textile printing, as instead of getting the impression from engraved copper rollers, as is the usual practice, the designs were obtained upon zinc cylinders and printed directly without the necessity for etching or engraving. The design in this method is prepared in a greasy ink, and printed while the roller is wet, in special colours, remarkable for their permanence to light and washing tests. The nature of the method is such that no after operations are usually required to complete the work, and the machines used are quite out of the usual construction for textile printing, and capable of running at high speeds.

AT the close of the hearing at Bow-street, on Monday, of the case against the arrested members of the W.S.P.U. before Mr. Curtis Bennett, Mr. Bodkin proceeded against Mr. Drew, who printed the *Suffragette* on May 2nd. Mr. Drew was now willing to give an undertaking to the effect that he would not, directly or indirectly, take part in printing or publishing the *Suffragette* or other organ of the W.S.P.U., or in printing or publishing any matter inciting to crime. I shall very distinctly draw attention to the fact, said counsel, that a paper called the *Daily Herald* is also printed by the Victoria House Printing Co., Ltd., and this undertaking is intended to cover Mr. Drew, so far as being any party in the publication of the *Daily Herald* is concerned, so long as that paper continues to deal with this question of the suffragettes and the W.S.P.U. in the way of advocating it or of supporting it. In binding Drew over in his recognizances of £1,000 and two sureties of £500 each, the magistrate said the defendant was greatly indebted to the prosecution for the course they had taken. Mr. Bodkin: This course the prosecution will certainly not take in regard to any other acts after to-day.

OUR American contemporary, the *Publishers' Weekly*, has removed to 141, East Twenty-fifth-street, New York. The movement is made in association with the printing house of the Andrew H. Kellogg Co., which will thereafter print the *Publishers' Weekly*, and the two concerns will occupy an entire floor of the huge building, which extends from Twenty-fifth to Twenty-sixth-street, and has a frontage of nearly 200 feet on each street.

Sociability at St. Bride Institute.

For those who are interested in the St. Bride Printing Classes a pleasant entertainment was organised by the Students' Social and Athletic Club on Thursday, May 1st, to wind up the Session. The club has been formed with the object of fostering sociability and good fellowship among the technical students and to encourage them to maintain their connection with the Institute after passing through the classes.

The inception of the club came about in a peculiar way. The Linotype instructor, Mr. P. H. Whiskin, noticed that a state of "freezing chilliness" pervaded the classes throughout the session, which ended with the same estrangement between them as at the beginning. On two occasions an endeavour was made to promote a social gathering as the best means of "breaking the ice," with immature results. However, the third attempt was more successful, and the conversazione of May 11th, 1912, was the culminating point of an invitation from the instructor to Linotype students who were interested in music to meet in the Institute one evening to talk over the subject. A piano was in the room, and one student ventured a tune. This encouraged another linotype student to "rattle off" some popular airs. The next attempt was a duet by these students, who had never before spoken to each other, although in the same class (a state that had become too characteristic of the classes), and thus it showed that they were well acquainted with the piano keyboard, an affinity which, after all, seems natural.

A concert held at the commencement of the Session just closed was the means of introducing a scheme, which had met with the approval of the Governors, as previously stated, and to set the club on foot. The social gathering of May 1st has now placed this scheme on a good foundation. The Chairman of the Governors should have presided, but at the last moment he decided not to come owing to an unfortunate attack of rheumatism, and in his place the chair was occupied by Mr. F. W. Lewis, a member of the Printing Committee, supported by Mr. E. R. Alexander and Mr. A. J. Newton (also members of the Printing School Committee), Mr. J. R. Riddell, Principal of the Institute, and the instructors of the classes. The concert was also honoured by the presence of Mr. J. C. Grant, inventor of the Grant-type machine, Mr. L. A. Legros, co-partner in the firm of Grant, Legros and Co., also Mr. G. P. Barnes, of the *Times* office, and Messrs. F. Fountain and J. E. Moorhouse, of John Dicks Press, and others, with a good proportion of ladies gracing the proceedings; so that the governing body, instructors, employers, and students mingled together for a brief space for an opportunity of leave-taking at the break-up of the Session, for which this concert was especially organised. The proceedings commenced with an exhibition of students' work, for which the schools were thrown open, and the work displayed just as the students had left it, with working demonstrations given. A very important section of the exhibition was the display of Mr. Peddie, the technical librarian, of specimens of old German printing. During this period refreshments were dispensed by Mrs. Ryan, who, with her usual and well-known abilities, was able to tickle the palates of the visitors with dainty dishes and so helped to put everybody in a jolly mood. While only two of the contributors disappointed the audience, the other items were charmingly rendered, and were warmly appreciated.

Borough Polytechnic Institute.

Presentation to the Chief-Instructor of Typographical Classes.

Since the inauguration of the typographical section at the Borough Polytechnic Institute, S.E., the success of the classes and the technical knowledge imparted to the students attending them, is largely attributable to Mr. Wm. H. Slater, the chief instructor, and in recognition of his 21 years' valuable services his past and present pupils, together with a large number of friends and admirers, presented him on Tuesday evening with an illuminated address—a real work of art—a black marble time-piece and ornaments. The function was graced by the presence of many men in the printing trade, literary and otherwise, and great enthusiasm prevailed.

Mr. Arthur Powell, K.C. (*Printers' Register*), who presided, in opening the proceedings, paid an eloquent and impressive tribute to the services rendered the printing trade by Mr. Slater. They were met that evening, he said, to perform a very pleasant task. They were to do honour to one, who, although he had not been the inventor of new machinery, or, new processes, was nevertheless in his own sphere a pioneer and had done a good deal for the advancement of typography. (Applause.) Printing was a subject that must be dealt with from various points of view. It was a great industry, and yet he supposed if anyone were asked to name the great industries of the country, they would hardly commence with that of printing. It had not appropriated to itself almost the whole of a shire as the cotton industry had done, nor had it caused large towns to spring up like the woollen industry; but, notwithstanding, printing was a great industry and although not to be found located in one or two or more places in a certain section of our land, there was hardly a small town where there was not at least one printing office, whilst in the large towns, as they all knew, there were many offices and most of them of great importance. The printing trade was a craft, and a craft that required to be learnt and learnt thoroughly, and although it did not rank with the great arts of literature and painting and sculpture, nevertheless in many of the branches of printing an art had been achieved and sometimes a fine art had actually been attained. Therefore, he would say that printing stands upon an eminent pedestal, because it was not only an industry, but a great craft and art. Having dealt with the apprentice question, Mr. Powell traced the history of the printing classes in the Borough Polytechnic, and mentioned that they were started with a plant valued at about £20, whereas to-day the value reached £1,000. Year by year the classes had improved and increased until there were now 260 students, and the progress was entirely due to the work of William Henry Slater, who had been a teacher of typography in the Institute for the full period of 21 years, and it was to mark their sense of gratitude on his merits as a teacher—and because he had been in the Institute so long—that his pupils, past and present, had joined together to tell him in a tangible way that they were fully convinced that he had done good work. They were making him a presentation—(applause)—and personally he was pleased to be there that evening to be able to participate in that function. (Applause.)

Mr. Jas. Dyer and Mr. George Joyner also delivered short speeches eulogising the work of Mr. Slater and mentioned that the classes had made great progress under his guidance.

The Chairman next made the presentation, and addressing Mr. Slater said: "Mr. Slater, it is my pleasant duty to be the mouthpiece of this meeting and to ask you to accept the illuminated testimonial which is there before me and the clock which is before you as a token of the regard in which you are held by all those associated with you, and by your past and present pupils and by your friends. That testimonial is one which must be of much gratification to you. It is a thing of beauty; it is an admirable specimen of the work of the pen and the brush, and will always remind you of the time you have given to the Borough Polytechnic. You have thoroughly deserved such a testimonial and I am glad to be present here this evening and to endorse all that has been said about you, and I now ask you to accept that unique testimonial and clock as tokens of regard." (Applause.)

Mr. W. H. Slater.

The testimonial presented to Mr. Slater was in the form of an illuminated address of an elaborate and artistic character, the wording occupying the centre, surrounded by a decorative border. In an oval panel at the top is the portrait of Mr. Slater, while in smaller panels at the sides appear the portraits of the committee responsible for the carrying through of the presentation. The address is enclosed in a handsome gold frame, and is a remarkably fine example of illuminated work. In addition to the address Mr. Slater was also presented with a fine marble clock decorated with bronze figures.

Mr. Slater, who was loudly applauded, said he felt like adopting the words of the good old saying, "the least said, the soonest mended." They had heard many kind and generous things said about him, and he was quite unaware of having done anything unusual to merit even private recognition, let alone a great public testimonial in the form of a presentation like that which had just been handed to him. He was deeply grateful to all his friends and students, and he must say that a great share of the success of the work was also attributable to the teachers, who were his colleagues in the classes. They all worked loyally and energetically.

Mr. F. C. Shepard, who acted as joint. hon. secretary, along with Mr. C. A. Edwards, also spoke of Mr. Slater's worth, and on the motion of Mr. Coote (one of the governing directors of the Institute), seconded by Mr. C. Millis (Principal of the Institute), a hearty vote of thanks was accorded Mr. Powell for presiding. Mr. Millis, in his address, referred to the valuable help employers and the trade organisations had been to the Institute in the conducting of the printing classes, and no better teacher, he observed, could have been obtained than his colleague, Mr. Slater. (Applause.)

Mr. Powell having acknowledged the vote of thanks, the proceedings ended.

Credit must be given to Mr. Shepard for the way the arrangements and work connected with the presentation were carried out.

Special Prepaid Advertisements.

IT IS IMPORTANT that Advertisements under any of the Headings mentioned below should reach us by the first post on Wednesday to insure insertion the following day.

SITUATIONS.—Charges for Advertisements under the headings "Situations Vacant," or "Situations Wanted," are at the rate of

ONE SHILLING FOR 24 WORDS
(3 Insertions: TWO SHILLINGS),

and Fourpence for each additional Eight Words. Minimum Charge, One Shilling.

BUSINESSES FOR SALE or WANTED, MACHINERY WANTED or FOR SALE, SALES BY AUCTION, TENDERS, PUBLIC APPOINTMENTS, MISCELLANEOUS—One Penny per Word.

PAYMENTS must be made in advance, except where the Advertiser has a running account, in which case the cost can be debited thereto.

STONHILL & GILLIS, 58, Shoe Lane, London, E.C

Situations Vacant.

TRAVELLER, calling on Manufacturers and Merchants, can have Agency for Patent Never-Lost Tallies as recommended and approved by Railway Companies; commission only.—James, 32, Thynne-street, West Bromwich. 13204

Situations Wanted.

A PRINTER, thorough practical knowledge of high-class General Printing and Three-Colour Work, seeks berth as REPRESENTATIVE or ASSISTANT WORKS MANAGER; first-class references.—Address, C. G., No. 13197, Office of the BRITISH AND COLONIAL PRINTER AND STATIONER, 58, Shoe-lane, London, E.C. 13197

PRINTING INK MAKER, thoroughly experienced and up-to-date, desires position in London; moderate salary.—Address, No. 13207, Office of the BRITISH AND COLONIAL PRINTER AND STATIONER, 58, Shoe-lane, London, E.C. 13207

WORKING FOREMAN (Compositor) seeks berth; used to high-class jobbing work; 17 years' experience; abstainer; references.—Address, No. 13201, Office of the BRITISH AND COLONIAL PRINTER AND STATIONER, 58, Shoe-lane, London, E.C. 13201

Machinery and Plant for Sale.

ALL ELECTROTYPERS and STEREOTYPERS should write H. Williams and Co. for their latest catalogue of machinery, and Electroline Enamel Paste, for producing fine art stereos.—Engineers, Red Lion Works, Warner-street, Rosebery-avenue, E.C. 12343

MONOTYPE "D" KEYBOARD for Sale; as good as new; satisfactory reasons for disposing of same.—Address, No. 13205, Office of the BRITISH AND COLONIAL PRINTER AND STATIONER, 58, Shoe-lane, London, E.C. 13205

Miscellaneous.

FIRST-CLASS FIRMS wanted in all parts of the world, having good connections with the Printing Trade, to introduce new and most successful Automatic Feeder and other Machines.—Address, "Zetetic," No. 13206, Office of the BRITISH AND COLONIAL PRINTER AND STATIONER, 58, Shoe-lane, London, E.C. 13206

TO PRINTERS, PUBLISHERS and ALLIED TRADES.—TO BE LET, as a whole or in Sections, an important Block of Buildings covering an Island Site conveniently situated close to Fleet Street. They contain four well-lighted upper rooms with lofty basement. Total floor space, 12,625 sq. ft.—Rent and further particulars of Messrs. Farebrother, Ellis and Co., 29, Fleet-street, E.C. 13181

HIGH-SPEED
Rotary Photogravure.

ADVERTISER (German, 36), who has a thorough knowledge of Processes, Machinery, Apparatus, Materials, etc., in connection with the above, desires position with a leading British Machine Manufactory, or company exploiting this industry, in which he can utilise to advantage an experience of some years with a well-known South German firm; acquainted with English, German, French and Spanish; good correspondent; has been connected with Banking and Consular business in Europe and America; travelled extensively; is energetic and practical, with good commercial ability; first-class testimonials; at liberty July 1st.—Address, in first instance, No. 14,054, Office of the BRITISH AND COLONIAL PRINTER AND STATIONER, 58, Shoe-lane, London, E.C. 14054

"Suppressing" Newspapers.

Mr. BODKIN, at Bow-street Police Court, last week, made rather an unusual statement regarding a newspaper which he said must be suppressed, or "put a stop to." Certainly we have no comment to offer on any publication or on anyone who publishes seditious statements or circulates invitations to incite people to damage property or to engage in such unlawful acts, whether they may be political or otherwise. What we are concerned with is the threat made by Mr. Bodkin to suppress a newspaper, and we are at a loss to learn where he gets his law from, as we do not know of any power by which a paper can be suppressed or "put a stop to" as regards its future numbers. We have all heard of the printed circulation of a paper being suppressed on the day of issue, but to condemn the newspaper and its future appears like new doctrine. Take a newspaper that may appear in a week's time—who is to prove that it will contain any statements likely to bring it within the powers of a court? Who is to read the mind of the editor responsible for it, and give that "reading" as evidence? The problem is one that cannot easily be solved either by the law of evidence, not to speak of the law of suppression.

* * *

Does Economy Always Pay?

THERE are two kinds of economies, the economy that saves money, and the economy that does not, and the latter is responsible for a lot of loss in the printing office that is conducted on too cheeseparing lines. An American manager gives a number of instances of false economies that have recently come under his notice, and instances a printing office where the manager thought that there was too much idleness in the power department, the assistant engineer and the two firemen were given work to consume their supposed idle time. The packing up of finished printing for shipment to patrons, the painting of departments when needed and the overhauling of presses were among the extra duties imposed upon them. Formerly they had devoted their extra time to overhauling the valves and pipes of the power and heating system, thereby keeping the engine and boiler in good order. The neglect of the power and heating systems resulted in complaints and delays. Finally, after an investigation, the superintendent directed that the engine-room force be relieved from the extra work imposed upon the men, so that the men could devote their time and attention to the entirely power system. In another office the foreman thought he could make a hit with the manager by putting a boy to work scraping the ink from the bottoms of the cans which heretofore were thrown upon the waste pile. The ink thus saved proved to be quite a little item in the course of the month. The ink saved for the printing office was put up in the cans with the original lots. The manager praised the foreman until it was discovered that the ink thus saved had certain detrimental aspects. The printing was not quite so good as before. The ink made a blurry condition in spite of the effort of the pressmen to overcome the trouble. It was then found that the boy, in order to make a good impression, did not hesitate to scrape up a little foreign matter and add the same to the ink now and then; such, for instance, as grease from the boxes of the shafting, which had gummed and become black, but the idea of the foreman to save money by utilising the apparent wasteage of ink in the old tins was stopped. Another energetic overseer in a printing plant decided that he could save money by having the elevator boy do some side work while not running the elevator. The wise foreman had the boy away from the elevator during his waiting time. To the boss this seemed to be all clear gain and he called the attention of the proprietor to the fact, who for a time thought that he had a good and careful boss in the thoughtful foreman. One day someone was in a hurry to run up some goods on the elevator and not seeing the boy there, undertook to operate the car. A liberal sized order of newly bound books, from the department of binding, was dumped from the upper floors through the elevator shaft to the base of the building by the clumsy work of the inexperienced party. The loss resulting from this accident cost the firm more than the elevator boy's pay for a long time, he was ordered to return to the elevator and not do any more side work. Other futile economies might also be mentioned, such as using cheaper lubricating oils, with damage to the machinery and consequent cost of repairs; paying off a good hand and getting a cheaper man in his place, with the result of poorer work and less of it. But the average printer will be able to think of many instances in which his economy has proved to be anything but remunerative.

* * *

Paper Prices.

WITH a slackening in the demand for news and printings, papermakers have felt that it is very difficult to force prices in an upward direction. The printing trade throughout the country is by no means so active as it was a few months ago, and orders for paper not being so freely placed, there is more competition for the business that is going. The disposition, unfortunately, is to increase discounts, and prices practically show no improvement on those current a year ago. With sulphite continually going up in value, and all other materials—with the exception of mechanical—more costly, the papermaker finds it very difficult to maintain his dividend-earning powers, especially with more expensive labour and reduction in working hours. Probably at the forthcoming meeting of the Papermakers' Association trade condi-

Digitized by Google

tions will be fully discussed. Speaking generally, the official recommendation to secure a 10 per cent. increase on printings and fine paper has apparently been futile

Scottish Trade Union Congress.

The annual congress of the Scottish Trades Unions was opened last week, at Dumfries. Mr. R. Turner presiding over about 150 delegates, the largest number that has as yet taken part in these proceedings, representing over 300,000 workers. A hearty welcome to Dumfries was given to the members by two of the local town councillors. At the opening of the sitting, Mr. Robert Allan (Edinburgh) called attention to the presence of a reporter from the office of the *Dumfries Herald*, and pointed out that the printers of that firm had been out on strike for eleven weeks in an endeavour to enforce the trade union rule regulating the number of apprentices. The proprietors of that paper declined to observe trade union conditions, and he thought their reporter should be excluded from the sittings of the Congress. Mr. Hugh Lyon, Glasgow, seconded, and the motion was unanimously adopted, the reporter referred to being then asked to retire.

The reporter stated that he was also representing the Press Association, and a delegate said that in that case his exclusion would rob half the newspapers in the kingdom of their reports.

In the course of his address, the Chairman referred to the National Insurance Act and said their Parliamentary Committee made representations with a view to having certain amendments made where they considered that the Act bore heavily on the workers. With reference to Clause 11, dealing with sick pay during the time a workman was laid aside as the result of an accident, they contended that at such a time the worker should be entitled to draw sick benefit as well as compensation. In regard to contributions during periods of unemployment, it seemed a strange form of political sagacity which called upon a worker to pay 4d. a week for health insurance while employed, while during the time the same person was unemployed 7d. was required. He spoke of the labour unrest during the past two years, and the upheaval caused by strikes that had taken place. They admitted that industrial warfare was disastrous, but at the same time social evils must be eradicated, and in spite of the sufferings which strikes entailed, they were absolutely necessary. Although trade was excellent at the present moment, and huge profits were being made, the workers had to threaten industrial war because the price of their labour was but a bare subsistence. They abhorred war of all kinds, but if justice could only be got by force then force must be employed. For that reason the labour forces of the country should utilise the benefit of the present boom in trade for perfecting their organisations.

IF THE MIEHLE WAS NOT SOMETHING MORE THAN A TWO-REVOLUTION PRESS IT WOULD NEVER HAVE REACHED THE PROUD POSITION IT HOLDS TO-DAY IN THE ESTIMATION OF EVERY PRACTICAL PRINTER

It is because it is *the* two-revolution press that the trade buys it.

Design, material, workmanship- all combine to make and keep it the premier machine.

It is built at the Broadheath Works—in itself a guarantee of efficiency.

Financial.

Offices of the *British and Colonial Printer and Stationer*,

58, SHOE LANE, LONDON, E.C.

WEDNESDAY, May 7th, 1913.

THE shortage of credit and the keen demand for it continued to the end of last month, since when the market has been easier, though the margin is still narrow. Influenced by the improved political outlook discounts are easier. Bullion movements have resulted in a net influx for the week of £814,000 to date. After the usual May-day holiday, Stock markets opened last Thursday in a more hopeful mood, and the tone has been moderately firm since, but public business has not greatly increased. There has been an encouraging revival in Consols, quotations now being 75 1/16 to 75 3/16 for money, and 75 3/16 to 75 5/16 for the account.

A fairly firm tone has been maintained in the miscellaneous industrial market during the last few days, but business remains inactive. In the section relating to paper and print there have been a few small movements, the majority being on the weaker side. International Linotype have risen a further point, to 81—86, while Linotype and Machinery A Deb. have dropped 1 to 57—62; *Standard* Newspapers have fallen ¾ to 1½—2½, and Raphael Tuck and Sons Pref. are down 1/16 to 4 13/16—5 1/16. Business has been done during the past week in Amalgamated Press Pref. at 21s. 6d.xd.; in Ilford Ord. at 14s. 3d., 13s. 6d. and 14s., and in the Pref. at 18s. 3d.xd.; in International Linotype at 86, 84¼ and 84; in Linotype and Machinery A Deb. at 59½; in Edward Lloyd Pref. at 22s. 6d., 21s. 10½d. and 22s. 3d.; in George Newnes Pref. at 15s.; in Spicer Bros. Pref. at 9⅜ and 9⅝; in Raphael Tuck and Sons Ord. at 18s. and 18s., and in the Pref. at 99s. 4½d.; in Waterlow and Sons Def. Ord. at 25⅞, and in the non-cum. Pref. at 12⅛; in Waterlow Bros. and Layton Ord. at 5⅜; and in Weldons Pref. at 20s. 3d.

DIVIDENDS AND REPORTS.

"JOHN BULL."—The report says the directors propose at once to pay the arrears of preference dividend down to the end of 1911—that is to say, for nine months. This will absorb £3,032. They hope at an early date to make a further distribution in respect of the preference shares for the year 1912, and they will be disappointed if at the close of the year they are not in a position to declare a dividend upon the ordinary shares.

PRESS ASSOCIATION, LTD.—The forty-fifth annual meeting was held on Tuesday at the offices, New Bridge-street, E.C. Mr. J. S. R. Phillips (*Yorkshire Post*), chairman of the Association, presided. The report and accounts having been adopted, Mr. Meredith T. Wittaker, of the *Scarborough Evening News*, was elected to fill the vacancy on the committee of management caused by the retirement by rotation of Mr. William Brimelow (*Bolton Evening News*), and Mr. Brimelow was elected to the Consultative Board in the place of Mr. David Duncan (*South Wales Daily News*), Cardiff, who retired by rotation.

PICTORIAL NEWSPAPERS. LTD.—A dividend is declared of 10 per cent. (2s. per share) on the deferred shares for the half-year, making 20 per cent. for the year, £10,000 to reserve, and £7,250 carried forward.

NEW COMPANIES.

ZAEHNSDORF, LTD.—Registered on April 30th, with a capital of £10,000, in £1 shares, to carry on the business of bookbinders, booksellers, stationers, printers, lithographers, photographic printers, engravers, etc., and to adopt an agreement with J. W. Zaehnsdorf. The subscribers are J. W. Zaehnsdorf, Mrs. K. Zaehnsdorf, and E. J. W. Zaehnsdorf. Private company. The directors are to number not more than two. J. W. Zaehnsdorf is the governing director. Qualification of governing director 3,000 shares (of which 1,500 shall be ordinary); of other directors one share. Registered offices, 53, Berners-street, W.

J. R. O'DRISCOLL, LTD.—Registered on April 29th, with a capital of £3,000, in £1 shares, to take over the business of a dealer in tobacco, cigars and smokers' requisites, printer, stationer, fancy goods dealer, registry office proprietor, etc., carried on by J. R. O'Driscoll at Lowestoft. The subscribers are J. R. O'Driscoll, Mrs. E. O'Driscoll, P. L. Swindell and C. C. Culf. Private company. The number of directors is not to be less than two nor more than five; the first are J. R. O'Driscoll, Mrs. E. O'Driscoll, P. L. Swindell and C. C. Culf. Qualification, 25 shares. Remuneration as fixed by the company. Solicitor: E. E. Johnson, Lowestoft. Registered office: Dagmar House, London-road, Lowestoft.

VALPY AND CO., LTD.—Registered on April 26th, with a capital of £1,500, in £1 shares, to carry on the business of printers and publishers of newspapers, magazines and other works, general printers, advertising agents, etc. The subscribers are F. E. Parmenter, and G. P. Charles. Private company. Table "A" mainly applies. Registered office: 37, Furnival-sireet, E.C.

GEO. H. JAMES AND OWEN, LTD.—Registered on April 25th, with a capital of £6,000, in £5 shares, to take over the business of a wholesale and retail stationer, printer, etc., carried on by Geo. H. James and Co., Ltd., at Stroud, and the similar business carried on there by H. M. Owen. The subscribers are H. Workman, and H. M. Owen. Private company. The number of directers is not to less than three nor more than five: the first are H. Workman, H. M. Owen and C. A. Carter. Registered office: 14, Russell-street, Stroud, Gloucester.

EVANS BROTHERS (LONDON), LTD.—Registered on April 28th, with a capital of £500, in £1 shares, to carry on the business of publishers, printers, typefounders, lithographers, etc. The subscribers are E. W. Evans and R. C. Evans. Private company. The numbers of directors is not to be less than two nor more than five; the first are R. C. Evans and E. W. Evans (both permanent). Qualification of directors, £50. Registered office: Sardinia-house, Kingsway, W.C.

SUSSEX PUBLISHING CO., LTD.—Registered on April 28th, with a capital of £1,000, in £1 shares, to take over the business carried on by Alice Hayward at Chatsworth-buildings, Worthing, as the "County Publishing Company," and to carry on the business of newspaper proprietors, general publishers, printers, etc. The subscribers are Mrs. Alice Hayward, Miss E. Phillips and E. B. Hayward, Chatsworth-buildings, Worthing, printer and publisher. Private company. E. B. Hayward is the first managing director. Registered office: 46, High-street, Worthing.

A. McKIN, LTD.—Particulars filed April 23rd. Registered in Canada with a capital of $500,000, in shares of $100 each, to carry on the business of general advertising agents. British address: Canada House, 4-5, Norfolk-street, Strand, W.C., where W. Keeble is authorised to accept service.

TELEPHONE: 2595 CENTRAL.

T. B. LAWRENCE, LTD.—Registered on April 28th, with a capital of £7,500, in £1 shares, to take over the business carried on by T. B. Lawrence, at Effingham House, Arundel-street, W.C., and to carry on the business of advertising agents and contractors, entrepreneurs, publishers, newspaper proprietors, etc. The subscribers are: J. P. Eyland and T. G. Conyer. Private company. T. B. Lawrence is permanent governing director. Registered office: Effingham House, Arundel-street, W.C.

COMPANY MORTGAGES AND CHARGES.

Fresh Obligations registered pursuant to Section 10 of the Companies Act, 1907, and Satisfaction registered pursuant to Section 16 of the Companies Act, 1900. (The registration of Satisfaction is not compulsory.)

WM. BUTLER (BRADFORD), LTD.—Particulars of £500 debentures, created April 3rd, 1913, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged—the company's undertaking and property, present and future, including uncalled capital. No trustees.

KING BROS. AND POTTS, LTD.—Issue on March 31st, 1913, of £100 debentures, part of a series of which particulars have already been filed.

CARBON PAPER SUPPLY CO., LTD.—Issue on April 22nd, 1913, of £200 debentures, part of a series of which particulars have already been filed.

DAVIS, LTD.—Mortgage dated April 25th, 1913, to secure £3,000, charged on leasehold land and buildings known as Forward Printing Works, 65-69, Great Charles-street, Birmingham. Holders—W. J. Halsey, Ray Lodge, Maidenhead; and A. A. Barnard, The Wilderness, East Molesey, Surrey.

MEMPES PRINTING AND ENGRAVING CO., LTD.—Particulars of £25,000 debentures, created April 18th, 1913, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged:—the company's undertaking and property, present and future, including uncalled capital. No trustees.

HEREFORD TIMES, LTD.—Trust deed dated April 22nd, 1913, as collateral to a series of £11,500 debentures, charged on offices occupied by the company, in Maylord-street, Hereford, and garden ground in rear thereof. Trustees, F. R. James and E. C. Gurney, Hereford.

COMPANY NOTICES.

ANGLO-FOREIGN REVIEWS, Ltd.

Notice is given, that the creditors of the company are required, on or before June 9th, to send the particulars of their debts or claims to Ed. A. Adcock, 24, Coleman-street, E.C., the liquidator of the company.

COMMERCIAL INTELLIGENCE.

Re ARTHUR HENRY EMONS.
Patent Letter Files.

This bankrupt, who was described as of 38, Basinghall-street, E.C., and for a time acted as receiver and manager of the Thomann's Patent File Co., applied on May 1st to Mr. Registrar Hood, at the London Bankruptcy Court, for an order of discharge. Mr. Daniel Williams, official receiver, reported that the applicant failed in November, 1904, with ranking liabilities between £350 and £400, and no assets whatever. For some years prior to February, 1903, the bankrupt was employed

Digitized by Google

as clerk and traveller to a firm of stationers carrying on business under the style of The Thomann's Patent Letter File Co., in which the petitioning creditor and one Strumpf were the partners. The petitioning creditor having taken proceedings for the dissolution of the partnership, the bankrupt was then appointed receiver and manager of the business by an order of the Chancery Division obtained on the application of the petitioning creditor. In May, 1904, the bankrupt was removed from the receivership at the instance of the petitioning creditor. He attributed his insolvency to liability for the costs of the petitioning creditor in connection with the proceedings taken to remove him from the receivership and to other law costs. After hearing Mr. Frank Mellor in support of the application, His Honour upheld the report of the official receiver, and imposed a further suspension of two and a-half years. Order entered accordingly.

Re WILLIAM THOS. HEDGES, Publicity Agent, etc.

The first meeting of creditors was held last week at the London Bankruptcy Court, under a receiving order made against this debtor, described as of Arundel-street, Strand, W.C., and Cliff House, Mapledurham. Mr. W. P. Bowyer, official receiver, reported that the debtor had not yet lodged the statement of his affairs. He roughly estimated his total liabilities at £15,000, but regarded the bulk as contingent, and returned the unsecured at about £3,000. The assets included a life policy, certain furniture and shares in W. T. Hedges, Ltd., and the "Chronicle" Co., Ltd., on which no present value was placed. At present the debtor was not carrying on business on his own account, but was retained by the liquidator of W. T. Hedges, Ltd., at a salary of £10 per week. He was formerly governing director of that company, which carried on business in Arundel-street, W.C. The company was formed in 1904 to carry on a publicity business, and the debtor was appointed governing director at a salary of £1,000 per annum, subsequently reduced to £500. He retained control of the business until the company went into liquidation in March, 1913. During 1907, W. T. Hedges, Ltd., acquired the whole of the shares in the Berkshire "Chronicle" Co., Ltd., the debtor took over the control of the works, and acted as editor of the paper. In connection with that company he had guaranteed a large amount of debts for goods supplied and other liabilities. The Berkshire "Chronicle" Co. started sub-papers at Newbury, Windsor, Slough, Maidenhead and other places. In 1911 the Berkshire "Chronicle" Co. went into liquidation, and the assets were purchased by another company formed for the purpose under the style of the "Chronicle" Co., Ltd. Eventually the latter company went into liquidation, when the debtor was called upon to pay the liabilities he had guaranteed for the company, and proceedings were taken against him by some of the creditors. In consequence of the failure of the "Chronicle" Co., Ltd., W. T. Hedges, Ltd., suffered considerable losses, and had to go into liquidation. Several creditors who had obtained judgment against the debtor under the guarantees had levied execution at his residence, and as he could not pay his debts he decided to file his petition. He attributed his insolvency to the failure of the "Chronicle Co.," Ltd., and to his liability as guarantor for debts of that company. After a long discussion regarding the nature of a publicist's business, in the course of which the debtor said it was a well defined term in the dictionary, a resolution was passed for Mr. Misbett and Mr. Partridge to act as joint trustees, and administer the estate in bankruptcy with the assistance of a committee of inspection.

Re BERNARD BROWN, Printer, etc.

A sitting of the London Bankruptcy Court was held last week, before Mr. Registrar Hope, for the public examination of this debtor, who formerly carried on business at Ranger-road, Upper Norwood, under the style of the Cosmopolitan Printing and Advertising Co. He returned gross liabilities £1,374 19s. 7d. (unsecured £718 11s. 7d.), and assets of no present realisable value. Replying to Mr. E. Leadam Hough, senior official receiver, the debtor stated that from 1898 to 1901, he and another person carried on in partnership a printing business at Lamb's Conduit-street, W.C., but then abandoned it. The debts of that partnership business were all discharged. Witness was subsequently employed in a similar business, of which from 1904 until 1908 he was managing director. The business was wound up in the last named year. From December, 1908, he carried on the business of printer and advertising contractor at Ranger-road, Upper Norwood, at first in his own name, and later as the Cosmopolitan Printing and Advertising Co., until November, 1911' when he sold it to a company which he formed as the Cosmopolitan Printing and Advertising Co., Ltd. He had then sold a portion of the business to Mr. Wright, who was really the promoter of the company. The consideration for the sale to the company was £2,498 10s., which was paid in shares, of which he received two-thirds, and Mr. Wright the remainder. Witness became managing director and should have received a salary of £350 per annum, but did not take it; the business was doing very well, and his salary was used in developing it. They started the *House and Home Exchange Journal*. Both witness and Mr. Wright made advances to the company, in return for which they were given bills, which were afterwards converted into debentures, he (debtor) having bonds to the extent of £1,000, and Mr. Wright £500. No interest was paid on the bonds, and in December last when the sheriff's officer was put into possession by the landlord they appointed a receiver on behalf of the debenture holders. The Official Receiver: What prospect had the business of paying interest on the debentures? The debtor explained that the difficulties arose through the loss of the company's chief customer. It was not likely that the debentures would be paid off in full, and, as a consequence, the shares of the company possessed no value whatever. Witness had placed one £250 debenture with the South Western Bank, and the other three were held by his solicitor against costs, the value of the bonds being now estimated at about £40 each. He attributed his own insolvency to the failure of the company. Since 1898 he had earned commissions on the sale of properties belonging to other persons, and had also had dealings on his own account in freehold, leasehold and other properties. In this connection he, in October, 1911, obtained an option for the purchase of a plot of freehold land at Hove, and had since entered into an arrangement with other persons with the view of financing the building of a theatre thereon. Also in March, 1910, he purchased another plot of freehold land at Ranger-road, Upper Norwood, but beyond obtaining plans for the erection of Assembly Rooms thereon, had since done nothing. He had further, since December last, been associated with three other persons in carrying on the Assembly Rooms, Crouch End, the lease of which was in his name. These schemes had all resulted in a loss, which further contributed to his insolvency, other causes being interest on loans and law costs. The examination was ordered to be concluded.

Re J. F. WILSON and SON, Printers and Stationers.

Under a receiving order made against John Frederick Wilson, lately trading as above at 115, Fore-street, E.C., the first meeting of creditors was held recently, at the London Bankruptcy Court, before Mr. Egerton S. Grey, official receiver. The statement of affairs was not lodged, but the chairman reported that the liabilities were roughly estimated at £1,000, and there were no assets of value. It appeared that the debtor was in employment until February, 1911, and then started the above business. He had no partner, although trading as J. F. Wilson and Son, and had no capital. The business was closed down on February 4th, and the failure was attributed to bad trade, heavy business expenses, and lack of capital. In the absence of any offer, the case was left in the hands of the official receiver to be wound up in bankruptcy. The public examination of the debtor is fixed for May 27th.

Re CHARLES AUGUSTUS NOAD, Law Stationer.

Under the failure of this debtor, who carried on business at 59, Carey-street, Lincoln's-inn-fields, W.C., the first meeting of creditors was held the other day, before Mr. W. P. Bowyer, official receiver, at the London Bankruptcy Court. A statement of affairs was presented showing liabilities £158 3s. 11d. and assets valued at £13 8s. 5d. The chairman reported that it appeared from the debtor's statements that he took the business over on the death of his father in 1882, and being too young to manage it himself he carried it on for a little while under management. He never had any capital and had been in difficulties throughout, but contrived to keep the business going until 1895, when he was made bankrupt. He continued to trade, and obtained a discharge from the bankruptcy in 1899. The business had gradually declined for some years past, owing to the influx of the typewriter, which had practically killed the engrossing and copying part of his trade. No offer being submitted, the estate was left in the hands of the official receiver to be wound up in bankruptcy. The following are creditors, viz.:—

UNSECURED.

R. Barber, London	£81
Pulleyn and Co., London	48
Somers, Ltd., London	16

A WORD OF CAUTION.

In giving the official Gazette information, it must be distinctly understood that we take official records as we find them, and accept no responsibility for inaccuracies, while, as an almost invariable rule, the facts will be found correct. We advise our readers, before forming hasty judgment, to consider that there may be in each case a satisfactory explanation which does not appear on the records.—Ed.]

ENGLAND AND WALES.

PARTNERSHIPS DISSOLVED.

PARBURY, J. E., F. L., and F. O., trading as Parbury Bros., at Grove-street, Coventry, printers and stationers. Debts by F. L. and F. O. Parbury, who will continue to carry on the business under the same style. May 1st.

WILDT, A. E., KRAY, H. J., and LEWIS, H., trading as the Willesden Fine Art Printing Co., at Ravenscroft Works, Scrubbs-lane, Hammersmith, W., and 86a, Leighton-road, Kentish Town, London, N.W., stationers, printers, lithographers, gelatiners, etc. Debts by A. E. Wildt and H. J. Kray, now of 116-120, Golden-lane, E.C.

DISTRIBUTION OF ASSETS.

TILSON, W., late of 16, Butcher-row, Beverley, Yorks, stationer. Claims by June 3rd to H. Hodge, Hengate, Beverley, solicitor for the executor.

PIERCE, E., late of Willoughby House, Dolwyddelan, Carnarvon, bookseller. Claims by June 1st to J. D. Jones, Llanrwst, solicitor for the executors.

THE BANKRUPTCY ACTS, 1883 AND 1890. RECEIVING ORDERS.

WATKINS, E. J., 34, Marsh-street, Bristol, stationer and printer. Date of order, May 2nd, made on the debtor's own petition.

BELL, W. A., 40, Station-road, and 19, Hatchlands-road, Redhill, Surrey, stationer and printer. Date of order, May 1st, made on the debtor's own petition. First meeting of creditors, May 15th, 2.30 p.m., at 132, York-road, Westminster-bridge-road, London, S.E. Public examination of debtor, May 22nd, 11 a.m., at the County Court, Scarbrook-road, Croydon. Date of adjudication order, May 3rd.

NOTICES OF INTENDED DIVIDENDS.

BLOOMFIELD, W., 50a, Victoria-street, Great Grimsby, printer and publisher. Claims by May 21st to J. F. Wintringham, official receiver, St. Mary's Chambers, Grimsby.

SCHLOESSER, F., Gumley Cottage, Kew Green, Surrey, journalist. Claims by May 17th to E. W. J. Savill, official Receiver, 132, York-road, Westminster-bridge-road, London, S.E.

APPLICATION FOR DEBTOR'S DISCHARGE.

COX, H. D. F., the Garrick Club, Garrick-street, and Jermyn-court, Jermyn-street, London, W., newspaper proprietor. To be heard May 21st, 11 a.m., at Bankbruptcy-buildings, Carey-street, W.C.

Newcastle-on-Tyne Press Bowling CLUB.

The season was opened on Monday by the Newcastle Press Bowling Club with a match between the President's team and the Secretary's team. Owing to the club green having been relaid at the back end of last year and not yet quite fit to play on, the game took place on the Leazes Green. Unfortunately, owing to business engagements, the President (Mr. E. Tebbut) was unable to be present, also Mr. Whitehead. After a pleasant game, victory rested with the Secretary's (Mr. A. E. Longstaff) team. Score:—

A Printing Press Action.

Linotype and Machinery, Ltd., *V.* Miehle Printing Press and Manufacturing Co., Ltd., and Others.

In the Chancery Division, before Mr. Justice Swinfen Eady, the trial of this action was proceeded with. On Wednesday of last week Mr. William Saxon, a vice-president of the Miehle Printing Press and Manufacturing Co., of Chicago, gave evidence. He said he supervised the manufacturing department of the Miehle Company. Since March, 1899 (the date of the assignment of inventions), down to the end of 1911, they never sold any of their presses in this country except for the account of the Printing Machinery Co., the Machinery Trust or the Linotype Co. (predecessors of the plaintiffs). Witness said he had nothing to do with the making of the contract in question. On February 21st, 1913, witness went to the office of the Press Printing Co., at Berlin, and saw two presses manufactured by the Linotype Co. which had the name of the company and the description L. and M. on the side frame. These two presses as regarded the bed motion, were similar machines to that which the Miehle Co. were making in America at that time.

Cross-examined, the Miehle Co had taken out a number of patents at different times in reference to various parts of the Miehle machine.

Mr. Astbury: There are two real characteristics of this Miehle press: one is the heavy bed plate, with its reciprocating movement?—Yes.

And the other is that the cylinder has two revolutions for each printing, and always goes in the same direction?—That is right.

Now, however many bed plates or cylinders you put on a machine these two characteristics would always be there?—Yes.

Whatever you do to these machines you cannot make more than a single cylinder print off any particular box of type?—No.

And the essential qua printing of these machines is that a box of type is contained in a heavy rigid plate, and prints under one single cylinder?—That is correct.

Mr. Arthur Bentley, first vice-president of the American company, said he and Mr. Kelly, the President, became connected with the Miehle Co. in 1910. The first time witness met any of the Linotype Co. was in the beginning of 1911, when Mr. Taylor and Mr. Walker went to Chicago. Mr. Taylor made a proposal that an alliance between the Miehle Co. and the Linotype Co. would be advantageous to both companies, and he suggested that perhaps the most practical way of bringing it about would be an agency arrangement under which they would sell the Miehle press in Europe. Mr. Taylor said England was their territory, and that they had substantially equal rights with the Miehle Co. on the Continent. Nothing was then decided, and Mr. Kelly and witness came to Europe, and witness arrived in London in May, 1911. The English company was formed, and Mr. Kelly and he became shareholders.

Sir Edward Macnaghten: Was any of the money provided out of the funds of the American company?—None whatever.

Was the formation of the English company arranged by yourself and Mr. Kelly?—Entirely, in conjunction with Mr. Wood.

By Mr. Upjohn: The American company found no funds for the English company. It was not true to say that since the incorporation of the English company it had been the nominee of the American company. So far as he knew, the English company had never acted as the agent for the American company.

Has the American company any interest in the stock or capital of the English company?—None whatever.

Cross-examined by Mr. Astbury: The policy of starting subsidiary companies in this country was discussed before he left America. The American company was not acting in Germany and France through agents. The company's business in France was done by a company of the same name only in French. He formed that company during the visit to Europe in 1911. The expenses incurred by him during that visit so far as they related to business were paid by the American company. The French company was formed by himself and Mr. Kelly for the purpose of buying machines from the American company and selling them in France.

Exactly the same kind of company as you formed in England?—Yes.

Did you communicate with the American company when you formed these companies?—No.

Were these companies formed without the knowledge of the American company?—The arrangements were all made before the American company knew anything about it. Mr. Kelly informed the American company officially after he got back.

Re-examined: The English, French and German companies were not subsidiary companies of the American company. He and Mr. Kelly in the formation of those companies did nothing antagonistic to the interests of the other shareholders in the American company.

The hearing was again adjourned.

On Thursday Mr. Charles Henry Fisher was examined and cross-examined on the technical details of various types of printing machines. Mr. Washington Wood was also called and examined by Mr. Upjohn, who said he was managing director of the English defendant company. In 1887 he was in the service of a printing press company in the United States, and in 1899 he entered the service of the old Printing Machinery Company, and was with the successors of that company, Linotype and Machinery, Ltd., until September, 1910. He left the Linotype Company on quite friendly terms. In September, 1910, he had no communication at all with the American Miehle Company, or with Mr. Kelly, or Mr. Bentley, the officers of that company. He went to America early in October, 1910, and met Mr. Kelly some time after October 22nd. Ultimately he was employed by the Miehle Company to go through the different countries of Europe and investigate the printing business and report on it and sell printing machines. That employment lasted until September 1st, 1911. In May of that year he met Mr. Bentley in London. He had made his round of the Continental countries, but had not reported on them all. In the course of the discussions with Mr. Bentley the formation of an independent company to sell the machines of the American company was mentioned. Mr. Bentley asked him if such a company were formed how much money he would be prepared to put into it? Witness said from £3,000 to £5,000. The matter was further mentioned at an interview with Mr. Kelly and Mr. Bentley on June 2nd, but no positive arrangement was entered into until some time in July, and in that month the company was formed. Witness and a Mr. Buckley were the signatories of the memorandum and articles. The amount of capital subscribed was £15,000, and 3,000 shares were allotted to witness. There had been called up 10. per share, and he had paid his £1,500. Out of your own money?—Yes. Witness, replying further, said he had no interest in the American company. The English company was not promoted by the American company. He was not aware of any transactions in which the English company had acted as the agent or the nominee of the American company. There was no truth in the statement that the English company was managed by the officers of the American company. The English company was managed by witness, and he received no remuneration nor did he get any benefit whatever from the American company. The English company had no interest in the American company, except as sellers of their goods. He had negotiations with Mr. Bentley as to the prices the American company would charge the English company, and he agreed to certain prices and to get the American company to approve of them.

By Mr. Astbury: How long were you employed by the plaintiff company and their predecessors?—From 1899 to 1910. Witness, replying to further questions, said that when he left the Linotype Co. he was aware of the agreement between the Chicago Co. and the Printing Machinery, Ltd., and that the agreement was that the Miehle Co. were not to sell their printing presses in this country. Did you know that the patents in this country had been purchased by your employers?—Yes.

The hearing was again adjourned.

On the Court resuming on Friday, Mr. Washington Wood's cross-examination was resumed. In his evidence he said that the prices that were arranged between him and Mr. Bentley, of the American company, were prices which enabled the English company to make a profit.

Mr. Astbury: And no commissions or discounts were allowed by the American company to the English company other and above those prices?—No.

The machines were all paid for in England—paid for by bills drawn on London?—Yes.

It was part of the arrangement between you and the American company that the American company should have its full profits on the sale, and that all insurance and freight charges, and things of that character, should be ultimately borne by your company?—The arrangement was that the American company was to deliver to our company in Chicago the machines, and that we were to sell them as principals.

Witness was asked by Mr. Astbury several questions relating to certain affidavits, and was then re-examined by Mr. Upjohn: Was there any arrangement between you and Mr. Bentley as to what business the English company should do and how it could be carried on?—No, that was left to me.

His Lordship asked the witness to read a particular passage from one of his affidavits, and the witness read as follows: "It is not the fact that the English company was formed by, or has at any time acted as, agents for, or in co-operation with, the American company in the sale of presses in the United Kingdom."

"Acted in co-operation with the American company." Do you still adhere to that? asked his Lordship.—Yes, other than when they ship the machines to England.

On Monday, Sir Charles Macnaghten, K.C., summed up the case for the Miehle Printing Press and Manufacturing Co. of Chicago. He said the plaintiffs, in not having carried out the bargain made by the Printing Machinery Co., were not in a position to maintain the action. The plaintiffs had sold on the Continent machines with a double-sheet delivery, and it was obvious in regard to these that the American company must have sustained a loss, because, presumably, the machines would have been sold by the American company if they had not been sold by the plaintiffs; and there was no one they could sue for damages. Having been on to the Continent with machines fitted with the sheet delivery mechanism, and so invaded the American company's territory, it was quite obvious that the agreement was at an end and the plaintiffs could not get an injunction. Counsel also submitted that the American company had not broken the agreement, because they had not sold or advertised the Miehle machines in this country. They had sold to the English company outside the territory, who had sold in the territory, but that was not a case of the American company competing with the plaintiff company. The English company never accounted to the American company for the profits it made, and in no sense could the former be said to be the agent of the latter. The French, German and English companies all bought at the same price from the American company. Therefore, his submission was that the English company was an independent company, formed to be a real purchasing company.

Mr. Vernon, for the English company, said with regard to the allegation of the plaintiffs that the English company was the agent or nominee of the American company, and that its formation was a fraudulent device of the American company to evade its obligations under the agreements, the evidence was clear that the English company was not the agent of the American, and that there was no fraud or concealment in the formation of the English company. Neither company held any of the shares of the other, and the relation of the two companies was that of purchaser and vendor.

The hearing was again adjourned.

On Tuesday, Mr. Astbury replied for the plaintiffs, and said that the agreements were not agreements which contained parts that were non-separable. The plaintiffs purchased two things: they gave a large sum of money to exclude any further competition in this country in the Miehle press or similar single-cylinder press; and, secondly, they bought a patent—two totally different matters Plaintiffs made no claim to continue to sell the patent delivery mechanism abroad so long as they sought to enforce the contract. They had done it, but the question was whether they had so acted as to indicate an intention to abandon the agreement as a whole, and whether that intention had been accepted and acted on by the defendants. It was perfectly plain it had not. He would assume against himself that the plaintiffs could not ask for damages in respect of a breach by the defendants of a particular covenant relating to the delivery mechanism without being liable to have set off against those damages any damages that the defendants had suffered from a breach of the covenant, but he submitted that he was entitled—if at the lead he took the attitude that the plaintiffs did not claim the right to continue the sale of the patent delivery mechanism abroad—to have the contract enforced, because it was not abandoned, nor was the abandonment one of which the defendants had accepted the result. Counsel asked for an injunction against both defendants and for damages, and submitted, as a set-off, to any damages for plaintiffs sending machines abroad in breach of the agreement.

His Lordship reserved his judgment.

The Stationery Committee of the Bury Town Council met last week, and accepted a report of the Stationery Sub-committee with respect to the placing of contracts for printing and stationery for a period of three years.

Safety Bronzing Cabinet

Patent No. 11291/10.

Cabinet Open, and showing Detachable Tray.

BEST QUALITY WORK
NO DANGER TO OPERATOR
NO WASTE OF BRONZE
INCREASED OUTPUT

THIS Bronzing Apparatus has been introduced to enable Bronze Powders, etc., to be applied by hand without any particles of powder floating about the room, or being inhaled by the operator.

It consists, as shown in the illustration, of a box fitted with hinged transparent top and transparent ends. The side nearest the operator has apertures fitted with flexible sleeves with springs to close round the wrists of the operator, so that, although his hands and arms are free to move inside the box, no powder can escape.

The bottom of box is perforated and allows the surplus powder to fall into a detachable tray underneath. The sheets or cards to be bronzed are fed direct from the platen into a narrow horizontal slit fitted with sloping feed board.

This apparatus is made throughout in our own Works, and the edges of the lid and detachable parts are made dustproof. There is no waste of bronze and no injury to the health of the operator, and nothing to wear out. The bronzing is executed immediately under the eyes of the operator, ensuring finest quality work.

JOHN HADDON & CO.
SALISBURY SQ.
FLEET STREET,
LONDON, E.C.

Cabinet in use.

This Cabinet is designed to cope with work up to and including Foolscap Folio in size **Price £3-3-0**

Other sizes to order at proportionate prices.

ACCEPTED BY H.M. FACTORY INSPECTORS. **FACTORY AND WORKSHOP ACT, 1901. This appliance complies with the instructions contained in this Act and which reads as follows: "Regulations 2.B. Appliances so constructed as to prevent as far as practicable the escape of dust into the air of any occupied room."**

New Sources of Paper.

Hedychium Coronarium.

We are indebted to the *Kew Bulletin* for the following particulars concerning *Hedychium Coronarium*, Koen, and others, as new sources of papermaking materials:—

Early in 1912 Messrs. Clayton Beadle and Stevens drew the attention of Kew to the value of *Hedychium coronarium* as a source of material for papermaking.

This plant, a member of the Natural Order *Zingiberaceae*, is a native of India, being distributed from the Himalayas to Ceylon and Malacca, ascending to 4,000 feet in the Khasia Hills and 6,000 feet in Ceylon. It is also recorded from Central America, the West Indies, New Zealand, Mauritius and West Africa (Corisco Bay). Many years ago it appears to have been introduced into Brazil and it has run wild in many of the States, being especially abundant at Morrettes in the State of Parana, where it has covered a large tract of swampy country.

The plant in its naturalised condition in Brazil is shown in the illustration. When the introduction to Brazil took place is uncertain. There is a specimen at Kew, collected by Dr. Glaziou in 1869, and the presence of the plant in Brazil is recorded by Martius and K. Schumann. These authors mention that the plant is known by the native names "Lagrimo de Moçá" and "Escaldamao." According to some Portuguese documents quoted by Messrs. Clayton Beadle and Stevens the plant is sometimes known in Brazil as wild Jasmine.

The Genus *Hedychium*, of which a good description by Baker is to be found in Hooker's Flora of British India, vol. vi., p. 225, is characterised by the horizontal tuberous rootstock, which bears the erect elongated leafy stems. The leaves are distichous, oblong or lanceolate, with long clasping sheaths. The inflorescence forms a terminal spike.

H. Coronarium is best distinguished from other species of the genus by the following characters:—Inflorescence ellipsoid or ovid; 3-5-flowered bracts which are densely imbricate in 5-8-spirals. Staminodia oblong-lanceolate, white. Labellum widely obcordate, white with yellow sometimes near the base. Filament white.

At Kew the plant thrives under tropical swamp conditions in House No. 15, and is an object of beauty throughout the summer and autumn with its spikes of fragrant white flowers. The photograph reproduced in the *Bulletin* is taken from one of the Kew plants, and the numerous, closely-arranged leafy stems springing from the creeping rhizomes

From the *Kew Bulletin*, by permission of H.M. Stationery Office.

DORRINGTON BROTHERS,
111, Farringdon Road, London, E.C.

TO TRADE BOOKBINDERS, BOOKBINDERS' PLANT AND MATERIAL MANUFACTURERS AND DEALERS, PUBLISHERS, LIBRARIANS, AND OTHERS INTERESTED IN THE BOOKBINDING INDUSTRY.

THE Publishers of the *BRITISH AND COLONIAL PRINTER AND STATIONER* have pleasure in announcing that an ILLUSTRATED MONTHLY SECTION of that journal is now devoted to matter concerning the BOOKBINDING TRADES.

All branches of bookbinding are dealt with, from practical and technical standpoints, and the historical and artistic aspects of the industry also receive attention. Illustrations of hand-tooled bookbindings and publishers' cases which are remarkable for their artistic design, their historic interest, or their novel character are presented from time to time.

The BOOKBINDING SECTION appeals to all those who are interested in bookbinding, whether as a trade or as an art, as all phases of the subject receive their due share of attention in its columns.

The Editor will welcome any news of trade interest that may be sent him, and is prepared to consider original articles of a technical and practical character, with a view to their publication. Information concerning the working of the technical classes in bookbinding, and notices of meetings of trade unions and other bodies associated with the bookbinding industry, are also invited; arrangements can usually be made, if desired, to report the latter, as well as lectures, etc., for the BOOKBINDING SECTION. Illustrations and particulars of new machinery and appliances, and information concerning new materials and methods for use in the trade, are likewise of interest. The publishers having no end to serve save the presentation of matter of value to the various branches of the trade, the pages of the BOOKBINDING SECTION are open to all, employers and employed, unionists and non-unionists, for the free discussion of trade matters.

As far as READERS are concerned, copies of those issues of the *British and Colonial Printer and Stationer* that contain the BOOKBINDING SECTION will be sent regularly on application, at special rates.

With regard to ADVERTISEMENTS, the bookbinding trade announcements are placed in a POSITION NEXT TO OR FACING READING MATTER in the BOOKBINDING SECTION. ADVERTISING RATES sent on application. Arrangements have been made to circulate the journal in quarters likely to be most productive to advertisers of a return for their outlay, and no effort is spared to study the interests of advertisers and readers alike.

Orders for advertisements in and subscriptions to the BOOKBINDING NUMBERS of the *British and Colonial Printer and Stationer* should be addressed to the publishers:—

STONHILL AND GILLIS, 58, SHOE LANE, LONDON, E.C.

Digitized by Google

can be well seen. At Kew the stems attain a height of about 3–4 feet. In Brazil the plant is described as growing spontaneously and thickly and completely covering the land. The stems are said to reach a height of 1–1½ metres when growing thickly and to be about 2–4 cm. in thickness. On the margins of streams, however, the stems grow as high as 2 metres. After cutting down the stems it is found that some 4–5 months must elapse before a full growth of fresh stems is made.

In order to make certain of the identity of the Brazilian plant whose papermaking qualities had been tested, application for specimens was made to H.M. Consul at Sao Paulo for specimens of the plant. Thanks to the kind services of the Acting-Consul H.M. Vice-Consul at Curityba, a specimen of the plant known in that region as *Hedychium coronarium* has been received at Kew. This proved to be *Hedychium coronarium*, as did also the specimens sent to Kew by Messrs. Clayton Beadle and Stevens from Parana.

The value of the plant for papermaking was brought to our notice in a request for fresh material for the purpose of experimental investigation. Messrs. Beadle and Stevens had already satisfied themselves as to the good qualities of Hedychium fibre from the dried material they had received from Brazil, and were naturally anxious to test it in green fresh condition. The papermaking qualities of the fresh material supplied from Kew were found to be identical with those of the dried stems, and the plant appears likely to be a very valuable source of material for the papermaker.

In a letter to Kew, Messrs. Clayton Beadle and Stevens write:—

"Papers produced from this fibre have even greater tensile strength that the strongest manila papers produced. The strongest manila papers have a strength of 6,000 or 7,000 metres 'breaking length.' This paper has from 9,000 to 10,000. Its elasticity and folding qualities are exceptional. Moreover, it can be made to bear ink and possess parchment qualities without any sizing or other special treatment.

"The reason of this we find to be due to the presence of the cells associated with the fibre, which are of a semi-gelatinous nature, when chemically treated, and dry into the interstices of the paper and produce natural parchment."

Messrs. Clayton Beadle and Stevens recently presented a paper to the Eighth International Congress of Applied Chemistry on the papermaking qualities of *Hedychium coronarium*, and extracts appear in the *Kew Bulletin*.

Messrs. Clayton Beadle and Stevens gave the information that they have dressed some of the fibre from the green stem, and the tensile strength tests indicate that it is almost exactly similar in strength to the best pure manila binder twine. Samples both of the paper and the fibre have been presented to Kew, and have been placed in the Museum.

Owing to the very remarkable papermaking qualities of *Hedychium* and the ease with which the plant spreads under favourable conditions in the tropics, it seems likely that it may be in considerable demand in the near future.

Amomum and Alpinia.

As *Hedychium* has proved to be so valuable a plant for papermaking, stems of *Amomum hemisphericum* and *Alpinia nutans* have also been submitted to Messrs. Clayton Beadle and Stevens for examination as to their papermaking qualities.

In the accompanying report they mention that in neither case do these plants yield papers showing the self-sizing qualities to be observed with *Hedychium*, and under certain conditions also with manila waste, bagasse, and also with banana fibre. The report is as follows:—

"These plants were passed through sugar-crushing rollers for the removal of juices and to reduce same to the condition of tow. They were then boiled under pressure, each with 20 per cent. of soda, the *Amomum hemispheri-cum* being boiled for 4 hours at 40 lbs. pressure, and the *Alpinia nutans* for 6 hours at 50 lbs. They were afterwards bleached, and the yield of unbleached and bleached fibres expressed on the original green weight of stem as received, as follows:—

On green stem as received.	*Amomum.* Per cent.	*Alpinia.* Per cent.
Yield—unbleached ...	7·44	5·93
bleached ...	6·36	4·95

"If expressed upon the dry weight of stem the figures are as follows:—

On dry stem.	*Amomum.* Per cent.	*Alpinia.* Per cent.
Yield—unbleached ...	58·2	50·0
bleached ...	49·6	41·5

"The average length of unbeaten fibres as contained in each of the pulps taken as an average of ten measurements was measured with the following results:—

	Amomum.	*Alpinia.*
Length of fibre ...	2·54 mm.	2·21 mm.

"From a superficial examination of the pulps in each case we think it possible that the *Amomum hemisphericum* could be made to produce a strong brown paper with a long tear. It is also capable of being bleached white. Very much the same remarks may be said to apply to the *Alpinia nutans*."

From Messrs. Clayton Beadle and Stevens' report it would appear that *Amomum* and *Alpinia*, though considerably inferior to *Hedychium*, might nevertheless be quite useful sources of material for the papermaker. *Amomum hemisphericum* is a native or Java. *Alpinia nutans* is recorded from Hong Kong, Formosa, Cochin China, the Eastern Himalaya and the Malay Peninsula. It is also known from the West Indies, Guatemala, Venezuela, Surinam and Brazil, but like *Hedychium* it has probably been introduced into the Western Hemisphere.

Both *Amomum* and *Alpinia* belong to the natural order *Zingiberaceae*. Their habit of growth is quite similar to that of *Hedychium*, and it seems probable that *Alpinia* would form dense thickets in swampy country. The stems of *Amomum* reach a height of as much as 16 feet, and those of *Alpinia* are stated to attain to 8 to 10 feet in height.

Marram Grass.

Among other plants suggested as suitable for the papermaker which have recently been examined in this connection is the common Marram Grass of our coasts, *Ammophila arenaria*, Link.

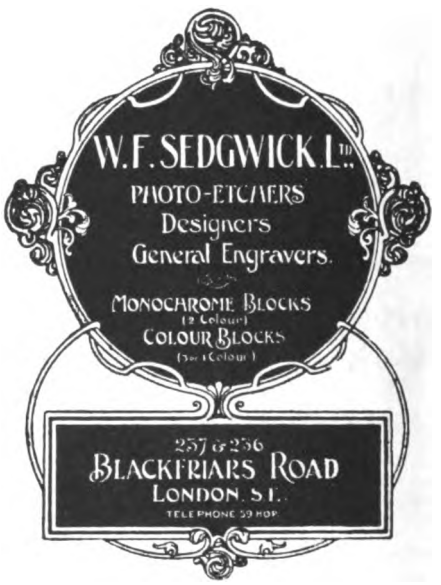
This grass, as is well known, is grown on the sand hills around our shores, and acts as a very valuable sand-binder. It now appears that it possesses quite useful qualities as a source of material for papermaking. Messrs. Clayton Beadle and Stevens have kindly examined a consignment of Marram Grass sent through Kew from the Norfolk sand hills. They inform us that the grass was boiled under pressure, without passing through crushing rollers, and then bleached. The figures for the yield of unbleached and bleached fibres, expressed on the original green weight of stem as received and on the dry weight, are as follows:—

	Green Stem. Per cent.	*Dry Stem.* Per cent.
Unbleached	17·7	31·4
Bleached	13·1	25·0

The average length of unbeaten fibres contained in the pulp taken on an average of ten measurements was found to be 0·65 mm.

Marram Grass is found to produce a soft pulp with a short tear, which more nearly resembles in general feel and external appearance the pulp produced from Esparto or chemical aspen wood pulp.

The primary function of Marram Grass is of course as a sand binder, but it is possible that should it be deemed of sufficient importance as a papermaking material its cultivation could be extended over considerable tracts of sandy country bordering the coast in various parts of the British Isles.



THE London correspondent of the *Manchester Guardian* says that there is some possibility that a prominent London halfpenny paper will raise its price in the not far distant future to one penny. The possibility of this change is exciting some interest in journalistic quarters in London. Feelers have already been put forth on the matter, and it would not be surprising at any moment to have a definite announcement."

THE OLDEST TRADE PROTECTION OFFICE IN THE UNITED KINGDOM.

The Bookbinders and the Proposed NEW AMERICAN TARIFF.

Having regard to the representations made to the U.S. Tariff Revision Committee lately, and referred to in our Bookbinding Numbers for January and March last, some sections of the bookbinding trade in America will no doubt be greatly disappointed to find that their demands for an increased duty on imported books have not been acceded to.

The essential fact is that books, bound or unbound, are neither kept at the present rate of 25 per cent. nor put on the free list, but placed at the intermediate and compromise rate of 15 per cent., which, if maintained, means a reduction of the present duty by 40 per cent. Bibles, bound or unbound, are put on the free list — which will mean a substantial reduction on English printed editions, and will be to the disadvantage of American Bible publishers or else put them on their mettle. No change seems to have been made with respect to the free importation of books by libraries.

What American publishers and binders feared was that the duty on books would be reduced without any corresponding reduction on book-making materials. This, however, has not been done. In general, the prices of book materials have been cut proportionately with, or to a somewhat greater extent than, the reduction in the duty on books. Binders' cloth is reduced to 25 per cent. from a variable rate which averages perhaps 45 per cent., and this reduction will have the effect of permitting the importation of the superior English cloth, which has been kept out by the tariff, of increasing the importation of the inferior German cloth, which has already found its way into the market, and of putting the combination of American book-cloth producers, which has kept a stiff price on American cloth, on their mettle in efficient competion. Buckram and similar fabrics will pay 30 per cent. *ad val.* Goldleaf is substantially reduced by the change from specific (35 cents per 100 leaves) to *ad valorem* (35 per cent.) rates, but the superior American article will probably hold the field, at possibly a slightly lesser price, against English competition with the thinner and less satisfactory leaf.

The duty on bookbinders' leathers remains unchanged, and so does the famous clause admitting free of duty, "bound or unbound, books which have been printed more than twenty years at the date of importation."

One of the leading American publishers, Mr. Geo. Haven Putnam, wrote a long letter a few weeks since to the Hon. Oscar A. Underwood, Chairman of the Tariff Revision Committee. It contained the following remarks on the foreign bookbinding question:—

"An interpolation was introduced into Section 416 [of the Payne-Aldrich Tariff Act] which was intended to increase, and which, as interpreted by the Courts, has actually increased from 25 per cent. to either 40 per cent. or 60 per cent. the duties on a certain class of imported books. The provision in the previous law had provided for a duty of 25 per cent. *ad valorem*. The section in question was changed in the existing Act by the insertion of the words 'all the foregoing wholly or in the chief value of paper.' It has been held that in the cases in which the value of the material in the cover of the book is greater than the value of the paper, or of the printed sheets contained within the cover, the duty imposed shall be, in place of the 25 per cent. specified for books, the duty assessed upon the material in question. This clause was inserted in the interests, or, rather, in the supposed interests, of certain American binders, who were endeavouring to interfere with, and as far as possible to prevent altogether, the importation into this country of books the covers of which carried artistic designs, designs which brought the books properly under the heading of works of art. The cost of these artistic designs, prepared by designers in art centres such as Paris, London, Florence, Leipzig and elsewhere, ranges from $10 up to $1,000. Such designs are utilised on covers of leather, or occasionally of silk. The result of this interpolation is to make the duty on books bound in leather or in silk, and carrying these artistic and necessarily costly designs, 40 per cent. or 60 per cent. The 'cost' upon which the duty is imposed includes, of necessity, in addition to the actual work of the binder, the amount paid to the designer. One change in the Tariff Act of 1909 constituted a modification in the direction of greater freedom of importation, or in the cancellation of the duty on works of art. This cancellation covered, to be sure, only the works which had been produced more than twenty years back, but it did constitute a recognition of the fact that the barriers between the American public and the art productions of the world should be lessened rather than increased. As above stated, a book of the class now in question is in itself a work of art. The interpolation above cited makes a substantial increase in the duty on a work of art; it is intended, in fact, to prevent the importation, and it must, of necessity, have the effect of preventing the importation of books bound in artistic designs. The result is not only an inconvenienience and an injustice to cultivated Americans, who desire to secure such books (and here I am speaking as a binder), but stands in the way of the development of the art of binding in this country. If the American binder is satisfied with his own present standard of binding designs, he will make no progress towards a more artistic and satisfactory standard. Such progress is made only by the study of and the competition with the higher class designs produced in the art centres of Europe. I point out further that the interpolation in question constitutes an example of what may be described as *surreptitious legislation*. It was slipped in at the last moment during the work of the conference committee. The fact that there had been any change proposed or accomplished in the duty on books was not known even to the leaders of the party who were responsible for the Tariff Act. No opportunity was given to those interested on the part of the book trade, or of the bookbuying public, to consider the proposed change, or to present arguments against it. It is our contention, in which I think the leader of the House is in full accord with us, that whatever changes are made in the tariff system, or in the general taxing system of the United States, should be arrived at publicly, and after due considerate and adequate discussion." Mr. Putnam therefore called for the elimination of the obnoxious clause in question, and the suggestion has been carried into effect. The proposed changes in the Tariff have not yet become law, but it is not anticipated that many, if indeed any, alterations will be made in them. A recent United States Treasury decision confirms the ruling of last year (from which appeal was taken) that leather skins, cut into sheets for binding, are "partly manufactured," and so subject to 25 instead of 15 per cent. duty. The additional 10 per cent. increases the cost of imported leather for binding some of the distinctively bound series, such as Putnam's *Ariel* editions, from 1 to 2 cents per copy, and reduces almost to the vanishing point the slight profit per copy on such series, which are sold at a low price and on large discount. Thus, the existing Payne-Aldrich Tariff has the effect of nearly prohibiting leather-bound editions from abroad, and of increasing the cost of materials for leather-bound editions in the United States.

The above is largely based upon reports appearing in the New York *Publishers' Weekly*, but following the good old axiom of "hear both sides," we reprint below, from the official organ of the International Brotherhood of Bookbinders, the operatives' view of the points at issue. Two delegates from that organisation spent some time in Washington whilst the Tariff Revision Committee was in session, "lobbying." They found that, with few exceptions, the operative bookbinders, notwithstanding their occasional loud demands at meetings for increased duties on foreign-bound books, had shown great indifference to the outcome of the Tariff enquiry. Mr. W. G. Lummis, one of the delegates, said that "Thousands of letters have poured in from religious institutions, teachers and librarians, asking for the abolition of the duty on books, and, outside of a few letters from Philadelphia and New York, none at all from our members. It is my belief that had it not been for the work of the New York Allied Trades Council, and what Brother Feeney and myself accomplished, all books would have been placed on the free list. The reduction as planned in the Underwood Bill will drive fully one-half of our members who work on printed work out of the trade, and they will be compelled to seek other employment, no doubt at a much lower rate of wages—and I know of no bookbinder who is overpaid."

Brother Feeney had much the same tale to tell, only he went into more detail about it, thus: "The bookbinding trade to-day, especially in the East, is very dull, and a large number of men and women are out of employment in New York and other cities. Publishers can now have their work bound in England, pay the present duty, and make a big profit compared with what they would make by having it done in this country. Bookbinders in England and Germany are sending circulars to the publishers of the Eastern cities, soliciting their work, and it is impossible for any of the American binding firms to compete with the foreign binders unless they could reduce wages and increase the hours of labour, and we cannot accept either. I dislike very much to be a 'calamity howler,' but I am compelled to admit that unless we succeed in having the whole duty restored to the Bill in the Senate, we can look forward to extremely dull times in the bookbinding industry. A member of Congress told me about a month ago that, judging from the letters he received, everybody wanted free books, and very few desired the present duty to remain, and as it seems to be the desire of Congress to please a majority of the people, they generally vote as public opinion demands, and we cannot expect any concession whatever unless we request it and fight for it.

"Brother Lummis and myself had a very pleasant interview with Senator William Hughes, of New Jersey, a member of the committee which will have charge of the Tariff Bill. Brother Lummis displayed for the Senator's benefit a half-dozen beautifully

Digitized by Google

bound extra-finish books, costing in labour from $50 to $100 to bind, and he fully explained why a high duty should be placed on such books, as they are without a doubt luxuries, and they should not be imported for the wealthy class under such duty. The books shown the Senator were bound in this country, and I believe Brother Lummis was the finisher, and his wages are more than $11.25 (47s.) per week, which is the maximum rate of wage for extra finishers in England.

"All the 'extra' workers in England and France are kept busy throughout the year binding books for rich Americans, and just as skilled workers in our craft as can be found anywhere are walking the streets of New York and other cities looking for employment, and all on account of the low tariff which has prevailed for many years in our trade. Now, brothers, wake up. To quote the words of a former Democratic President of the United States, 'It's a condition that confronts us and not a theory'; we cannot expect any American publisher to pay two or three hundred dollars more for a job of work when he can save that amount by having his binding done abroad. Let every local union discuss this matter at their meetings and all adopt resolutions and send them in to the Senate Finance Committee. It is useless to waste any ammunition on the Lower House, as the Underwood Bill has the White House approval and it will pass the House by a big majority, as the Democrats have a majority of 145 in the House. In the Senate the majority of the party in power is very small, and every Senator has great prestige and can accomplish more than a dozen Congressmen, if we let them know that our trade is at stake. Thousands of famous novels and histories are given as premiums every year by big publishing houses. As far as I know, the P. F. Collier house, one of the best union houses in the country, do their own work; but I do know there are other publishers who purchase the standard novels, histories and other books from England by the thousand, and if the Underwood Bill is enacted into law several of the big binderies will be compelled to go out of business or work their force continually on half-time."

We are afraid that in fighting the decisions of the Revision Committee at this late stage of the proceedings, the Brotherhood are "up against it considerable," and we have little hope that they will "win out" in the end.

OVER TEN THOUSAND MILES OF ADVERTISING.—The remarkable development of advertising during the past dozen years is recalled by the announcement that Messrs. C. E. Fulford, Ltd., the proprietors of Zam-buk healing balm, and other well-known specialities, have found it necessary to open spacious business offices in a newly-erected and up-to-date four-storey building facing the firm's extensive laboratories at Cärlton-hill, Leeds. Here will now be prepared and despatched the newspaper and magazine advertising for Great Britain and the Colonies, and also a succession of pamphlets, music and novelties with a circulation of many millions annually. Of the Zam-buk Almanack, "The Green Book of Prophecies" alone, over 80,000,000 copies have been distributed up to this year, which means if the books were placed in a row, end-to-end, they would extend over 10,551 miles.

LONDON CENTRE.

The Future Policy of the Association.

At the May monthly meeting of the parent Association the Report of the Special Committee, appointed some twelve months ago to discuss some suggestions that had been made and make recommendations on the future policy of the Association, came up for consideration. The meeting was held at the headquarters, the Old Bell, Holborn, E.C., on Tuesday evening, 6th inst., with the President, Mr. C. J. Gray, in the chair, and there was a good attendance.

Some preliminary business was attended to before the report of the Special Committee was received. The minutes of the April meeting were read by the Assistant-Secretary, Mr. C. Morley, who was congratulated on his reappearance after an absence through indisposition, and the following nomination for membership was confirmed, viz., Mr. A. H. Postle (Messrs. Ward and Foxlow—composing).

A casual vacancy having occurred on the Council by the resignation of Mr. A. R. Closh, the Council appointed Mr. A. W. Hart to fill the position. The recommendation was unanimously confirmed. On the motion of Mr. S. M. BATEMAN, seconded by Mr. C. H. BLENKINS, a vote of thanks was passed to Mr. Closh for his services on the Council.

The CHAIRMAN drew attention to the annual bohemian concert to be held at the Holborn Restaurant (King's Hall) on Saturday, 17th inst.; to the joint gathering of the various Centres of the Association at Liverpool on June 21st, and to the Special General Meeting of the Association at the Salisbury Hotel, Salisbury-square, E.C., on the 19th inst., when they were going to meet members of the Master Printers' Association and discuss the costs question, and he hoped the members would attend in large numbers. He then called upon Mr. E. H. Berryman, the chairman of the Special Committee on Future Policy, to introduce the Committee's Report.

The Chairman's Introduction.

Mr. BERRYMAN, on behalf of the Committee, thanked the members present for attending in such large numbers, and said that whether they were satisfied or dissatisfied with the Report he could thank them just the same, because they showed by their presence that they felt some interest in the matter. He would also like to acknowledge and thank those gentlemen who had sent him some very kind letters, and at the same time to thank his colleagues on the Committee for the kind manner in which at all times they had treated him. His task might have been a very difficult one, but under the circumstances, although some of them flared up occasionally, they had differed and they had agreed to differ. He hoped that whatever they did that night the same spirit would animate them. They would endeavour to meet all the points in a moderate manner, and would give credit to those who differed from them as being as anxious as they were themselves for the welfare of the Association. Continuing, Mr. Berryman said:—The Report which it is my privilege to present to you this evening has already been fully set before the members in terms sufficiently clear to render unnecessary any detailed explanation. Yet it may not be out of place if I add a few remarks upon the constitution and work of the Committee, and also upon some of the points raised in the Report itself.

The Committee were appointed in somewhat peculiar circumstances. A debate had occupied three full evenings, and the members present at the meeting in April, last year, were evidently of opinion that something more was required. So almost on the impulse of the moment they elected a special committee with a mission not too clearly defined. A useful privilege was bestowed in the power of co-option, and the Committee decided at their first meeting to invite four members who had not previously held office in the Association, the idea being that these gentlemen would reflect somewhat the opinion of members generally—that their point of view might perhaps differ from those who had already served the Association in various ways. These selections and hopes were fully justified, as both by their frequent attendance and their interest in every subject raised, they fully demonstrated their usefulness upon the Committee. Some of the more experienced members were not so regular in their attendance and therefore gave less assistance and advice than might have been anticipated. Perhaps they will yet make good in this respect, and let you know the line they would have taken on certain subjects. I am not inclined to complain of those who were frequent absentees. It could hardly have been anticipated that the Committee meetings would cover a period of ten months. That is placing rather a heavy tax upon the leisure time of busy men. Members have their business and social engagements to fulfil, and it is only kind to assume that they attended as frequently as possible.

In the early days of their formation, the Committee invited suggestions from members. The response scarcely justified reasonable expectation. Replies were few, and some quite beyond the power of the Committee to deal with. One of these early suggestions we have alluded to in paragraph 36. A well-known member of the parent Association, in a very pleasant communication, advised district outings on Saturday afternoons with a view to bringing together members who engage in various sports and pastimes. I place this apparently unimportant suggestion in the forefront of my remarks, thinking perhaps there may possibly be a fuller application of its meaning than appears at first sight. There is no question as to the success of our Association. We note a steady growth and rapid extension of influence. And yet there are indications in the parent Association that many of the members are to each other comparative strangers. The meetings cannot be said to attract an attendance proportionate to membership. Just before the meetings commence there is a flow of members to the secretary's table, and one may also note that fully half the number leave almost immediately, apparently having no interest in the meeting to be held, and recognising no friend or acquaintance present. This implies no reproach to the officers or council. A gentleman is deputed to courteously receive all members, and one cannot expect more than this. I think here we have the key to the situation, so far as the parent Association is concerned. If we can only induce members to become better known to each other—provide more attractive meetings, and strengthen the social side of our work here, we shall be effecting a lasting good. We need greater variety in the monthly meetings. Our invariable alternative to a technical lecture is a smoking concert, and while these are useful and entertaining, a wider range might be more attractive to our membership. Lectures by literary and scientific men—also dramatic recitals—are to be obtained for a moderate fee, certainly not in excess of the cost of a concert. And in the broad field of Art, Science and Literature, there are surely many subjects of deep interest to our members. With this end in view the committee suggest the subdividing of a larger council—a section being devoted entirely to the social side. If would be their duty to

arrange and conduct all entertainments, and if possible issue a Syllabus Programme, as customary with literary and county associations.

As stated in the Report, it is also with the intention of imparting greater interest to Association affairs, that the Committee suggest a limitation of tenure in certain official positions. We do not anticipate that a large number of members are anxious to occupy the presidential chairs, or become trustees or treasurer. We quite recognise how faithfully and well the Association has been served by gentlemen occupying those honoured positions. Yet we are of opinion that it would act as an incentive to members to know, that after serving upon the Council they might have an opportunity of promotion. It would also, I think, be useful in another way. An increased number of members fulfilling important offices and duties would strengthen and impart variety to our debates. The holding of office brings responsibility, and responsibility, as we know, produces man's best effort. All societies set a high value upon members who have passed the chairs, and those of less experience naturally look to them for guidance.

The suggested re-adjustment of the secretarial work will, I think, appeal to us all. It is not meeting the question fairly to say that our secretary is fully equal to the task—although it is obviously true. The auditors and others entitled to express an opinion, have only one opinion to express—that of entire and perfect satisfaction. The secretary informed us, in a speech delivered five years ago, that he worked for the Association every Sunday in the year. As the pressure must have increased in the meantime, one can fully appreciate a more recent remark of the secretary, that he might eventually feel inclined to relinquish the task. If he can be relieved of the routine work as suggested, I feel it will not only prove beneficial to himself but also decidedly to the advantage of the Association.

The suggested creation of a new General Fund for the entire Association is fully and clearly explained. It is conceived in a spirit of absolute fairness, the proportion for all members being fixed and equal. The complete separation of "imperial" from local funds would, I take it, give Centres the option of augmenting their local funds, in accordance with their own requirements. It might even form a starting point for a new departure in the direction of federation.

The suggested scheme for providing small pensions will require and no doubt receive your careful attention. The need for some provision in this direction is, that our present pensions are only available for members who are also subscribers to the Printers' Pension Corporation. A member of our committee for whose opinion we have the greatest respect, has placed before you his views in a separate report. It is for you to consider these criticisms, and also the bearing they have upon the committee's recommendation. There is one point to be strongly emphasised, that while we consider a foundation has been suggested for a useful Pension Fund, we fully recognise the fact, that ways and means will need a closer scrutiny than the committee have been able to bestow.

The communication from the vice-president of the North Midlands Centre revives once more the question of the age limit for death benefit. We may reasonably assume the writer to represent the views of the Centre, and if this opinion be also general among the provincial members, the subject presents itself to your favourable consideration.

My final word this evening is upon the clause relating to aged members.—Paragraph 28.—The question is truly a most difficult one. We are all anxious that no undue advantage should be given to individual members, that no opportunity should be afforded to evade the just claims of the Association. Yet there remains with us a moral obligation to aged members in straitened circumstances. When inviting candidates in our early days, the promise was implied "once a member—always a member." The turn of Fortune's Wheel might deprive us of the qualification under which we joined the Association, but loss of position would not cancel membership. In a letter from our secretary to a member of the Manchester Centre published in 1905, these words occur: "Our first object is mutual help and good fellowship. Let that be carried out in all sincerity and automatically the Association will find itself going forward in the future, doing good to its members whenever opportunity offers." Our recommendation has some affinity with the fine sentiment here expressed, and I am hoping that the members may deal with this in a liberal spirit. Our President, on the night of his election told us of the tender and kindly feeling he had for the youths in the workshops and technical schools—the printers of the future. May I remind you that we are seeking your sympathy for some of the printers of the past—those who have fallen out of the ranks, and are too often overlooked and forgotten. There is a tendency among thoughtful men when the full tide of comparative prosperity is with them, to incur liabilities that are easily met while the sun continues to shine. A friendly society—a trade union—life assurance—an association like our own—all promising future reward for present sacrifice. The man who takes this course is termed thrifty, and wise, and far-seeing. He is admittedly a better man and a better citizen than he who takes no thought of the morrow. But as the years multiply and the salary earning power diminishes and finally disappears, a sad prospect often appears in view. He must relinquish the privileges he has hoped for and paid for through sheer inability to continue his payments. It is to meet this misfortune that a life policy has a surrender value—that many friendly societies reduce or remit subscriptions after a term of years. And I respectfully contend that a moral obligation rests with this Association to assist its aged and deserving members in a like manner. There may be few members at the present time needing this assistance, but our recommendations are for future policy. Taking eight hundred members, as in paragraph 22, a full levy of two shillings produces eighty pounds, showing a profit of thirty pounds to carry forward, less management expenses. Supposing even fifty members needed exemption—the loss would be five pounds, equal to three-halfpence per member, and still leave twenty-five pounds profit on each levy to carry forward. It hardly seems reasonable to suppose that this small reduction of profit is going to wreck the Death Benefit Fund—especially as in our recommendation it is suggested to deduct the gross amount remitted from the sum payable at member's death. I am reluctant to unduly emphasise my own opinion, but if quite alone in the view, I should still protest against this *post-mortem* deduction. I regard it as a disfiguring mark upon our Report, and that opinion is shared, I am glad to know, by several of my colleagues.

On behalf of the Committee I have now to commend this Report to your careful consideration and discussion. The subjects you referred to the Committee have been dealt with to the full extent of their powers, which were not to legislate—only to suggest and advise. It is for you, and the members generally, after mature consideration, to accept, amend or reject the proposals, and we of the Committee must be equal to either fortune. That some good may ensue from these recommendations is our reasonable hope, in which case our work for the Association and our fellow members will not have been in vain.

REPORT OF THE SPECIAL COMMITTEE ON FUTURE POLICY.

1. The above Committee was appointed in April, 1912, as the outcome of a lecture by Mr. S. M. Bateman, and a subsequent discussion on the "Future of the Association," in which several members participated. It may here be useful to recall the terms of reference. The Resolution passed at General Meeting was:—"That a Special Committee be appointed to consider the various suggestions, and that they report their recommendations to the members at the earliest opportunity."

2. The Committee applied to the reference a comprehensive interpretation, and the various suggestions were very fully discussed at frequent meetings.

3. Some of the recommendations which follow are general, and, if adopted, will affect the Association as a whole; others are intended to apply to the Parent Association only.

4. The principal clauses of universal application will be found under the heading "Finance." The proposals under "Management" are suggestions for the Parent Association; leaving the Centres to adopt any or all of them as they may deem advisable.

Management.

PRESIDENT AND VICE-PRESIDENT.

5. The Committee consider that opportunity should be afforded for members who have served upon the Council to pass through the Presidential chair. Under the existing rule, the President and Vice-President may retain office for an indefinite time, and members feel reluctant to oppose the holder of an office if he offers himself for re-election. The opportunity to fill an honourable position would, the Committee think, awaken greater interest in the Association's affairs, and the limitation of term by rule would remove any fear of offence. They therefore recommend:

6. That the President be elected for one year, and be eligible for one year's further term of office. At the termination of his tenure of the Presidency he should not be eligible for the same office for three years.

7. That the Vice-President should be elected for one year, and be eligible for one year's further term of office. After termination of his tenure of the Vice-Presidency he should not be eligible for the same office for three years, but should be eligible for the office of President at any time a vacancy arises.

8. That no member should be eligible for the office of President or Vice-President unless he had previously served on the Executive Council or as an officer of the Association.

TRUSTEES AND TREASURER.

9. As the Committee propose that the period of office should be limited as regards President and Vice-President, and as the Council is only elected for two years, they are of opinion that a similar principle should apply to the Trustees and Treasurer, but as certain formalities with regard to monetary transactions have to be arranged when those officers retire, they recommend a limit of three years.

10. That the Trustees and Treasurer be elected annually, but should retire after holding their offices for three years, and not be eligible for either of these positions for two years from termination of services.

COUNCIL AND STANDING COMMITTEES.

11. In view of the Committee's suggestion to sub-divide the work of the Council by appointment of the standing committees mentioned below, they are of opinion that the Council should be increased in number and recommend accordingly:—

12. That the Council should consist of sixteen members—in addition to the officers—and be elected for two years; eight to retire each year, and be ineligible for re-election for two years.

13. That no member should be eligible for election to the Council unless he held at time of nomination a position as manager or overseer of a printing department. That salaried officials be exempt from the operation of this recommendation.

14. That it is advisable for the work of Council to be sub-divided by the appointment of Committees to deal with:—

(a) Lectures and Entertainments, and all pertaining to the social side.
(b) Finance and Unemployment of Members.
(c) Technical Education.

SECRETARIES.

15. The increase in the work of the Secretary through the growth of the Association makes it necessary, in the Committee's opinion, to definitely apportion the work, and to relieve the Secretary of routine work as much as possible. The appointment of a Financial Secretary, who would receive subscriptions and levies, would release the Secretary to attend to other Association business at the meetings and enable him generally to devote more time to the many important matters which arise from time to time. They recommend:—

16. That there should be a General Secretary and a Financial Secretary, whose respective duties shall be allocated as follows:—

General Secretary.—Attendance at General and Council Meetings, minutes, correspondence, conduct of business with Centres, keeping accounts, payment of benefits, preparation and issue of monthly circular, annual report and balance-sheet.

Financial Secretary.—Attendance at General and Council Meetings, receipt of subscriptions and levies (at Meetings and by post), notification of arrears, issue of Council notices, and to assist or act in the absence or indisposition of General Secretary, or as directed by the Council.

17. Monies received by the Financial Secretary to be paid to the Treasurer, through the General Secretary, who shall periodically examine the books.

18. That the salary of the Financial Secretary be fixed by rule, and it should be understood that the remuneration be not increased by honorarium in the case of this or any other salaried officer.

Finance.

GENERAL AND LOCAL FUNDS.

19. The Centres affiliated to the Association pay one-third of their subscriptions and entrance fees to the Parent Association, which undertakes in return the payment of the benefits specified in the rules. Hitherto, the moneys received have been paid into the Association's General Account, and whilst

Digitized by Google

only one or two Centres existed, the matter was not of great importance. The increase in the number of Centres, however, makes it advisable that the local funds of the Association should be separated from the 'imperial." The Committee suggest, therefore, that a new General Fund be created, and that the Parent Association contribute to that fund the same amount per member as the Centres. The local fund of the Parent Association would then be clearly defined, and no idea could arise at any future time that the Parent Association was carrying out any of its own objects at the expense in part of the Centres They recommend :

20. That a separate account, to be known as the General Fund, be kept for purposes common to the whole Association. That the Parent Association and Centres should contribute in like proportion to the said fund, which may be used for payment of all benefits (except death benefit), and bear its due proportion of working expenses.

21. That the remainder of the subscriptions of the Parent Association shall be paid into its local fund, for the purposes of its own affairs.

SUBSCRIPTION AND BENEFITS.

22. The Committee have given careful consideration to the question of the advisability of an increase in the subscription to the Association. The desire of the members to afford greater help to the unfortunate has been freely expressed, but the subscription of 12s. per annum is small, and without additional payment increased benefit is out of the question. Amongst the suggestions made have been Pensions for aged members ; augmentation of Unemployed Benefit, and increased help to the Benevolent Fund. So far as the first proposal is concerned, it would be quite impossible to establish superannuation for all members without a subscription very much larger than that recommended by the Committee, but it is possible in time to accumulate a Fund to provide a limited number of small pensions to which members might be elected. The Committee's proposal is to increase the subscription to 16s. per annum, and to apply the added 4s. per annum to the benefit funds of the Association. As the establishment of a Pension would take some years they have excluded from their view members who would be precluded by age from participation in that benefit, and have taken 800 members as a basis for the following figures, or 20 per cent. less than the present membership. The suggested allocation of the increase is as follows :—

	s.	d.	£	s.	d.
To Pension Fund	1	6	60	0	0
" Unemployed Fund ...	2	0	80	0	0
" Benevolent Fund ..	0	3	10	0	0
" Working Expenses ...	0	3	10	0	0
	4	0	£160	0	0

Taking the first item, this would provide, with added interest, a pension of £15 per annum in about five years, with other pensions to follow at intervals. As created they could be apportioned to the Parent Association or to the Centres from time to time, and it might also be worthy of consideration whether an occasional pension should be paid over to the Corporation so as to retain voting power on behalf of those members who are subscribers. Details would, of course, have to be worked out by a Committee if the general idea is adopted, but this rough outline is sufficient for the purpose of the Committee.

23. The amount anticipated to accrue towards Unemployed payments would enable that benefit to be extended from five to eight weeks for members paying increased subscription, whilst the Benevolent Fund would be helped by a small but useful contribution ; or the £10 might be devoted to the payment of subscriptions of aged members.

The Committee recommend :

24. That the subscriptions be raised to sixteen shillings per annum, a proportion of increase to be allotted as follows :—Pensions for aged members, increased unemployment benefit, Benevolent Fund, and genera purposes.

25. That increase of subscription should not apply to members who, on account of age, would not be eligible to participate in proposed additional or augmented benefits.

VOTING OF FUNDS.

26. The attention of the Committee has been directed to the fact that proposals involving expenditure may be made by members at any time without notice, and passed by a general meeting forthwith. They are of opinion that this power should be restricted to the extent that the members should have due notice of expenditure of any considerable amount. They recommend :

27. That any financial proposal involving an expenditure exceeding ten pounds should not be considered by a general meeting unless the member bringing the proposal forward has given notice to the Secretary in time for the motion to be placed on the agenda for the meeting.

AGED MEMBERS.

28. The Committee have devoted a great deal of attention to various suggestions for the assistance of aged and indigent members. The question is a difficult one and, whilst everyone desires to help those who are unfortunate, the stability of the funds must be of paramount importance in the interest of present and future members. After prolonged consideration, they came to the conclusion embodied in the following paragraph, which eliminates the "charitable" element, and enables a member to claim as a right what he might hesitate to ask as a favour. They recommend :

29. That in the case of members over 60 years of age and not less than 15 years membership, who no longer hold positions as Managers or Overseers, the Council should have power to exempt them from payment of death levies. Payment of such levies should be made from the death benefit reserve, and the amount so paid be deducted from the sum payable at the member's death.

LIMIT OF AGE FOR DEATH BENEFIT.

30. The Committee have received a communication from the Vice-President of the North Midlands Centre upon the subject of extension of age for death benefit. It was pointed out that whilst the lowering of the age limit in London after the Association had been ten years in existence was reasonable, there were many in the provinces whose first opportunity for joining arrived with the formation of a local Centre, and that in many instances the most influential men in a Centre were above the age limit, the disability being a great handicap in forming the new Centre. The writer suggested that an extension of the sliding scale principle would meet the difficulty without affecting the stability of the funds ; and that an alternative might be offered to those who cared to avail themselves of it of paying all levies and subscriptions, accruing as from the age limit period, the member adopting this alternative taking the benefit under present rule at minimum rate, subject to the usual time qualification from actual date of admission. The Committee have given careful consideration to the suggestion, and are of opinion that, up to a certain point, the concession may safely be made. They are agreed, however, that the principle, if accepted, should apply to all members of the Association, and that in lieu of the extension to 48 years now applying in new Centres for the first six months, the age should be raised to 50 all round, with a proportionally reduced benefit : and, in justice to those who have joined after 45 years of age under the present rule, the alteration, if approved, should be made retrospective, provided the members affected are willing to make payment of all levies which have arisen since the date of their election. The Committee recommend :—

31. That the age limit for death benefit be raised to 50 years, with reduced payment of £20, and £10 for full and half benefit respectively, and that this extension be retrospective with regard to members who joined under previous scale, provided that they meet payment of all levies made subsequent to their election.

General.

32. The following recommendations speak for themselves, and are submitted without special preface :—

33. That it is advisable to hold a combined meeting of the Association annually at Whitsuntide or other suitable date, and that the arrangements for such meeting should be made in turn by each section of the Association.

34. That certain evenings in each year should be devoted to debates as distinct from lectures upon questions of trade and general interest.

35. The Committee recommend that each Centre provide a Respect or Honours Board for the display of a permanent record of the names of the chief officials and those who have rendered meritorious service to the Association.

36. A suggestion has been made by a member outside the Committee that it might be possible to arrange a series of Saturday afternoon outings in summer months, by which members residing in various suburbs could unite in cycling, boating, cricket, tennis, walking, etc., in company with other members in their own district. The Committee are of opinion that while there might be some difficulty in making these arrangements from headquarters, the suggested social section of the Council would be of assistance in forming local committees for the purposes desired. They recommend :—

37. That the Council afford facilities by means of the Monthly Circular for the organisation of parties in various districts for recreative purposes.

38. The foregoing recommendations are made after very careful and prolonged consideration and discussion. Several are obviously of great importance, as affecting the future welfare of the Association and its membership. The Committee therefore, in submitting this Report to the members, earnestly hope and anticipate for their proposals a full and careful consideration.

Attendances of the Committee.

The Committee have been summoned to 19 meetings, and the following is a record of attendance :—

	Possible	Actual		Possible	Actual
§Bateman, S. M....	16	12	Gill, W. H....	19	4

‡ Elected in place of Mr. Horwood.
‖ Ex-officio members.
§ Resigned February 4th, 1913.

Signed on behalf of the Committee,
E. H. BERRYMAN, *Chairman.*

Minority Report.

The undersigned, whilst thoroughly identifying himself with all other parts of the Committee's Report, regrets he cannot support them in their recommendation of the Pension Scheme for the following reasons :—

(*a*) He cannot support the principle of compulsory contribution to a fund unless every member can claim the benefit as a right ;

(*b*) Whilst the benefit of the scheme could only be enjoyed by a very few members, the raising of the subscriptions would make it increasingly difficult for many members of advanced age, who have lost their positions, to maintain their membership ;

(*c*) Even if, as foreshadowed, certain of the pensions were allocated to the Provincial Centres, it would be almost impossible for the smaller Centres to get a member elected.

In conclusion, whilst in hearty sympathy with the Committee in their effort to tackle their problem of pensions, I cannot think the suggested scheme, if adopted, would be in the best interests of our Association.

DISCUSSION.

The PRESIDENT thanked Mr. Berryman for his introductory remarks, and the members of the Special Committee for the numerous attendances that most of them had put in. All they could do that evening was to consider the recommendations of the Committee, and he would proceed with the first essential one, contained in paragraph 6.

Mr. J. FRENCH moved an amendment to this clause, introducing the word "again" after the word eligible in the last line but one, and deleting the last three words. He thought this would be a means of inducing the more unknown members of the Association to come forward and stand for the presidency, and would be for the benefit of the Association.

Mr. R. B. HARDIE seconded, and after some discussion—during which the President explained that whatever recommendations went forward that night would have to be considered again by a special meeting called for the consideration of alterations to rules—the amendment was put to the meeting and lost. The Committee's recommendation contained in paragraph 6 was put to the meeting and declared carried.

With reference to paragraph 7, Mr. FRENCH moved an amendment to the effect that the Vice-President should not be again eligible for the same office, but he failed to find a seconder.

Mr. F. W. SEELEY proposed the insertion of the words, "or any other office" after the word "President" in the last line.

Mr. BLENKINS, a member of the Committee, seconded the addition as a little improvement to the recommendation, and the Committee's recommendation in the amended form was put to the meeting and carried.

Recommendation 8 was carried without alteration.

Referring to paragraph 10, Mr. BLENKINS proposed that the trustees and treasurer should not be eligible for re-election for *three* years, the same as the president and vice-president.

The SECRETARY said he personally entirely disagreed with the trustees and treasurer being removed from office at all. (Hear, hear.) He would much rather see the trustees and treasurer not members of the Council even than he would see them removable from office in such a short term as three years. He thought it a mistake to change their trustees too frequently, independent of the bother it would cause. He moved as an amendment that recommendation 10 read as follows:—

That the Trustees and Treasurer be elected annually, and hold seats on the Council without voting power.

Mr. T. A. CATLING seconded.

Mr. W. E. SMITH was strongly of opinion that the trustees and treasurer should be permanent officers, and as a further amendment he proposed that clause 9 and 10 in the Committee's Report be taken out altogether and the rules remain as they are. (Hear, hear.)

Mr. A. J. SMITH supported Mr. W. E. SMITH's amendment, which was eventually carried.

Dealing with paragraph 12, Mr. FRENCH proposed an amendment that eight members of the Council should retire each year and not be eligible for re-election.

Mr. SEELEY opposed the recommendation, and said his experience of the Council was that it was quite large enough. He thought it would be wiser for an extra committee to be elected.

Mr. BLENKINS said the feeling of the Committee was that they should have a larger Council to do the larger work that they suggested a little further on, and that this larger Council would be large enough to do that work and it would be large enough to split up into sub-committees. These at the same time would be in touch with one another and in touch with the Council, to whom they would have to report every now and again.

Mr. SEELEY moved that the principle of the old Council and Standing Committees stand, and Mr. W. HERMON GILL supported him.

Mr. W. MUMFORD thought the committees *a*, *b* and *c* in paragraph 14 were very essential and considered that they should be appointed annually. They could be kept in touch with the Council, provided one member of the Council was deputed to each of the committees. Then if they elected three or four members from the members of the Association annually, to work in conjunction with those three members of the Council, they would benefit the Association very much and relieve the work of the secretary, as well as the duties of the general members of the Council to a great extent.

The CHAIRMAN said this suggestion could come up later as an amendment to clause 14.

Recommendation 12 was then put to the meeting and carried.

In paragraph 13. Mr. HARDIE moved the deletion of the last sentence, but there being no seconder, the Committee's Recommendation was put to the meeting and carried.

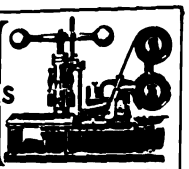
Coming to paragraph 14, Mr. SEELEY moved an amendment that the committees be appointed at the annual general meeting, irrespective of the Council, and that one or more members of the Council be added to each committee.

Mr. MUMFORD seconded.

Mr. BERRYMAN asked the meeting to reject the amendment. He considered the responsibility of appointing committees should be with the Executive Council, who should be responsible for all their expenditure. If they were going to appoint committees and give them power to make certain arrangements which would necessitate certain expenses they were going behind their Council entirely. He most strenuously opposed the amendment. It was done with a good intention, he knew, but the fundamental point was to hold the Council responsible for all expenditure.

After some further discussion, Mr. Seeley's amendment was put to the meeting and was declared lost.

Mr. FRENCH moved that Committee (*c*) in paragraph 14 read: "Technical Education and all pertaining to Technical and the Trade side of the Association."



Mr. BERRYMAN thought it was quite immaterial whether they accepted that or not, as technical education comprised it all. A trade dispute would be dealt with by the Council.

The Committee's recommendation, with a slight alteration, was allowed to stand.

At this stage the meeting was adjourned.

THE NEWSPAPER SOCIETY.—The seventy-seventh annual meeting of the Newspaper Society, was held in London, last week. Colonel A. R. Holbrook, of the *Portsmouth Times*, was elected president, and Mr. H. J. Infield, of the *Sussex Daily News*, vice-president for the ensuing year. Sir George Riddell, of the *News of the World*, was elected a member of the Council. Colonel Arthur Holbrook, the new President, is a proprietor of the *Portsmouth Times*, and has been connected with journalism in the South of England for upwards of forty years.

Trade Notes.

THE death has occurred at Blackley of Mr. W. K. Elton, one of the best-known sporting journalists in the North of England.

FOR printing and supply of stationery for the Corporation of Bristol, the tender of Messrs. Burleigh, Ltd., has been recommended for acceptance.

WE regret to record the death of Mr. Hugh Pearson, the *Daily Chronicle's* correspondent in Belfast for many years. He was one of the best-known journalists in the North of Ireland. Mr. Pearson was 47 years of age.

WE have to announce the death of Mr. Victor Hallstream, manager of the Cross Paper Feeder Co., of 92, Fleet-street, E.C., which took place at his residence at Golder's Green, on the 5th inst. We understand that Mr. David Payne has been appointed sales manager for the company.

THE death is announced of Mr. Amandus Schibsted, proprietor of one of the leading newspapers of Norway, the *Aftenposten*. Mr. Schibsted, who inherited the paper from his father as a rather insignificant undertaking, made it the widest circulated political journal of his country. He was 64 years of age.

AFTER a hearing extending over many days, the libel action by two Belfast priests and an architect against the *Belfast Evening Telegraph* came to an end on Tuesday, when the jury again disagreed. The judge asked them to retire for half-an-hour, but at the end of that time they announced that still they could not agree, and were discharged.

THE annual dinner of the Newspaper Society was held at Prince's Restaurant last week. Colonel Seely, who was present, in the course of an address said that the essential characteristic of the British Press was that while it would hit on the head anything it thought was wrong or contrary to its party, in the best interests of the State, it was prepared at all hazards to play the game.

TENDERS WANTED—By the Gas Committee of Warrington for the supply of printing and stationery. Particulars from Mr. W. S. Haddock, Gas Offices, Warrington. For providing books and stationery in the several departments for three years ending Whit-Sunday, 1916, for the Edinburgh and District Water Trustees; schedules may be obtained from the Treasurer, 12, St. Giles-street, Edinburgh.

APPLICATIONS are invited for the position of instructor to a life class in connection with book illustration, etc., at the L.C.C. Central School of Arts and Crafts, Southampton-row, W.C., for two attendances a week at a fee of 10s. 6d. an attendance. Applications must be on the official form, to be obtained, with particulars of the appointment, from the Education Officer, London County Council, Education Offices, Victoria-embankment, W.C.

ON Saturday, at Manchester, before the stipendary magistrate, Edgar Whiteley, local secretary of the National Labour Press, was charged under the Malicious Damages Act, 1861, with conspiracy in connection with the printing of last week's issue of the *Suffragette*, and remanded on bail until Tuesday week. He gave a personal undertaking not to take part in the publication of the *Suffragette* in the meantime.

Mr. A. E. JOHNSTONE presided over a meeting of committee of the North-Eastern District of the Institute of Journalists, held at the Criterion Hotel, South Shields, on Saturday last. Proposals of an important character relating to wages and conditions of work, submitted by the London District, were the subject of lengthy discussion. Ultimately it was resolved that the chairman, secretary, and treasurer be appointed a sub-committee to obtain further information on the subject, and submit the same to an early meeting of the committee.

A PRINTING CLAIM.—Before Mr. Registrar Wild, in the City of London Court, last week, a claim was made by Messrs. Waterlow and Son, Ltd., printers, 26, Great Winchester-street, E.C., against Mr. H. Baswitz, 40, Tamworth-street, Fulham, for £1 10s. printing work done. The plaintiffs' representative said that the charge was in respect of printing work done for the defendant in August, 1912. In November, 1911, the defendant gave an order to print some memorandums and articles; for that they charged £2 17s. At the same time the defendant told them there would be a likelihood of further orders and the type was kept standing. On February 3rd another order was given and a charge of 17s. 6d. was made for that because the type was kept standing. Six months later he brought a further order. The plaintiffs' discovered they had a certain amount of type standing and they had given the defendant the benefit of that and charged him 30s. for twenty copies. The defendant was now under the impression that they should have done the printing for the same price as charged six months earlier. The defendant said his complaint was that he was charged 30s. now by the plaintiffs for doing the same kind of work he had ordered of them previously. He had therefore refused to pay the plaintiffs' present account. The Registrar said he could not see what on earth the defendant was complaining about. He had given the plaintiffs an order for printing, and while they (plaintiffs) kept the type standing the defendant was given the benefit of it in the charges made against him. It seemed to him to be perfectly reasonable. He did not know whether the charges were excessive or not, but by comparing the plaintiffs' different charges he could quite understand it. The defendant must pay the plaintiffs' charges. An order would be made for the defendant to pay 12s. 6d. beyond the amount he had paid into court.

THE North and East Lancashire Federation of Master Printers held its annual meeting at the White Bull Hotel, Blackburn, last week. Mr. J. T. Foulds (Accrington) presided over a good attendance of members. The secretary's report showed that the past year had been a very busy one, necessitating a large number of meetings and conferences. The president had represented the Federation on the Council of the United Kingdom Federation, and, along with the secretary, had attended the annual meetings in Edinburgh. The following were elected officers for the ensuing year:—President, Mr. J. T. Foulds (Accrington); vice-president, Mr. George Toulmin (Preston); hon. treasurer, Mr. Joshua Duckworth (Colne); hon. secretary, Mr. Frank Ianson (Blackburn); executive, Messrs. R Seed (Preston), W. Hulme (Blackburn), J. J. Riley, J.P., C.A. (Darwen), H. W. Knowles (Accrington), Geo. Anderson (Burnley), M. Coulton (Nelson); auditors, Mr. Adamson (Accrington) and Mr. H. Smith (Rishton). Mr. Foulds was nominated on the Council of the United Kingdom Federation, and Mr. Foulds and Mr. Ianson were appointed delegates to the annual meetings to be held this year in Liverpool. During the year the number of members had been increased by the addition of the master printers of Preston.

Linotype Users' Association.

ANNUAL MEETING.

The annual general meeting of the above Association was held at Prince's Restaurant, W., last week, when Mr. Meredith T. Whittaker (president) was in the chair, there being a large attendance.

The financial statement, which was of a satisfactory character, was presented by Mr. A. R. Byles, and the Chairman, in moving the adoption of the report of the Committee, said that it showed that the L.U.A. had increased its membership and its finances were satisfactory. He emphasised the desirability of increasing the membership; it would add very much to the power of the Association. They had not had so troublesome a year as they had passed through two and three years ago, but still there had been a considerable amount of work. It was two years since they had reported the conclusion of two agreements that operated over the whole area under the T.A. The result had confirmed what many of them had anticipated, that those agreements would work for the good of the trade. But they had worked as much in the interests of the members of the T.A. and of the other associations that were interested in the hours agreement. The great advantage secured was that difficulties were now dealt with from a national point of view, and were not left to limited areas and to individual offices. No branch could by its rules and regulations over-ride the national agreement. When the Executive Council bound their members to accept a rate of 12½ per cent. as the case rate they could not insist upon a higher rate. In Glasgow an agreement with the members of the N.S.O.P.A. lapsed last year and they had succeeded in arranging another agreement. They also secured an entirely new clause which he believed would be of value. The Executive now bound itself to enforce its own rules. Their own members who ceased work in the past without notice would have to give notice or there would be a penalty of 10s. It was very little; but still it was an expression on the part of the Executive that the offending members had violated the rules. Turning to the apprenticeship question, he contended that no right existed to limit the training of a sufficient number of apprentices necessary to meet the requirements of the trade, the wastage being estimated at 700 a year. The number of apprentices in union offices he estimated at about 3,000; the employers were entitled to nearly twice the number. Concluding, he referred to the secretary, Mr. Taylor Thomlinson, remarking that it was fifteen years since he was appointed to his position. He (the speaker) had been brought closely into contact with him, and it was only his duty to say what a valuable official he was in connection with the organisation. He spared no time and no effort to give members all the assistance he could.

Mr. Byles seconded the adoption of the report and the reception of the balance-sheet, which was agreed to after a brief discussion.

The re-election of the following officers then took place:—Mr. M. T. Whittaker, president; Mr. A. R. Byles and Mr. G. E. Stembridge, vice-presidents; and Mr. W. Brimelow, treasurer.

The members were afterwards entertained at lunch by the directorate of Linotype and Machinery, Ltd., Mr. Hungerford Pollen presiding.

THE offices and show-room of the Mann Lithopress Co. are now located at 59, Walker-street, New York.

Reformed Spelling.

SIR,—I notice in your columns an article on reformed spelling with the sub-title: "A New List of Mutilated Words." It is against this title that I make protest, for it conveys, I submit, an entirely wrong impression. It suggests that to revise the spelling of a word is to maim that word. But what is a word? Surely, as Sir James Murray—the greatest living philologist—says, it is the sound. If by a revision of spelling we keep the purity of pronunciation, then a word is not mutilated at all, but made the more beautiful. Professor Pages states the matter well: "The strongest argument for a spelling that shall more nearly represent the real sounds of the words must rest on our sentiment for style and for poetry, and on a desire to bring the feeling for poetry from its false dependence on the visible in language—which is always artificial—to a dependence on the real substance of language, that is, the sound."

The article which you reprint from the *Fourth Estate* simply gives a list of changes. It does not quote the arguments behind them all. Take the first, for example: "ch" is "to suffer, and the 'h' is annihilated." But "ch" was a Latin notation of a single Greek consonant. In early and in late Latin the usual notation was "c." The simple notation "c" was common in older English (cameleon, caracter, crisolite, crisome, cristen, cronicle, ecco), and still prevails in camomile, card, cartography, cream, scar, acrostic, etc. It was the normal notation in old French and middle Latin (for example, "Magna Carata"), and is the rule in modern Italian and Spanish.

I wish all your readers would apply to me for the official list and reserve their judgment until they have read it.

Yours faithfully,
SYDNEY WALTON, Secretary,
Simplified Speling Sosieti.

44, Gt. Russell-street,
London, W.C., May 9th, 1913.

Subscribers desiring information as to the taking out of Patents are invited to write. Letters to be endorsed "PATENT DEPARTMENT," Office of the "British and Colonial Printer and Stationer," 58, Shoe-lane, London, E.C. Telegrams: Stonhill, Fleet, London.

Applications.

9,892 AVERY, F., strengthened rip-region in envelopes, paper bags, and the like.
9,954 ADAMSON, E., printing machines.
9,967 JAGER, S. C., pocket and other books with interchangeable leaves.
9,969 THIBESARD, J., advertising means.
9,972 RUSH, J. K., ink erasers.
9,977 SOC. ANON. DES MACHINES T. D. R., wiping the plates in copper-plate printing machines.
9,983 RIVERA, J. S., means adapted for printing music.
10,028 FLEISHMANN, A. D., and WADE, O., self-filling and reservoir pens.
10,055 HEYL, G. E., and BAKER, T. T., composition of inks for printing machines.
10,186 REID, S., portable appliance for cutting paper and the like.
16,226 STRACKER, S. C., method of fixing diaries, note and other books to the interior of leather or cloth pocket cases, so as to be rigidly fixed and yet easily detached and replaced.
10,318 PRICE, W. G., stylograph fountain pens.
10,362 JAHREISS, E. paper files.
10,371 TRIMMLER, C., letter files, loose-leaf binders and the like.

The Continuation School.

ONE of the characteristics of our modern legislators is the tendency to drag employers, under fines and heavy penalties, into nearly every Bill that is introduced into Parliament concerning the workers, or the education of youths and young girls. The unfortunate employer in most instances—notwithstanding the taxes he is called upon to pay towards local and national funds—is depicted in a down-trodden sphere of life, and as new schemes and new ideas spring up his position is becoming more untenable in whatever industry or trade he is engaged. The text of the Continuation Schools Bill has just been issued to the public and here again we have more threats held out for the employers, because, it says "The minimum attendance demanded at Continuation Schools is fixed at eight hours a week and employers are obliged under penalties to allow the attendance of scholars in their employ." This is practically putting the fraternal and maternal responsibilities of a family on to that of the employer, who during recent years has had the life harassed out of him with innumerable sections and Acts of Parliament, which, when combined together are not at all favourable for the progress of industry. We believe in Continuation Schools and believe they are a valuable adjunct to any industry or employer; but why employers should be threatened to be penalised for failing to carry out what is really the duty of parents, is a point in the Bill no one can conceive, except the promoters. Employers have always supported Continuation Schools financially and otherwise, because they realised they were doing the rising generation incalculable benefit, but the real counter attractions—and it is to meet these that the Bill is evidently proposed—according to a Responsible Instructor in one of the principal London institutes, are football and places of entertainment. He at the same time said "the progress of his classes were entirely due to the employers and unions connected with the industry." Therefore, it seems invidious to drag employers into the clauses of a Bill under a penalty, and at the same time ask them to lend a helping hand towards making the schools a success. Supposing a printer has 20 boys and girls between 14 and 17 years of age employed, he is expected to know that they attend a Day Continuation School and should he employ a lad say 16 years and 10 months old to do an errand—when he should be at school—that printer, or employer, under the provisions of the new Continuation Schools Bill, is liable to a very heavy penalty. Therefore, an employer must make himself acquainted with the school life of his youthful employee and guard against any encroachment on his school hours.

* * *

The Smoke Bill.

THE Smoke Prevention Bill, promoted by the Smoke Abatement League of Great Britain, has been introduced into the House of Commons by the League's President, Mr. Gordon Harvey, and passed its first reading Unfortunately industrial concerns are the target for the promoters of the Bill, who imagine that they are going to prevent the pollution of the atmosphere by abating smoke from industrial works and ignoring the household side. It has been contended time and again that the householder is just as big an offender as the factory or mill owner, and the number of prosecutions throughout the country bears out the fact. What is all the more remarkable about the introduction of this Smoke Bill is that Mr. Harvey is himself a manufacturer, and he considers that in most cases where appropriate appliances were provided black smoke could be entirely abolished and at a profit to the owner of the works. That statement may not apply to the works of all industries, because the emission of black smoke is greater in some cases than in others, and a smoke consumer may work well in one place and not in another. Certainly the emission of thick black smoke is not very pleasant in any community, but to alleviate the nuisance the household side should have been included in the Bill, and, in addition, greater prominence should have been given to the results of tests in all industries, paper and chemical included, where experiments have been made towards an abatement. Manufacturers are ever ready and willing to keep black smoke from arising from their works, but in the present experimental stage it is rather premature to be rushing a Bill through Parliament.

A Lead Poisoning Case.

In the City of London Court, before His Honour Judge Rentoul, K.C., the case of Mapp *v.* A. Straker and Son, Smith Bros., Ltd., was mentioned under the Workmen's Compensation Act, in which the plaintiff, Albert Mapp, binder and compositor, 54, Medhurst-road, Victoria Park, claimed damages against his late employers, 4, Carmelite-street, E.C., for lead poisoning caused to him while working for them. Mr. Charles Doughty, defendants counsel, said that the certificate given by the certifying surgeon, was ambiguous and therefore it was not binding on the court. Defendants could not get it except by paying for it. The dispute should really be referred to the medical referee under the Act. Mr. Arthur May, plaintiffs' counsel, said that there was no authority to do that. The certificate stated that as a fact the plaintiff was suffering from "lead poisoning or its sequelae." There was no appeal from that statement. There was no power in the medical referee to alter that. The certifying surgeon had certified that Mapp was using bronze and lead on books and was disabled from earning full wages at his work. Judge Rentoul asked if the doctor had given his reasons. Mr. May said he did. No one could go behind the certificate. The doctor could not be cross-examined on the certificate. Mr. Doughty said he certainly meant to do so. Mr. Doughty added that if it was shown that the certificate was ambigu-

Digitized by Google

ous it could not be acted upon. Mr. May said if the doctor's reasons had nothing to do with the certificate, it did not affect it. The certificate was conclusive. The defendants had had an opportunity of appealing against the certificate if they wanted, and as they had not done so it was now binding. Mr. Doughty asked for leave to extend the time for appealing. Judge Rentoul was not sure that he had the power. Mr. Doughty was not sure either. There was no authority about it. Defendants had the right to go to the medical referee. Judge Rentoul could not extend the time unless authority were produced to him. Mr. Doughty did not think he could have better authority than the words of the Act itself. If new regulations had been made by the Secretary of State then they were ultra vires. Mr. May said that the defendants could not make them ultra vires by laying by and doing nothing. Mr. Doughty observed that the certificate was bad on the face of it. It did not certify any specific disease under the Act as "lead poisoning or its sequelae" might mean anything. Judge Rentoul: Supposing the certificate has no meaning? Mr. May: Then there would not be any certificate. Judge Rentoul said that the case must be adjourned until June 9th for further discussion. Mr. Doughty asked for leave to amend the answer to the claim. Judge Rentoul refused.

AN ECHO OF

Suppression in Newspaperdom.

A *Manchester Guardian* correspondent, commenting on the suppression of newspapers, says that "in Ireland during the Land War newspapers were suppressed as easily as agrarian meetings, and not a few Irish editors had the experience of composing their leaders in Kilmainham gaol. As a child, one of my earliest recollections is seeing squads of armed Royal Irish Constabulary tearing down the sheets of Mr. William O'Brien's *United Ireland* from the dead walls and gable-ends of Cork. Under the Coercion Act that was the favourite method of publishing the paper, for booksellers who stocked it ran the chance of imprisonment, and people were held up several times and forcibly searched on suspicion of possessing a copy. No newspaper in the history of modern journalism in these countries had a more chequered career. For one thing, most of the articles were written in prison and smuggled out by visitors; and each week, as I remember, the front page contained, enclosed inside a mourning border, a list of the members of the staff under arrest, ranging from the editor to the machine-man. Irish printers dared not undertake publication. English firms which had been approached were forced by threats of prosecution to refuse the contract. Finally it was arranged that the paper should be set up in France, and an elaborate scheme was worked out to evade seizure of the copies by the police, who were watching every port and railway station. The parcels were sent out with the French fishing fleet, transferred to the Cork luggers in mid-Channel, and through the agency of the Land League scattered broadcast over Ireland. In the long run the Executive found that, though it was easy to order the suppression of a paper, to suppress it was a different matter. No one who wanted to know what William O'Brien was saying had much difficulty in satisfying his curiosity, and the element of risk merely gave an added savour to his fiery philippics."

MULTIPLE MAGAZINE LINOTYPES

EFFICIENT
RELIABLE
ECONOMICAL
ELASTIC
ADAPTABLE

¶ These machines enable users to set an endless variety of Job work —high-class work— quickly and economically.

¶ As many as Twenty Alphabets may be set from the standard keyboard of ninety keys.

¶ Additional combinations of type-face may be obtained by rapid magazine change.

¶ Multiple-Magazine Linotypes are excellent composing machines for offices where frequent changes of face are necessary.

¶ The Linotype is profitable to *every* Printer

Financial.

Offices of the *British and Colonial Printer and Stationer*,

58, SHOE LANE, LONDON, E.C.

WEDNESDAY, May 14th, 1913.

ANOTHER holiday has shortened the financial week, and comfortable conditions have remained unchanged. Credit is in ample supply, and the tendency easy in both the loan and discount markets. With the exception of a purchase of £82,000 in bar gold last Thursday, there are no gold movements to report this week. In the open market bar gold totalling £850,000 will be available to-day, of which India and the trade will take £250,000, and the Bank should get the balance. In stock markets dealings have been on a very small scale, but the tendency keeps cheerful. Consols have advanced a little this week, the quotations now being 75⅛ to 75¼ for money, and 75¼ to 75⅜ for the account.

The miscellaneous industrial market was very idle before the Whitsun holidays, and has reopened with a continuance of the quiet and uninteresting conditions. In the section relating to paper and print we have little business to record, but there have been one or two small upward movements in our list of shares. Amalgamated Press Ord. are up 1/16 to 6⅝—6⅞ xd.; Waterlow and Sons Pref. Ord. have risen ¼ to 11½—12½, and Waterlow Bros. and Layton Ord. have also gained ¼ to 5½—6½. Business has been done during the past week in Amalgamated Press Pref. at 21s. xd.; in Associated Newspapers Pref. at 20s.; in Eyre and Spottiswoode Deb. at 82½; in Ilford Ord. at 13s. 6d. and 13s. 6d.; in *Illustrated London News* and *Sketch* Ord. at 4s. 3d., and in the Pref. at 14s. 6d. and 14s.; in International Linotype at 82½, and 81; in Linotype and Machinery A Deb. at 57; in Edward Lloyd Pref. at 22s. 6d., 22s. 3d. and 21s. 9d.; in George Newnes Pref. at 15s. 3d.; in C. Arthur Pearson Pref. at 70s.; in Raphael Tuck and Sons Pref. at 100s. and 98s. 9d., and in the Ord. at 18s. and 16s. 9d.; in Waterlow and Sons Pref. at 11⅜, and in the Cum. Pref. at 7⅝; in Waterlow Bros. and Layton Ord. at 6⅛; and in Weldons Ord. at 31s. 9d.

Holders—H. Wilson, Hawthorne-street, Macclesfield, and J. M. Pinder, 265, Copster-hill-road, Oldham.

W. M. POWER, LTD.—Particulars of £2,000 debentures, created April 14th, 1913, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged—the company's undertaking and property, present and future, including uncalled capital. No trustees.

WILSON AND WHITWORTH, LTD.—A memorandum of satisfaction to the extent of £2,000, on October 2nd, 1912, of debentures dated May 11th, 1905, securing £5,800, has been filed. (Notified April 30th, 1913.)

COMMERCIAL INTELLIGENCE.

Re C. E. ETTI.

East and West Publications.

Under a receiving order made against this debtor, described as a company promoter, of 490, Uxbridge-road, and 102-4, New Oxford-street, W.C., the first meeting of creditors was held last week, at the London Bankruptcy Court. Mr. E. Leadam Hough, senior official receiver, reported that the debtor's preliminary examination had not been completed. It appeared, however, from the statement obtained, that a previous failure was recorded against him in 1907, no dividend was paid, and the debtor had not obtained a release from those proceedings. In July, 1908, he became manager and editor of a financial paper styled the *Investor's Mart*, and which belonged to Mr. Julius Niedermayer, who carried on business as J. West and Co., at High Holborn. Shortly afterwards Mr. Niedermeyer agreed to float a company to print the paper, if the debtor could provide a part of the capital required. His wife put £500 into the concern, and a company was formed under the style of the Holborn Printing Co., with a nominal capital of £1,000. Mr. Niedermeyer failed to find the balance of the capital required, and matters came to a standstill. The debtor remained with the company for six months

Valuations for Fire Insurance and other Purposes.

71, FLEET STREET, LONDON, E.C.

2 SALES BY AUCTION of PRINTING PLANT and MACHINERY by Mr. ROBERT H. RUDDOCK, Printers' Auctioneer and Valuer, 71, Fleet Street, London, E.C.

1.—RICHMOND, SURREY.

Re The New Rapid Electric Printing Co., Ltd.
By Order of the Receiver for the Debenture Holders, P. E. Metzner, Esq.
Eton Street, Richmond, Surrey.

Mr. ROBERT H. RUDDOCK

IS favoured with instructions to SELL BY AUCTION, on the premises, as above, on MONDAY, 19TH MAY, 1913, at 2 o'clock, Valuable LETTERPRESS PLANT AND MACHINERY, including:—Nearly new Demy Wharfedale Printing Machine, by Bremner Machine Co., with fliers, etc.; Foolscap Folio Anglo-American Arab Platen Printing Machine, by J. Wade; Double Demy Columbian Press; Iron Imposing Surface; 1-h.p. and ¼-h.p. Electric Motors, 200 volts; 26-in. Diagonal Guillotine, by Furnival; two Wire Stitching Machines; 1½ tons Book and Jobbing Type; Chases; Galleys; 7 Frames; Assortment of Wood Letter, etc.

On view morning of Sale, and Catalogues of Messrs. Metzner and Sprague, Chartered Accountants, 40, George Street, Richmond, Surrey; and of the Auctioneer, 71, Fleet Street, London, E.C.

2.—BELVEDERE PRINTING AND PUBLISHING CO., LTD.

1 to 3, Plough-court, Fetter-lane, London, E.C.

Mr. ROBERT H. RUDDOCK

IS favoured with instructions, by H. Wingfield, Esq., to SELL BY AUCTION, on the premises, as above, on TUESDAY, 20TH MAY, 1913, at 11 o'clock, the valuable and extensive LETTERPRESS PLANT AND MACHINERY OF THE BELVEDERE PRINTING AND PUBLISHING CO., LTD., comprising:—THREE DUPLEX SINGLE LETTER LINOTYPE MACHINES; No. 4 Quad Crown Miehle Two-Revolution Press; Quad Demy Wharfedale Printing Machine, by W. Dawson and Sons; Quad Royal Wharfedale Printing Machine, by W. Dawson and Sons; 5 Quad Royal Gripper Perfecting Machines, by T. Middleton; Quad Demy Gripper Perfecting Machine, by T. Middleton; Demy Folio Mitre Platen Printing Machine, by Dawson and Sons; Crown Folio "Improved Franklin" Platen, by Cropper, Charlton and Co., Ltd.; 42-in. Express Self-Clamp Guillotine Paper-Cutting Machine, by Furnival and Co.; 32-in. Star Self-Clamp Guillotine, by W. Dawson and Sons; Two No. 4a Reel Wire Stitchers, by Aug. Brehmer; 30-h.p. Electric Motor, 440 Volts; 2¼-h.p., 1-h.p. and ½-h.p. Electric Motors, 400 Volts; 12-h.p. Otto Gas Engine, by Crossley Bros., Ltd.; Shafting, Belting, etc.; Complete Stereo Plant; Disc Planing Machine; Back Planer; Stereotyper's Hot Press; Jig Saw and Drill; Demy and Royal Folio Casting-Boxes; Two Melting Pots; Circular Saw Bench; Shooting Board and Plane; Gauges, etc.; Double Crown Albion Press; Crown Folio Albion Press; Crown Columbian Press; Two 10-in. Roller Galley Presses; 8-in. Roller Galley Press; 19 Iron Imposing Surfaces; 4 Wood Letter Cabinets; 5 tons Book and Jobbing Types; 1,050 Cases; 540 Wrought and other Chases; 400 Solid Brass and other Galleys; 750 doz. Wood Letter; 9 tons Lino and Stereo Metal; Fixtures, Fittings and Office Furniture; 2 Typewriters; Rotary Neostyle: 3 Roll-Top Desks; Mahogany and other Writing Tables; Iron Fire-Resisting Safes; Platform Weighing Machine; Stock of Paper, Inks, etc.

On view day prior and morning of sale, and Catalogues of Messrs. Fairburn and Wingfield, Chartered Accountants, 67, Watling-street, E.C.; of Messrs. Heywood and Ram, Solicitors, 222, Strand, W.C.; and of the Auctioneer, 71, Fleet Street, London, E.C.

Digitized by Google

to look after his wife's interest, and then resigned his appointment; the company went into liquidation, and the loss to the debtor's wife was estimated at about £600. The debtor next went to China, where in November, 1911, he obtained a concession from the chief of 72 Guilds of China to open branches for promoting trade with China, and to publish the *East and West Review*. A company was formed in February, 1912, under the style of the East and West Society of China, Ltd., to take over and work the concession; registered offices were opened at 102-4, New Oxford-street; the share capital was fixed at £1,000 and the debenture capital at £5,000. The debtor had no shares in the company, but was a creditor for a few hundred pounds for salary due and services rendered. The paper, a monthly one, is being published, and the company is still carrying on business. The meeting was adjourned for three weeks with a view to obtaining the attendance of the debtor and a representative body of creditors.

A WORD OF CAUTION.

In giving the official Gazette information, it must be distinctly understood that we take official records as we find them, and accept no responsibility for inaccuracies, while, as an almost invariable rule, the facts will be found correct. We advise our readers, before forming hasty judgment, to consider that there may be in each case a satisfactory explanation which does not appear on the records.—Ed.]

ORDER MADE ON APPLICATION FOR DEBTOR'S DISCHARGE.

CHARLEY, F. H, lately of 31, Hilldrop-crescent, Holloway, London, N., journalist. Date of order, April 9th. Discharge granted subject to the following condition to be fulfilled before his discharge takes effect, viz.: Bankrupt shall, before the signing of the order, consent to judgment being entered against him in the King's Bench Division of the High Court by the official receiver, for the sum of £5, being part of the balance of the debts provable in the bankruptcy which is not satisfied at the date of this order, and £1 10s. costs of judgment, and that, upon the required consent being given, judgment may be entered against the bankrupt in the King's Bench Division of the High Court for the sum of £5. Note.—£5 paid to the official receiver in lieu of entering up judgment. Public examination concluded February 19th, 1913. The grounds named in the order for refusing an absolute order of discharge were that the bankrupt's assets are not of a value equal to 10s. in the pound on the amount of his unsecured liabilities.

QUADS.

[We do not necessarily identify ourselves with any opinions of our contributor. At the same time, readers will not need to be assured that he always endeavours to communicate something worthy of attention.]

"I hold every man a debtor to his profession, from the which, as men do of course seek to receive countenance and profit, so ought they of duty to endeavour themselves by way of amends to be a help and an ornament thereunto."
FRANCIS BACON, Baron Verulam.

"Hazell's" are thinking of moving their works to Ireland.

o o o

As to which however I'll remind you of the chestnut about the train traveller bored by the curiosity and "gab" of his train companion. He at last explained that what he was taking with him in a wicker case in that carriage was--a mongoose! "They're death on rats you know, and my brother sees rats. Ah well, yes, as you say, they're not *real* rats, but then that isn't a *real* mongoose."

o o o

Mr. Howard Hazell speaks of moving his works to Ireland, because of certain letters and speeches or questions at last week's Dublin Costing Congress. They carried references to small country printers in Ireland having no rent to pay; and to a certain class of printers "getting orders without any travelling costs," and to the absurdity of entering a lot of costs for for your dynamo when your own gas engine supplies its prime power, and so "you get that power for nothing."

o o o

These were not *real* escapements from cost. But then the Hazell intention to move to Ireland and avail of these escapements is not a real intention either. It served as good platform badinage.

o o o

As speaker he served all his beef with mustard. Always a good thing in a speaker or writer. Some, to be sure, serve mustard without beef. He couldn't do that if he tried.

o o o

Yes, Ireland is a delightfully, and at times a tragically quaint land; witness the tale I heard to-day as I was whirled by the swelling Mourne mountains and wide gorse-lit fields or commons at their feet.

o o o

"A man I know," said a fellow traveller, "was told to take out a grey horse instead of a dark horse to plough with, and rather than do it, turned up his job at once. He'd five children, and there was nobody else who could give him employment."

o o o

I was assured that was typical of the countryside. I suggested a few doubts. Was the man quite *compos mentis?* He might be fit for just such a job; hardly any other. Was the horse he was unwilling to work, lame, and he too stupid or too fearful to tell the exact truth about it? Could he have been ordered to do something else for an hour while he got over his possible stupid "cussedness. And was it not a dreadful thing that any man with a family should have but one chance of getting employment in all that countryside.

o o o

Apropos of visiting the extremest punishment upon the offence of the dull wit, I recall how a lesson was taught to some of us by Bishop Wilberforce, of Oxford, forty years ago. "I was confirming some lads in the country. I thought I recognised one boy. I bent over him and said 'My boy, haven't I confirmed you before?' He looked up at me and said, 'You be a loo-iar.' I went on confirming him; for I've been a country parson, and I knew quite well that it was only his way of saying 'My lord, you're labouring under a misapprehension.'"

Will all please note who are inclined to flare up the moment they are awkwardly addressed by ignorant and boorish fellows who have never had their chances of education or of contact with men and affairs.

o o o

Rider Haggard would have managed that episode better. I once heard that novelist-squire tell how he wanted to put in certain flowers at a show. His gardener, for some reason of his own, didn't want to send them in. Rider Haggard didn't flare up and dismiss him straight away. He wasn't worrying so much as all that about it.

o o o

And he had his reward. The gardener relented after all, and sent them in, saying to his master, "I suppose you're like all the rest of the gentlemen; you do like to get your name in the papers just once in a way!"

o o o

Rider Haggard got the memory of a good joke as against the other man's memory (if he ever gave it a thought) of a broken and destitnte family.

o o o

Here's a health to you, brother O'Fletch;
Slainte an' slainte an' slainte to match.
Print reform praycher an' powerfullest teacher,
And kindliest crather in Street Donegal.

o o o

I called at Donegal-street, Belfast, at the *Irish News* office, and there saw Mr. Fletcher; and also saw him at his home. He had to be drawn on the subject of his book on the conduct of a country newspaper; but as I did probe a bit I was glad to find that several hundreds had been sold. I think it is a shilling book; his address is 58, Brookvale-avenue, Antrim-road. It is very valuable to those who are contemplating starting a local newspaper, or improving one they have. It speaks with minute knowledge on the printing, engineering and printing equipment matters involved.

o o o

"Got another skeleton in the cupboard," I asked; thinking it time he'd skeletonised out another work. "No; not just yet." I take it, indeed, his main interest at the moment is in the newspaper machine he has invented. As to which it seems a question whether it will be made first by some British or American engineers.

o o o

The two-revolution principle comes in. There are four cylinders in succession on a flat bed. No. 1 continuously revolving in the same direction like the cylinder of a Miehle, prints with half its circumference and misses with half. So, too, No. 2 prints with half and misses with half. The sheet is then led right on to the end of the machine, when it is brought back towards the centre. The fourth cylinder, that is the fourth in order of ranging, and the third in order of operation, prints with half its circumference and misses with half. So, too, the remaining cylinder; and when this last has done its part the printed sheet is delivered in the middle of the machine as is the case with the old Jumbo drop-bar or gripper perfectors.

FRANK COLEBROOK.

THE Douglas printers have had their wages advanced. The jobbing and machine hands by 2s. 6d. a week, and the linotype operators by 1s. 6d, with a reduction of hours for the latter from 50 to 48. The original demand was for 38s. (instead of 35s.) for the linotype operators, and 33s. 6d. (instead of 30s.) for the others.

The Printing Crafts Guild.

Visit to the Broadheath Works.

In true Manchester meteorological conditions over sixty members of the Printing Crafts Guild journeyed to Broadheath to see the latest advancements in printing machinery, at the extensive works of Linotype and Machinery Limited. Messrs. J. E. Billington, F. W. Wright, and W R. Speechley, met the party, and each took a score of followers of print for a two hours' peregrimation through the works.

The first machine to receive attention, after a careful examination of all the tools and appliances for accurate production of work, was

The Linotype.

This machine stands high in the estimation of the trade. The manufacturers are a progressive people and are always adding to its usefulness. If any one had told us a quarter-of-a-century ago that a mechanical machine would be on the market in 1913, producing eight different founts of type at the sweet will of the operator, we should have been inclined to ask him in what part of the satanic kingdom he had met Ananias. The machine at the present day can be counted in thousands and like the ubiquitous Scotsman is found. wherever newspaper and tabular matter abounds. Take the little piece of brass we call a matrice: when we go into the details of its production we learn that some forty operations have to be performed before he is presentable for assembling with the family in the magazine. Truly they must be like the sand on the sea shore, when we find that some six million annually migrate to all quarters of the globe, We have all seen or heard of the Simplex, the Duplex, Model 4 and Model 9, which is producing some eight or nine faces of type in the office of *The Manchester Guardian*. This is not the be-all and end-all of this wonderful machine, for a little bird whispered to us that a Model 15 is growing, and may be heard of before the next Printing Exhibition which is to be held in London in 1914. We scrutinized some work done from Linotype bars and the register on the six colour job, which at a future date may be seen in a specimen book, all showed accurate alignment.

The Autoplate.

Since its advent some thirteen years ago this machine has gradually asserted itself upon the progressive newspaper houses, and where it has proved itself too large for the smaller firms its "Junior" has filled up the vacancy.

The L. and M. Rotary

Is one of the most perfect machines of the day, and the design and construction of the cylinders show that the company fully realise that upon the accuracy, solidity and unison of their revolutions depend not only the impression, but also the delicacy of the finished work. The plate and impression cylinders are ground perfectly true, and turned down in similar bearings to those upon which they run in the machine. Accessibility to the plate is one of the most important advantages, as it can be either washed or taken off with the utmost facility. The speed of the machine is only limited by the ability of the layer on.

The L. and M. Offset.

Like all other productions of the company, the demand is so great that orders have to be refused, and as soon as a batch of machines are ready they are sent to their respective destinations. We were unfortunate in visiting just after one of these outgoings, and so had not the pleasure of a close observation.

"The Miehle."

The demand for this machine is so great that batches of twenty at a time are put through the works. When a staff is kept month after month manufacturing and finishing one part, be it bed or cylinder, this must necessarily make for higher perfection, and one great advantage to the printer is that in the event of an accident he can rely upon receiving any particular part almost immediately, so that his machine may again be running with the minimum loss of time, all parts being interchangeable. High grade machines live upon their racks and gears, and if not perfectly made and fitted there is liability to undue wear and strain. Every individual part of the Miehle machine is tested, so that when it is finally placed in the printing office, after having been through numerous severe tests, it may be confidently expected that each portion will run in perfect harmony.

"The Centurette."

This little machine devours all the small work that the Miehle passes by. It embodies the main features of the parent press and at the same time possesses features of its own, and is not merely an imitation. It is constructed mainly for speed and has a maximum capacity of three thousand impressions per hour. It is built with the purpose of doing away with a good deal of the tedious process of making ready, for which the defects in crudely constructed presses are so often responsible. The ink distribution is so good and the rolling power so effective that high-class work can be depended upon. It is one of the simplest machines built, and a prominent feature is its small number of working parts and adjustments. At the same time it must be noted that the improvements and its mechanical advantages in bed movement enable it to be run with perfect safety at the high speed that is claimed for it.

The company have now in hand some large extensions to their present extensive works and find it necessary to keep putting up substantial buildings, because the orders flowing in are more than they are able to meet. It shows that "accuracy," which seems to be the motto of the company, brings its reward in orders and repeat orders.

A pleasant surprise after our exploration was the announcement that tea was ready. We adjourned to the dining hall, where Mr. F. A. TAYLOR, in a brief but racy speech, welcomed the members and asked them to forget the climatic conditions outside whilst they attended the wants of the inner man.

When all had partaken of the good things provided and drank from the cup that cheers but does not inebriate,

Mr. J. E. BILLINGTON said that printers' engineers were like printers because they had to depend upon the public, and should the demand for printing be small, it naturally followed that orders for machinery and other supplies would not be placed. At the present moment trade was booming and he hoped it would long continue, Speaking of the products of Linotype and Machinery, Ltd., he said they were equal to any in the world; and further, although the engineers of a byegone age were accurate in their workmanship, yet those of the present age knew the extent of their accuracy. There was no more exacting business than that of printing, and it behoved engineers to be exact because any defect in workmanship might spoil what otherwise would be a valuable printing machine.

President R. B. FISHENDEN moved a vote of thanks to Linotype and Machinery, Ltd., for the privilege of inspecting the works, and for their hospitality in providing tea for the members. He said the works represented the very top notch in the matter of accuracy and refinement. Some of the machines were almost human in the finishing of their work, and it was no wonder that there was such a great demand at home and abroad for the Linotype, the Miehle, the Centurette and the Offset machines. He also thanked Messrs. F. W. Wright, J. E Billington, and W. R. Speechly for acting as guides and friends to to the party.

Secretary F. J. HUGHES, in seconding, carried the audience back to the days when the Linotype machine was built in Manchester. The growth of the firm had been rapid, and by the great extensions that were at present going on it was easy to see that as much, if not more, care and attention was given to every little detail in the construction of the various machines. He was sure those present would agree with him when he wished Linotype and Machinery, Ltd., long and continued sücccss.

Mr. F. A. TAYLOR, in returning thanks on behalf of the company, said the real success of the company was the starting and finishing of orders in as few days as possible. A good many printers received orders and they let them drag through the office until all interest and energy were gone, and sometimes the job did not get finished. He remembered a man who patented a new motor and placed orders with some engineers for 3,000. Months dragged on and on, and he got 50 now and 50 again, and at the finish he got so enraged that he told the engineers that if they did not alter their speed the order would not be completed before the second coming of the Messiah. Mr. Taylor finally closed with the remarks that his company was confident they could give any printer the right thing in the shortest possible time as soon as the printer entrusted his wants with them.

BOOKBINDING SECTION.

Bookbinding Notes and News.

The members of the Master Bookbinders' Association lunched at Cannon-street Hotel on April 23rd, and the annual meeting of the Association was held subsequently. Mr. Frank E. Bailey (Bailey Brothers) presided over both functions, and those present included Messrs. J. G. Bain (A. W. Bain and Co.), Henry A. Alldis (E. Symmons and Sons, Ltd.), Hubert G. Kelly (Kelly and Sons), H. K. Judd (H. K. Judd and Co., Ltd.), A. C. Nevett (Nevett Brothers), Ernest Straker (A. Straker and Sons and Smith Bros., Ltd.), H. E. Simpson (Geo. Simpson and Co., Ltd.), H. G. Hodgman (Novello and Co., Ltd.), C. W. Forward (C. W. Forward and Son, Ltd.), H. J. Mercer (Trickett, Westleys and Co.). Amongst members and guests who were unfortunately prevented from attending were Messrs. Robert Leighton (Leighton, Son and Hodge, Ltd.), W. T. Birts (Watkins, Watkins and Co., Ltd.), J. Abel (The Ship Binding Works), F. Gruneisen (F. Gruneisen and Co.), J. W. Webb (Webb, Son and Co., Ltd.), E. J. Trevett (Henry Frowde), and Cecil R. Harrison (Harrison and Sons). After the usual loyal toasts, Mr. A. C. Nevett (Chairman of the Bookbinding Section of the London Chamber of Commerce) proposed "Success to the Association," pointing out that whilst bookbinders found their connection with the London Chamber of Commerce of very great value in regard to labour matters and their relations with the official world, the Association fulfilled a very useful function with respect, more particularly, to the relations of bookbinders with their customers. At the meeting which followed, the annual report and accounts were received and adopted, the former bearing evidence of the fact that the Association, although only yet in its infancy, has already accomplished some very practical work. There are few firms of any importance in London whose names are not now included in its roll of membership, and the uniform action which is likely to result cannot but be of material benefit to the trade.

Mr. Cyril Davenport presided at the last dinner of the Miscellaneous Bookbinders' Association, at the Florence Restaurant. Comparing English and French bindings, he expressed the opinion that they were equally good, and he noted with satisfaction the recent revival of inlaying the designs with "jewels," a method which he thought was capable of considerable development. He deplored the use of inferior paper and leather, and stated that at the British Museum he had for some time past discarded calf and only used acid-free morocco leather. Mr. Charles W. Forward, in proposing the health of the Chairman, congratulated the members upon securing a gentleman who represented all that was artistically best in regard to their craft. The toast was drunk with enthusiasm. An excellent musical programme was provided. Amongst others who spoke and were present were Mr. Cedric Chivers, Mr. C. J. Thynne, Mr. Arthur Calkin, Mr. Zaehnsdorf, Mr. W. Morrell, Mr. F. E. Bailey, Mr. Hubert Kelly, Mr. de Coverly and Mr. Harold Shaylor.
